In support of his thesis, Bentham appeals to psychology; he finds pain and pleasure by reference to differences among individuals, as a means of discovering rules by which pleasure and pain are either directly secured and pain avoided, and thereby the highest possible amount of happiness obtained. These rules attain to universal validity by means of the various sanctions—natural, social, political, and the religious—the authority of which, again, is derived from the principle of sympathy associated respectively with obedience or disobedience to the rules themselves. The pleasure and pain, hope and fear, are made the motives for the observance of the very laws which are designed to secure the greatest happiness. Here morality becomes a doctrine of prudence—the art of calculating the greatest happiness.

A simpler and less artificial form of the theory that the ethical motive is formed by the pleasures and pains connected with the instinct of self-preservation is found in the doctrine that unrestricted competition always gives the victory to the fittest, and that, accordingly, moral progress is the result of natural selection. For, after all, it is the instinct of self-preservation, which has designed the struggle that struggles for existence in which the strongest survive. The dynamic of social progress is thus found in the desire for power.

Another variant of naturalistic ethics would found morality upon a combination of self-love with the social instinct—a favourite resource with the Scottish School, who, after the example of Cumber land and others, put natural beneficence on a level with selfishness. According to the Scottish School, moral goodness springs from benevolence—the sympathetic impulse—which produces the immediate reflex-feeding of approbation.

This principle holds a special place in the theories of Hume, and David Hume. Morality rests upon sympathy—sympathy first of all with one's own motives; it is really the acting on one's own impulses, and is formulated in general rules. Of decisive importance for morality are those emotions which are designed to temper the others, particularly hope and fear. Hume traces national character, love of fame, and the imitation of fashion, by custom and tradition as expressions of the sympathy that subsists between successive generations. To all these instincts, he adds the existence to sympathy—to the sense of a common weal; and to custom, in the form of loyalty to the laws and the authority.

But, just as Hobbes was unable to ignore the social factors in morality, so those who grounded their ethics upon sympathy cannot leave the purely individual interest out of account; and thus, while sympathy with what produces the good or evil of others is the determinative factor, it is laid upon the satisfaction experienced by the individual who yields himself to that sympathy.

Herbert Spencer, too, places altruism, which rests upon the social impulse, above egoism, though from a somewhat different point of view, asserting that men, after long experience and by means of the discipline which connects pleasure and pain with the growth of the social and sympathetic propensities, finally comes to see that, by aiming at the good of others and the common good, he really serves his own ends better than by inducing his own egoistic impulses. J. S. Mill also makes happiness the leading principle of his ethics, and lays the chief emphasis upon the adjustment of the individual interest to the general interest. J. S. Mill, one of the French representatives of the ethics of sympathy, called attention to the fact that in the last resort it is the harmonious development of the human being which is good—though in such manner that we combine private with public ends. It is the individualist by nature, the indestructible moral urge of the human soul, the personal interest only by passion, and it is, therefore, of importance that the higher passions be regulated by habit, and that, in particular, the selfish, by its appeal to pain and fear; and even mould them, and by its discipline counteract the work of chance. Hobbes (Spinoza) believes that reason is nothing but the capacity for selecting the passions which conduct to happiness. At a later period Comte, Taine, and Littre based ethics upon the principle that the sympathetic impulses of altruism ought to prevail over egoism, thus establishing, in contrast to the English view, the ascendency of the social over the individual factor. Feuerbach likewise held that morality rests upon the desire of happiness, upon a reconciliation of the selfish and the social (Emmanuel), and he pedantically tinges the theory of Schopenhauer—practically that of Buddhism also—which regards pity as the source of morality, may be classed as a variant of the sympathetic hypothesis.

(d) In sharp antithesis to the foregoing views stands Rationalistic ethics, which would reduce the emotions to their lowest level. But if the ethics of emotion cannot explain the actions of the intellect, neither can the Rationalistic school disregard feeling; for it is a fact of everyday observation that emotion is controlled only by emotion, and that the will is never moved by pure reason alone.

Spinoza and Kant may be taken as representatives of this Rationalistic view. Spinoza sets out from self-conservation. The absolute Substance, with its attributes of thought and feeling, is something active, and the various modes share, and maintain their existence, in this activity; in so
far, however, as these modes are finite, they are wrought upon by others, and suffer. To this suffering proceed and confused ideas of imaginations; and from these proceed the perverted emotions that rest upon the errors of an understanding subject to suffering. The primary affections are pleasure, pain, and, in relation to the future, desire. Pain we associate with pain and confusion; the desire and pleasure, with increment. But we judge things wrongly, in so far as we regard them from our own restricted point of view. Spinoza gives a magnificent example of how false and perverted the affections are derived from the primary forms—by their relations either to time, to their respective objects, or to each other. The characteristic idea of this definition is that, when man is under the inexorable control of the affections which may co-exist in a state of strife, he is in a condition of servitude. Accordingly, these affections are without value for moral ends, and must be cast aside. This is accomplished when we regard all things sub specie aternitatis, by means of the amor Dei intellectualis, the adequate ideas which dissolve the imaginations, and the activity of our reason exerts an interest above the passions. The true good does not war against happiness; it shares in the active self-conservation of God, and reveals itself as creative intelligence. In this activity man is satisfied and blessed; he has the acceptance of God, and is therefore happy, hilarios. Spinoza thus excludes the affections in so far as they rest on suffering, and will recognize only the happy consciousness that is bound up with the soul's own pure activity. So long as man is subject to the domination of the affections, it is well for him, in the interests of society, to let the more harmful be kept in check by the less harmful; as, for instance, when the State resorts to the fear of punishment, or concedes a partial indulgence to the less noxious affections, in order to counteract a greater danger by a less. The ethical view, however, goes deeper: it has regard only to the pure activity of the soul, with its attendant blessedness. According to Spinoza, therefore, the essential constituent of morality is the subjection of the affections to the authority of reason, which frees itself from the imagination and keeps watch upon their inner movements. It is unnecessary to point out how closely he is allied to the Stoics.

The ethics of Kant, based upon the autonomy of the a priori practical reason, sets aside every motive that rises from inclinations and passions. The only true ethical motive is reverence for the moral law. Kant's aversion to desire is such as lays him open to the charge of dualism, and gives an ascetic character to his ethical teaching. On analysis of this reverence for the law, however, we find that the element of feeling is by no means ignored. For, according to Kant, the moral law ought to kindle in our hearts to a nobler pleasure, involving us with a true pride in the majesty of our practical reason, while also humbling us for our shortcomings. It is, in fact, this inner discord which gives rise to the sense of reverence for the law. Further, in the Critique of Judgment, Kant assigns an even more important function to emotion, basing the aesthetic judgment upon a spontaneous feeling, which he holds to be purely intellectual in character. This aesthetic judgment of emotion, again, with its claim to universality, he regards as preparatory to morality, as it habituates us to the love of the beautiful apart from any sensuous interest, and even to admire the sublime in opposition to any such interest.

A corresponding intellectual interpretation of morality was upheld in England by Dugald Stewart and Clarke, who take their stand upon the intrinsic necessity of the moral relationships. According to Clarke, there exist eternal, unchangeable, and rationally instituted laws of righteousness, equity, goodness, and truth, which, like Kant, he combines with the idea of future retribution.

(e) Synthetic or Mediating ethics.—In England, however, the representatives of an a priori Rational ethics are eclipsed by those who would combine reason and emotion, of whom the most outstanding is Shaftesbury. Shaftesbury goes back to a 'moral sense'—a feeling of self-appreciation which attaches to the equipoise between selfishness and benevolence. When this equipoise, this self-appreciating sense of satisfaction, becomes the object of thought, a judgment of approval is the result. In the harmony of our being, therefore, we discover an ideal of perfection, which, as appropriate to our nature, also involves a state of happiness. Religion, too, is estimated according to its capacity of strengthening or weakening our moral feelings. The Deity, being imminent in Nature, is the source of that cosmic harmony which finds an echo in our moral constitution. In fact, philosophy itself, according to Shaftesbury, is a passion for all that is good and beautiful. We are always seeking for unity and bond—the bond of nature—and it is likewise these that we aspire to in the moral field—especially in the sphere of our emotions. We ought never to be moved to action save by inclinations that are worthy of the good in us. This tendency is a disposition and an attitude of harmony with the system of which we form a part. Hence the propensities which make for the good of the whole should restrain those that are self-contradictory, since our individual good is involved in the general good. It is love, it is enthusiasm for the good, that elevates man; the enjoyment of love and friendship is really a participation in the harmony of the universe. Shaftesbury was wholly optimistic, believing, as he did, in a world-soul that works towards universal harmony and animates mankind. As against the sensualistic tendencies of his time, he speaks in the name of the rational, insisting upon harmony and unity, and yet not repudiating the affections, without which a moral life is, as he thinks, impossible.

While Shaftesbury holds strongly to the conviction that virtue is the manifestation of what is good in us, Price would rather emphasize the idea of duty. The latter derives morality from the primordial consciousness of obligation, and thus makes it its own support; it is not to be traced to states of feeling, but to its being controlled by reason. But though the ethical rests upon the rational, yet its operation is so far conditioned by emotion—by a lively spontaneous feeling that gives intensity to the process of rational intuition.

The intuitive Scottish School likewise founds morality upon immediate rational perception. Thus Dugald Stewart defines the ethical as a tendency now becomes a principle—to act under the authority of conscience. The moral can be apprehended only by a direct intuition in conscience. Pity and sympathy lend support to this intuition, and begat an inclination to follow the lead of conscience. A similar attempt to conjoin rational intuition with emotion was made by James Mackintosh, who held that feelings of pleasure and displeasure in matters of character, so far as these feelings become springs of action are given in conscience, which contains the norm for our conduct, and which is perfected by a process of reflection that clarifies these immediate judgments of feeling; while, again, the naturally strong tendencies urge us to obey the behests of the inner monitor.

In Germany the endeavour to bring the emotions within the scope of ethical rationalism has
been made in various ways by Leibniz, Schiller, J. G. Fichte, Herbart, Schleiermacher, and others. Like Shaftesbury, Leibniz is an optimist, and has a very mild form of the feeling that it is for our own established benefit to cultivate the emotions of the monads, the highest of which, since they can increase the intelligence which constitutes their nature, are capable of being improved. For instance, he said: 'I am of the opinion that perfection, at becoming an increasingly clear and rich reflection of the world, which we have regard to the others; each will rejoice in its own self-preservation only as it yields itself to the social impulse—the craving for the universal and to the force of love. This longing exists in every rational being, and is rooted in the nature of the understanding.' It is in this last, of which we speak, this way Leibniz combines the natural and rational desire for perfection with the desire for happiness. The two are not at variance, for the intelligent monad cannot attain happiness save in harmony with all. Reason is then both in accord with the natural impulses, and both work into each other hands in the ethical sphere. Even the endeavour after perfection, belonging, as it does, to the very nature of spiritual beings, is bound up with pleasure. The feeling of perfection, or rather of advance towards perfection—for we never get beyond the process—is the highest pleasure; it is the joy of attaining our own being; but reason, whose progress must always go a development of our interest in the good of others, since that is the only way in which we can become clear and truthful mirrors of the world. Self-love and love to others are quite compatible, and each is rooted in our rational constitution. Clearness of knowledge gives us an insight into our own nature, and teaches us how to set our various emotions in right and natural relations by cultivating a state of heart appropriate to our nature, and in subordinating the momentary promptings of feeling to that permanent one which is the object of his Christian self-love. This is the highest condition of this is given in our nature, which ever press towards a universal harmony; and it is the part of religion, as faith has demonstrated, to subjugate the world, to reduce the discordant elements to unity.

Schleiermacher, in his doctrine of the ancients, intensifies the inner harmony of reason and sense. Obedience to reason must be amalgamated with joy. Sensuous desire must retain its individual power; sense Addiction to the intensity of the ethical factor. Here, in fact, emotion is utilized as a means of deepening the moral law, and rendering its authority over sense, so that she can admit the feelings to a subsidiary place in the ethical life. This condition is realized in the world, and it is only by this true nobility that the truly noble critic can adjust the claims of the sensuous and the moral in such a way as to make manifest the absolute superiority of reason over sense. If he is said that, though his ethics is of an entirely rationalistic cast, he does not take up so rigid an attitude towards desire as did Kant. He insists upon the free activity of reason, and the transformation of authority into liberty, into the spontaneity of intelligence. By treating our nature as the material of duty, he is not only to set forth a preclusion of goods as the fruit of human activity, but also by bringing into prominence the creative aspect of the moral character—his power of original production—to find a place for emotion in the moral realm. Recognition of freedom and love, which, with the impulse of reason, furnishes a motive for conduct. Although we may not have the last word, yet the complex of impulse and feeling in our nature forms the 'material of duty.' In point of fact, Nature herself has made this reasonable creature a moral being; thus the distinction of soul is the necessary antecedent of the family, and the hereditary responsibility of the parent and the child is the postulate of social and intellectual education. Fichte does justice to individuality and its aspirations by his demand that everyone should take up his peculiar ethical call with the insight of genius, and choose his profession freely; as also by tracing congenial love, especially on the woman's side, to an act of willing surrender.

Herbart, too, unites emotion and reason. To begin with, he deduces five ethical ideas from our judgments of pleasure or displeasure regarding relations of will. These five are inner freedom, perfection, benevolence, justice, and equity. He does not regard these relations of will as being even qualitatively free from emotion. But in the same way the ideas which are connected with the relations of individual will, are the only harmonious 'systems' of the society; for example, the administrative system corresponds to the social system of city. Hence the highest possible development of every capacity; and spiritualized society—as presenting a great harmonious whole in which the individual systems are articulated in perfect unity—to inner freedom. If Herbart formulated his philosophy with Kant, an idealism of goods which has in view the highest good of each and all in its harmonious embodiment. If he thus gives prominence to the aesthetic view, he is also not to be understood that other pleasurable feelings may not be enjoyed in the spiritualized society. He is not so far from the Scoto-Holm theorists as to deny that, however, he is at present unable to show how the psychological mechanism may be utilized in the service of these ideas, namely, by so utilizing all educational resources in their favor as to develop the teleological tendencies to express the diagnostic ideas into habits—feelings or motives—and permanently to maintain the same.

1 Herbart's five ideas are connected with Whewell's 'five axioms.'
and thus arises the problem of how to harmonize, by a process of moral development, the whole natural endowment of impulse and feeling with reason. According to Hegel, one must maintain that ethics must lay down the base- lines of the philosophy of history; but it was pre-eminently Hegel who gave currency to the idea of development. Schleiermacher, maintaining that ethics must lay down the base- lines of the process of history as the evolution of reason. Though he gave, it is true, an intellectual interpretation of Nature, regarding it merely as a stadium of the Idea (a view which, of course, does not concern us here), he nevertheless distinguishes between Nature and Spirit in concrete, and sees the consummation of ethics neither in a natural ENDOSMOSIS nor in the Kantian Rationalism, but in **Sittlichkeit**, "established observance," in which the antithesis between Nature and Spirit is reconciled, i.e. raised to a higher unity. If, according to Hegel, reason realizes itself in the State, yet he does not regard civic life as incompatible with the community of feeling, i.e. marriage; or with the community of interests and its complex of needs; or with the community of citizenship, or, in fact, with any particular relationship of the individual life; that is, as he proceeds, he finds a place for all of these, just as he finds the characteristic feature of the Christian period in the fact that it gives due recognition to the interests and peculiarities of the individual and his desire for happiness. The course of history shows us that the tendency to combine the rational and the emotional aspects of morality is constantly gaining ground.

II. **ANALYSIS AND EXPOSITION.**—It remains to consider the nature of the emotions and their varieties, as a step towards inquiring how we are to estimate them ethically and to utilize them in practice.

1. Nature and structure of the emotions.—What are the emotions? It is safe to say, for one thing, that they belong not to the theoretical but to the practical, side of our psychical life; not to thought or imagination, but to feeling and volition. In what respects, then, do they differ from feelings and volitions, seeing that they are not identical with either, but other forms of connecting link between them? The emotions often arise as immediate reactions upon particular feelings. But such immediate and instantaneous reactions may, by dint of repetition, supernormalize a permanent condition. Another, a transitory state, but there is also an irascible disposition, i.e. a propensity to react in an angry way. Accordingly, the manner in which the subject reacts upon his feelings will be determined by his peculiar nature, his temperament, or his peculiar blend of temperaments, by character, sex, etc.—in a word, by his individuality, which, again, is modified by his family, national, or racial type. Moreover, this individual disposition is by no means limited to one's natural constitution; it may be acquired—-a fact that underlies the plasticity of the emotions. But, while the emotions are thus reactions upon feelings, we must forget that there are also moods of feeling, involving a permanent tendency towards certain forms of action; and these moods must likewise be reckoned amongst the emotions.

The emotions have often been called passions, and traced back to 'suffering' (passio); here, again, we must bear in mind that such suffering is not always a pain; and, accordingly, we find Schleiermacher maintaining that there may be such an object as last beyond the period of direct stimuli. Here the influence is really that of the **representation** of the object; and in this case the imagination works towards the expansion and intensification of the emotion; and, indeed, may become so habituated to represent certain objects as to produce habit. Schleiermacher again, by being fused together with the feelings that evoke them and the volitions that issue from them, may act as a permanent stimulus to the emotions.

The emotions have also been identified with the impulses; but impulse is really a mode of the will, and may either spring from the nature common to man or be the resultant of a long series of volitions, which, gathering strength and absorbing many hereditary transmission, may become established in the later generation. Thus, for instance, the desire of fame and of power, in their nobler forms at least, seems to presuppose a social life of some permanence, and a certain degree of culture. Impulse as such, however, is not emotion; rather it becomes emotion only when the object to which it is directed affects the feeling, and prompts the will to act. This is what takes place in particular instances; but, as has been said, the object may be so persistently presented to the mind as to give a sustained tone to the feelings, which, again, gives a definite bias to the will. The emotions, therefore, are the result of instantaneous impulses by the fact that they are traceable to some impression, or feeling, and emerge as a tendency to react upon this stimulus. We may say, therefore, that emotions are combinations of feeling with movements or acts of will, and that they may have either a transitory or a lasting character, according as they are immediate reactions upon a definite object, or upon habitual states of the soul which rest upon a more or less persistent combination of feeling and volition; these, in turn, depending upon the object affecting the soul. Moreover, it goes without saying that these habitual states may find vent in momentary outbursts.

Then we must also distinguish between the momentary strength of an emotion and its durability. An emotion may be strong for the moment, but have no persistence, as, e.g., when it is evoked by a merely passing stimulus from the object; and, conversely, an emotion may never manifest anything like intensity, and may yet work all the more powerfully; compare, for instance, an angry outbreak with cool, calculated hate.

2. Varieties of emotion.—The emotions exhibit a multitude of variations, quite apart from the distinction between transience and permanence. Thus, the feeling and its accompanying tendency to react may, as called forth by the object, be one of pleasure or of pain. If pleasurable, the motive will be one of sympathy with the object; if painful, one of antipathy. Then the emotions may be classified with reference to time—according as they are related to the past, the present, or the future. In connexion with the past, pain produces repentance, while pleasure brings satisfaction, with a wish for renewal of the conditions; and either of these, again, may be transitory or enduring. Pleasure in regard to the present is the desire; while pain arouses aversion, or, in a more intense form, anger. Pleasure in regard to the future becomes hope, with the inclination to make the thing hoped for a reality; pain in relation to the future becomes fear, with the inclination to obviate or ward off the thing feared. Obviously these emotions may also vary in intensity, i.e. they are susceptible of different degrees. But these quantitative differences must not be confounded with differences which depend upon whether a man is by the bent of his mind stronger in feeling than in will-power, or vice versa. Should feeling predominate, then, e.g., repentance will be...
not so much a motive prompting a change of will for the better, as a sentiment of regret, which, as it inhibits the will, has an enfeebling effect; similarly, contentment will degenerate into luxurious remembrance, instead of inciting the will to hold fast by what the past has given. If volition, however, be the stronger, the reverse will be the case. Moreover, pleasure and pain may, so far as their influence on the will is concerned, become quite neutral, and less dependent upon the different desire which then becomes present, and aversion hate. Again, all these modifications of emotion may be further differentiated by reference to the kind of object that excites them. Thus, feeling in passing over to volition will always be initially a feeling of self, a feeling of excitement; but this feeling of self may be of very different kinds. In the first place, one may be affected either in body or in soul. But the bodily frame itself has different aspects: there is the need, for instance, of self-preservation, or of preserving one's peculiar type. Should it be affected by a corresponding body, a fresh group of emotions plays itself off with food and sex. When reflexion has been sufficiently developed to raise a man above mere momentary sensations, he will desire permanently satisfying external impulses, and become love, and hunger will be transformed into the desire for possessions sufficient to satisfy permanently his bodily needs. The latter emotion may likewise vary as one wishes to use, to preserve, or to augment one's property. Prodigality, niggardliness, and avarice have their source here; but also liberality, thrift, and diligence. It is personal differences alone which prompt one man to liberality or prodigality, another to thrift or niggardliness, and a third to avarice or diligence.

Again, the affective state of the mind has to do with its relations to other minds. The fundamental fact is that the mind is influenced by others in such a way as to experience pleasure or pain, and thus arises sympathy or antipathy. Sympathy and antipathy also involve the feeling of self, springing respectively from the sense of being attracted or repelled by others, according as the impressiveness which is received upon the will is in a pleasurable or a painful manner. Here, also, of course, individuality counts for much. Further, we must take into consideration whether sympathy or antipathy in regard to another is aroused by his personality as a whole or only by certain aspects thereof—some being attractive, others repellant; in the latter case we have an unstable emotion, one vacillating between sympathy and antipathy. Once more, from the sympathetic emotion, so far, at least, as it rests upon the consciousness of others' equality with ourselves, springs the desire to recompense. Should another afford us pleasure, we incline to return the favour; this is gratitude. But should he pain us by doing us a disadvantage, the result is the feeling of revenge. A further principle of division might be found in the fact that care our sympathy and antipathy relate to individuals or to communities.

Finally, a man's sympathy or antipathy may either be such that his thoughts dwell most upon his own pleasure or pain; or such that the feeling for others predominates in his mind. In the former instance, he will be sympathetically moved towards another only in so far as the experience is absolutely free of pain, and, in fact, when the sympathy itself affords pleasure. In the second case, he is so much at one with the other as to enter into his feelings. The former kind of sympathy goes no further than a man's own advantage, changing even to antipathy when that disappears. He really seeks his own advancement in his recog-
ever, has meanwhile been done, unconsciously, by our psychological mechanism. The result is called emotion, though, in fact, what we so designate is only a fingerpost pointing to the greatest possible advantage. But this theory, according to which the choice amongst our emotions is really made for us by our experience—the understanding of which is fixed by the facts—is founded upon error. For, if the psychological mechanism establishes a certain hierarchy among the emotions by natural selection, we are not really transcending it; it determines the emotions by the facts. For, even if the egoistic emotion is overpowered by the altruistic, it is simply because, as a matter of experience, the former fares all the better thereby. In reality, therefore, it is not so overpowered; on the contrary, the psychological mechanism is actually guided by it. Along this line, therefore, no genuine adjustment can ever be arrived at. The truth is, moral life begins only when the understanding forms universal laws, when the difference between the ideal, the ought, the law, on the one hand, and, on the other, the actual condition of things is first realized; they then form the craving of our nature for unity, which the adjustment made by our psychological mechanism cannot satisfy. Such adjustment, in fact, will always be impossible, and one and anon break out in spite of all our altruism. The desire for unity, however, spontaneously presses towards harmony and activity; while, on the contrary, the emotions are unstable, and, being understood by ourselves, have no true spontaneity, and always end in mere enjoyment, mere passivity.

Hence we need not wonder that the naturalistic theory has been challenged again and again by a rigid and one-sided rationalism, which will countenance no rule in the moral realm except that of reason alone, and spurns the emotions as something irrational. But this standpoint is shown by history to be untenable. The Stoics were compelled to abandon the rigorism of their apathy, and to concede that in some degree even the wise man feels pain—though he does not allow himself to be mastered by it—and that he too may have 'sera and saepe,' such as good-will and joy. Further, the Stoics doubted whether the life of the wise man were necessarily possible, and spoke of an 'approximation' rather than a harmonious condition. Man should be immune from diseases of the spirit, but not free from emotion. Spinoza also, while discarding the emotions, was unable to regard them as other than a necessary product of the natura naturata; and Kant came at length to the conclusion that the propensities are not evil in themselves, but as in the sphere of the beautiful and the sublime he recognizes a certain mutual relationship between the sensuous and the spiritual.

If the moral reason, then, cannot be merely the inductive reading of our psychological mechanism on the emotional side, and if it does not necessarily involve a rigid exclusion of the emotions, or, in other words, if we can neither identify it with the formulated results of our psychological mechanism nor concede a dualism between it and emotion, the only course open to us is to grant an independent, co-ordinate position to both reason and emotion—with the proviso, however, that reason be always credited with the power of harmonizing emotion for its own ends. As we have seen, this view is held by a large number of modern thinkers. They regard the emotions as the data and material which reason has to elaborate. If the emotion arises from the movement of the will combined with feeling and prompted by an object, it is the function of reason to examine and regulate the process.

The question as to the moral character of the emotions is, therefore, to be answered generally by asserting that in themselves they are neither good nor evil, but become so only as they respectively subserve or are subordinated to the supervision and guidance of reason. This holds good of all kinds of emotion. Reason must assign the limit of their momentary intensity, and likewise regulate their duration and persistence, for it tolerates the continuance of such kinds only as coincides with its own fundamental aims. Emotions of pleasure are no more proscribed as such than those of pain. What is done of moment is, on the one hand, to determine their measure, and, on the other, to take account of their object. Anger, for example, as excited will, is not to be summarily condemned; only it must be made subservient to reason, and be directed against that which is truly reprehensible. Again, neither the impulse of self-preservation nor that of sympathy is per se blameworthy; they require only to have their respective scope and their mutual relations determined by reason. Under certain conditions the emotions will not become demoralized. Love of power rests upon an exaggerated, but in itself perfectly innocent, desire for influence; envy, again, being the result of the impulsive impulse to the in itself quite legitimate impulse of self-preservation— all sympathy being crushed by the selfish wish to possess what is another's. Similarly, the organic emotions have their rightful place, requiring only that adjustment which reason must make in view of organic needs; they must be brought into proper relations with one another and with the spiritual emotions. The emotion attaching to property, as regards both its preservation and its use, must be reduced—in conformity with the function which reason assigns to property in the moral sphere—to its due proportions in the desire to earn.

In short, the emotions as such are not evil when subject to the guidance of reason, but, just as human nature must be brought into harmony with reason, so must they be made to minister to the ends of reason. If left to themselves, they tend to degenerate, since they cannot then be kept within due measure, or be fully harmonized with one another.

4. Rational control of the emotions.—Finally, if it be asked how reason acquires dominion over the emotions, we look first of all to its power of framing ideals. Its task, alike as regards the guidance of the several emotions— with due allowance for their individual modifications—and as regards their mutual relations, must be clearly defined in the light of actual, concrete ethical ideals. It is obvious that a proper comprehension of the meaning and value of emotion in moral life is the necessary condition of right conduct. Such comprehension, however, does not guarantee its being realized in practice. It is often asserted that emotion is modified only by emotion, that reason without emotion remains a dead letter; and this is certainly the ease. The dictates of reason, therefore, must be combined with love, which we may call the positive mode of emotion; then will reason become effective. The ideal must become the object of love; then will this supreme affection—enthusiasm for the ideal—work its effect upon the other forms. Such enthusiasm cannot, of course, be manufactured, but is something free—the unforced persistent glow of love for perfection, the practical interest in the ideal of reason.

To generate this archetypal affection is the business of education, which, however, would be all in
vain unless human nature provided something for it to work upon. But reason and its ideal are not alien to man. It is not isolated from him to fail and behelds. So long as he refuses to identify himself with this consummate affection— with his own ideal—he feels an inner discord. Education may provide passion, but it cannot furnish, still less force it. If we appeal to such motives as fear of punishment or hope of reward, we may succeed in curbing certain emotions, and even in partially establishing a balance between them. But in others, and thus prepare the way for real moral conduct by removing obstacles to the attainment of the good will; but enthusiasm for the ideal is not to be acquired in this way; for, if we confine ourselves to such motives, we have not passed beyond selfishness after all. The ideal must be loved for its own sake. This supreme affectation is engendered only through the individual’s own act, for which education provides but the subject matter; and the ardent love to the Divine, enthusiasm for the good is absolutely free. Ought we, then, to call it an emotion at all, since emotion always springs from something? We feel turned motives into a motive? We must remember, however, that such an impression has a place even in the affection we speak of. For one thing, the educator may hold up the example of those who, possessed by this enthusiasm, are capable of moving our hearts. For another, while we recognize the ideal as our own, yet it always towers above our actual attainment, as if to impress us with love for our better part. Finally, the ideal comes to us in the impressions wrought by God within the soul. The mental impression in question, therefore, results, not from any external object, but from our being apprehended by our reason’s own ideal or by the Divine spirit within us. The same thing lies at the root of what is called moral passion, though this is likewise a free motive to action. Without moral passion the moral ideal cannot be realized. But it is far from adequate in itself. When the emotions, excited by the various experiences of life, are asserting themselves in their full strength, to attempt to oppose them by moral passion alone is futile. But enthusiasm for the moral ideal has undoubtedly a restraining effect upon the urgency of emotion; and, this being so, such restraint makes it possible for reflexion to intervene before the response to stimulus takes place. For this reason, which both end to be attained and apprehends the actual conditions, can assign the measure and the course of the emotion, and, taking advantage of the congenial enthusiasm for the ideal, can carry its purposes into effect. But even something more than this is required in the task of controlling the emotions, namely, a certain psycho-physical habituation. With these resources, then, it is possible for reason to subject impulse to its own ideal, or, in other words, to attain, by habit, ever nearer to a complete harmony of the emotions amongst themselves and to the right proportion of each, and so to utilize them in practice to give them the place which, in the light of the moral ideal, is rightly theirs.

We note, in closing, the recent spread of a romanticism which would base morality upon the instincts, and declares war upon intellectual interpretation; which yields the ascendancy to spontaneous feeling, and would exclude all ratio in favor of the Unconscious that is revealed in emotion—a new form of ethical and aesthetic naturalism. Such a theory, however, cannot possibly discover the proper measure of the emotions, as it really keeps the moral reason out of its rights. See also FEELING, MIND.

EMPEDOCLES

A. DÖRNER.

EMPEDOCLES was a Sicilian philosopher who was famous also as a statesman, poet, orator, physician, and wonder-worker.

1. Life and Writings.—Empedocles belonged to a wealthy and distinguished family of Agrigentum (the Greek Akragas). His grandfather, also called Empedocles (2), was a cavalry officer at Olympia in 496 B.C. The philosopher himself took an active part in the troublous politics of his native city, after the expulsion of its tyrants (Diog. Laert. viii. 63-67; Mus.), and in 492 B.C. he refused an offer of royal power; yet we read that in later years his enemies caused this champion of the people to be banished. There is much that is marvellous, much that is vague and contradictory, in the accounts of his life which have come down to us, principally in Diog. Laert. viii. ch. 2. The Sicilian historian Timaeus, who lived in the 3rd cent. B.C., and preserved many such notices, did not know for certain the place or the manner of his death. Even his date is not exactly determined.

Aristotle (Met. i. 3. 984a, 11) speaks of him as a younger contemporary of Anaxagoras (g. 20); Gorgias is said to have been his pupil (Diog. Laert. viii. 68; Quint. iii. 1). Apollodorus fixed his birth in 484; and his death, at the age of 60, in 424. But Zeller (Pre-Socratic Phil. ii. 117 ff.) has adduced grounds for placing his birth from eight to ten years earlier, i.e. in 492 or 494.

The chief works of Empedocles were two poems with the titles φύσην γὰρ τῆς φύσεως καὶ τὰ ἀναλόγα. The former, dealing with physical science, was in two books, and with Diels, we prefer the reading βιοτητικὸς in Suidas s. a. v., although Tzetzes (Chil. vii. 562) erroneously makes them three. Of these poems we have fragments extending to 440 lines.

Aristotle, who took them as a naked confession of faith, used full credit for Homer's inspiration and forcible diction (Diog. Laert. viii. 57), nevertheless took him for his illustration when maintaining, in the Poetics (i. 1447A, 17), that metaphor does not convert prose into poetry. Empedocles was the last to use verse as the vehicle of philosophic exposition; and Anaxagoras reverted to prose, with which the Milesians had started.

2. The Four Elements.—In his dialectical theories Empedocles was an eclectic. Like Leucippus, he had studied the Eleatic philosophers; but he rejected their chief doctrine, that of the One, and reverted to plurality to give them the place which, in the light of the moral ideal, is rightly theirs.

We note, in closing, the recent spread of a romanticism which would base morality upon the instincts, and declares war upon intellectual interpretation; which yields the ascendancy to spontaneous feeling, and would exclude all ratio in favor of the Unconscious that is revealed in emotion—a new form of ethical and aesthetic naturalism. Such a theory, however, cannot possibly discover the proper measure of the emotions, as it really keeps the moral reason out of its rights. See also FEELING, MIND.
EMPEDOCLES

—consist severally of air, earth, fire, and water united in determinate proportions.

has survived which was not adapted to its environment. Empedocles's scientific imagination may also be seen in his mechanical theory of respiration, on the analogy of the water-clock (Diels, 21 B, 109 [-190]), and of the spinal vertebrae (Ar. de Part. Anim. i. 1. 640a, 16); but more particularly in a theory of sense-perception based upon the entrance, through symmetrical passages or pores (φτόεοι), of films (ἀρδόνεοι) emanating from external objects, and dissolving in the film of sensation best suits taste and smell; it may have been, as Diels thinks, derived from Leucippus; the application to vision (though adopted in great part by Plato) is beset with difficulties. The unique fact of perception proper Empedocles sought to explain by means of another principle, that like moves towards, and is recognized by, like. The sentient subject knows earth, water, air, and fire because these elemental substances are found in his own composition. This principle must be carefully distinguished from the attraction of like to unlike personified in φαλος, or Love. Love is the union of two opposite elements; and consequently it is impossible that they are what he elsewhere calls the demons. (Diels, ii. 3. 427a, 26); there is no such gulf as Parmenides presumed between sense and reason. The value of the senses as sources of knowledge is implied throughout the poems, and the passage (Diels, 21 B, 174) which mentions the sun, moon, and stars, indicates the opinion of Zeller, would concede superior claims to reason has been set right by Stein's punctuation.

5. Religion and Ethics.—In the cosmos as here set forth there was nowhere to be no place for religion; yet Empedocles speaks of gods. (1) There are the 'long-lived gods, greatest in honour,' who are products of the mingling of his four elements, and, as such, are set down side by side with 'trees and men and women, beasts and birds, and fishes bred in the waters' (Diels, 21 B, 21 [i. 180]). These, be it remarked, are not deathless, but merely long-lived; it is impossible that they are what he elsewhere calls the demons. (2) As already noted, he also defines the four elements and the two efficient causes. (3) Further, we find the sphere spoken of as a 'blessed god,' but this again may be merely a poetic description. It need not imply monotheism, any more than the parallel expressions of the pantheist Xenophanes.

In his other poem, the Purifications (Καθάρσιος), Empedocles poses as a moral teacher and religious reformer. He has first serenely depicted the inspired votary of Apollo; he lays claim to a Divine origin and superhuman powers. He recounts his successive transmigrations. The tone of the whole poem is mystic, as opposed to the scientific spirit of the περὶ διανόησιν, and bears many resemblances to Orphic and Pythagorean doctrines. There is one passage where a god is described in terms perhaps borrowed from Xenophanes: He is not provided with a human head upon his limbs; two branches do not spring from his shoulders; he has no feet, no swift knees, no hairy members; he is only a sacred and immovable mind shooting with swift thoughts through all the world! It would seem, therefore, more reasonable to follow Zeller and Diels, who think that Apollo is meant; for from an early date, as J. Adam remarks (Religious Teachers of Greece, Edinburgh, 1825, p. 249), 'Greek religions thought naturally tends to spiritualize Apollo.' Empedocles also tells us of demons, who, 'having polluted their hands with blood,' are condemned to wander for three ten thousand seasons in all manner of mortal forms through the universe until
EMPIRICISM

their sin is expiated; and one of these, he says, 'I now am, an exile and a wanderer from the gods' (Diels, 21 D, 115 [i. 267]). Here is the doctrine of revelation for guilt, and here, too, that of metempsychosis.

The moral teaching of the Kallipolos consists mainly of tabus based upon the belief in transmigration and the kinship of all animate and inanimate things. Empedocles describes a period when men lived at peace with each other and all the world, and bids his followers abstain from all animal food, and from beans and laurel-leaves.

It is an interesting, though perhaps insoluble, problem to determine how the Purifications is related to the poem upon Nature. Are we to suppose, with Burnet (Early Greeks, p. 207), that the Kallipolos was the work of his youth, and the xepi 2n6cr3o\ the fruit of riper study in mature life? That the same thinker should at the same time have endorsed the apparently contradictory doctrines of both poems is advocated by Burnet (ib). Such a view is possible only to those who recognize in Empedocles not so much a philosophic mind as an enthusiastic poet and orator, careless of logical consistency.

R. D. HICKS.

EMPIRICISM.—Empiricism denotes primarily the scientific investigation of the world which we experience through our senses. In the world so experienced we are continually apprehending uniformities of different kinds; scientific empiricism brings together groups of these uniformities apprehended as exhibiting the same uniformities, and endeavours, by further observation and experiment, to apprehend more clearly the special nature of the uniformities within each group, and the precise conditions on which their presence depends.

Thus, to study the nature of two-dimensional space, we bring together figures in two dimensions, and by the process of reasoning obtain figures in which we apprehend more directly the nature of the triangle, the circle, etc., and from the mutual relations of their parts in definite figures apprehended as necessary certain further conclusions with regard to the nature of these figures. In all cases it is through the construction that we come to apprehend the nature of the figure, we apprehend, e.g., the universal truth 'Things which are equal to the same are equal to one another' only by considering a particular instance. But in some cases the construction is more elaborate; e.g., in Euclid i. 47 the figure is extremely complex, and presupposes constructions completely out of the triangle; and therefore, therefore, aims at re-grooping the phenomena studied, according to their uniformities, in continuous series, beginning with the relatively simple and passing to the progressively complex.

Progress in Mathematics and the other empirical sciences depends on finding the right 'construction,' in discovering a method which will enable us to apprehend and therefore definitely the elementary parts are connected in any given case.

What is aimed at is precise formulation such as, e.g., the exact reciprocal relation between the sides and angles of the triangle, and the present state of all the sciences this exact formulation is rare, and it is only by the examination of fresh groups of problems that we are enabled gradually to reform our present inexact formulations.

By proceeding, then, in these two ways: (1) by continually attacking fresh problems, and (2) by perpetually revising the stock of acquired formulations, Empiricism hopes to obtain an ever wider and deeper knowledge of the world which we come to experience through our senses; it admits that the uniformities hitherto studied have rarely been appreciated in full, and that their 'laws' are only relatively true; but it hopes to advance, within this sphere of relative truth, to laws which ever more adequately express the nature of the reality which it studies.

In one direction the ideal of ever-improving, but ever-relative, knowledge is definitely limited. There is one main presupposition of Empiricism which, as such, it cannot question or even examine, but must simply accept. This presupposition is expressed, on the objective side, as the 'Law of the Uniformity of Nature'; this means that the apprehensible world, as such, has a definite nature of its own, and works according to laws which remain universally valid, though they are partially apprehended by us, through unstable sense-organisms and at particular moments of time; the stars continue to revolve in definite orbits through all the advances of science, from Aristotle to Copernicus, from Copernicus to the present day; the stream pours forth its waters into the sea, the sea still dashes upon its rocky strand, though every living eye is closed in slumber.

From the side of the subject, this presupposition is expressed by saying that the mind is a tabula rasa, a waxen tablet upon which the external world imprints its forms. Its case is perspectiva; more than that we cannot say. There can be no scientific 'theory of knowledge'; for Empiricism maintains that our apprehensions appear to contain uniformities only because they are apprehensions of objectively uniformities.

Necessities of Apprehension—causation, substance, etc.—are so only because they are apprehensions of necessities in the Object; that the 'Laws of Thought' are laws for thought only because they are laws of the things which thought apprehends. In short, the uniformities and necessities belong wholly to the apprehended Object; on the side of the Subject we have simply apprehensions—apprehensions of just those objective uniformities and necessities.

The main principle of Empiricism being, then, that through sense-experience we come to apprehend the universal laws which express the nature of the apprehensible world, it follows that the existence of false thinking, is impossible. We may fail to apprehend; we cannot misapprehend. Where we have not yet found the right construction, the right method for observing the apprehension is to proceed from the apprehension to the construction, and so fail to apprehend its full nature. But, when we say, e.g., '2+2=5,' the possibility of self-correction shows that we did not really think so, that we do not apprehend a real equality, and so failed to apprehend. When we attend and have the features of the problem clearly before us, we cannot fail to apprehend the correct conclusion. In fact, error is always due to some sort of inattention, e.g., to
psychological causes, against which scientific Empiricism has its special safeguards. A few words of the kind might be here discovered in the

right construction, the method which enables us to apprehend clearly the connexion of the elements within the given problem; the statement of the conclusion so apprehended is said to be 'true.' In this sense, and in this sense only, much of the scientific method is, by the adherents of its principles, held to be 'provisionally true.' If a few advanced scientists confirm each other's observations, but the aim of science is always to prove its results in such a form that the observations can be verified by any intelligent student. This aim is most clearly attained in the text-books of Mathematics and Physics. A statement, then, is true when we find the right construction and observe its truth directly. It follows that the claims of the 'Law of Contradiction' or of the 'Principle of the Inconceivability of the Opposite' to present us with a 'formal criterion of truth' are inadmissible. These so-called 'criteria' are, in fact, virtual re-statements of the general principle of Empiricism, viz. that the apprehensible world has certain definite characteristics: but truth consists in the apprehension of these characteristics, and not of just these particular definite characteristics. Consequently, in order to apply to particular cases, the 'criteria' have to become particularized, in which process the so-called 'truth' is lost, but as many criteria as there are problems to which they are to be applied. Moreover, Empiricism insists that a particular statement is not true because its opposite is inconceivable, but that its opposite is inconceivable because the statement is true. There can thus be no formal criterion of truth, and progress in knowledge depends always on our possessing insight into the particular nature of particular scientific problems.

Owing to a number of historical causes, these main outlines of Empiricism have been seriously misunderstood by Empiricists themselves, as well as by their opponents. Hume's separation of the particular sense-experience from the universality and necessity apprehended through that experience makes these appear mere fictions of our imagination; a too mechanical adherence to the tabula rasa manner has misled many into supposing that they can apply physical laws to the explanation of apprehension itself; and J. S. Mill attempted to prove empirically the presupposition of Empiricism itself, viz. the possibility of defining and similar vagaries in the writings of the Empirical School are to be regarded as aberrations from the simple tenets of scientific Empiricism.

LOCKE, MILL, IDEALISM, PHILOSOPHY, and the Literature cited under them. R. C. LODGE.

EMPLOYERS.—The term 'employers' is a relative term; it connotes employees and a relation of contract between the two parties; corresponding terms in common use are 'masters' and 'men,' 'capitalists' and 'labourers,' though the latter are not now exact equivalents. The fundamental facts from which the relation springs are that one set provides work and pays for it, the other performs the work and receives payment. The classification is a result of an economic division of labour according to function in the operations of wealth-production or conduct of business; and it gives rise to a parallel distribution or division of the proceeds of such labours. To be more precise, the function of the employer is to find out the work to be done, to plan, to organize, and direct it; he takes the risk contingent upon its performance, and on this account is often called the 'entrepreneur' or undertaker; he becomes a kind of middleman or go-between in the equalization of demand and supply—the demand being that of the consumer for goods, and the supply that of the existing kind of labor. The employer seeks to satisfy that demand. The employer is thus an essential factor in the refined and intricate system of modern industry.

In earlier times, and under simpler conditions of life, when the market was quite local and small, the employer provided the capital for the undertaking; under modern conditions, with wide markets and large production, he very frequently conducts the enterprise with the aid of borrowed capital. The facilities afforded by a widely diffused system of banking and a highly organized money market, together with the method of combining many different capitals on the joint-stock principle of enterprise, have enabled large amounts of capital to be placed under the direction of men who have special ability for controlling it for purposes of business. Under such circumstances the employer becomes mainly the manager of capital or the agent of its owners; he is entrusted with its command because he possesses in a peculiar degree the special faculty of business management, together with technical knowledge about the business in which the capital is embarked. The separation of the functions of capitalist and employer is the outcome of an economic evolution, a case in which has progressed from a division into the methods of production and exchange. It has proved a highly efficient form of differentiation, firstly in securing the direction of affairs by specialists, and secondly by utilizing the other's capital on which neither is boarded and would therefore be idle, or which indeed might not have been saved at all, did not such openings for its employment arise.

The function of the employer has become so important in modern industry that he is often regarded as a fourth factor in production; land, labour, and capital being the three factors formerly recognized as the requisites of wealth-production. The huge scale on which manufactures, commerce, and transport are now organized has created a demand for great financial and technical skill, and as a consequence single individuals of exceptional talent now control a vast number of financial interests and determine the employment of multitudes of labourers. On their good management depend the success of the venture, the return to the savings invested in it, and the increase of profit. Thus these employers receive very high remuneration, and many of them, from their superior ability, derive a surplus profit of a kind which has some of the chief economic characteristics of rent.

Many important problems arise out of the relations of employer and employed. In the Middle Ages the apprentice to a craft duly became a journeyman, and in course of time generally evolved into a master on a small scale; that is, he became an independent producer and an employer of other apprentices and journeymen. Under modern conditions only a small percentage of workmen can ever become employers, and, indeed, the employer class tends to be confined to specially trained men drawn from those ranks which enjoy unique opportunities for acquiring the wide and varied knowledge and experience which are requisite for successful organization. The employees constitute a large and distinctive class, whose mode of work is determined, to a great extent, by the kind of middlemen or go-between in the equalization of demand and supply—a demand that of the consumer for goods, and the supply that of the existing kind of labor. The employer seeks to satisfy that demand. The employer is thus an essential factor in the refined and intricate system of modern industry.
the conditions which affect their safety, comfort, and health, and determine the hours of labour in their several industries. Trade Unions obtained legal recognition only in 1825; they have advanced gradually in power and influence, and are now a very powerful instrument in determining the economic conditions of industry. Their evolution has been attended with many struggles and disastrous strikes, which have at times paralyzed the activities of industrial and kindred pursuits, and caused great economic loss. They are, however, now a recognized and important institution in the negotiations between employers and employees.

The perfect operation of capital and labour in production is a matter of universal interest, since it depends on the supply of wealth. It is to the advantage of both capital and labour that each should be highly efficient; divergence of interests arises in the division of the proceeds, and it is in the determination of the shares that the conflicts of capital and labour arise. At the period of the Industrial Revolution, and for a long time after the introduction of machinery and power into industry, the exploitation of labour by capital worked very unjustly for the employee. Trade Unions introduced a new principle in collective bargaining, and strengthened labour in its attempt to advance the position of labour, and have enabled the employees in organized industries to compete on equal terms with the employer. At the bottom of the scale of workers there is still a class whose wages are abnormally low and whose industry is often described as wasted. Their condition is due to the low efficiency of their labour, the extreme ignorance and weakness of the employees themselves, and their inability to organize and combine. Social investigation has been active in exposing the circumstances of these labourers, and legislative action has been adopted for amending their position. This is, however, a problem which cannot be considered here.

The economic laws have been devised to diminish the friction between employers and employed, and to provide means for fair distribution of the product. The system of co-operation (q.v.) originated in an area of industry, and in the control of capital, and to combine the interests of employer and employed in the same set of individuals, the labourers themselves providing the capital for their own employment. The weak point, however, resides in the difficulty of management. Experience has shown that no large industry can be successfully conducted without the guidance and direction of highly qualified managers. The kind of ability which they possess is relatively scarce and always commands a high price. Thus, though co-operation does in some respects entail the functions of the employer, it does not dispense with his services; a price has to be paid for efficient management, and to the manager must be entrusted authority and discretion. Thus the employer as organizer becomes inevitable in co-operation of any kind, but most of all in productive industry where the community has to compete in the open market with the produce of rival firms.

The profit-sharing system is another method for reconciling the conflicting interests of intelligent workers and employers. It is evidently for higher efficiency by a combination of good feeling with an assurance of fuller reward, yet it is dependent upon the excellence of management and the skill and ability of the employer. No better instance of the working of this system of production can be adduced than the case of the South Metropolitan Gas Company, so admirably conducted for many years by Sir George Livesey.

Socialism, again, seeks to replace private enterprise by State ownership and control for competition the principle of public control of capital and the means of production; it also encounters the same economic necessity for skilled management. The employer may be theoretically neutral, though actually suffering and dependent for its success upon the organizing skill of individuals, and the problem of efficient management will become very serious if the position, direction, and control of State employees becomes dependent upon political influence or a bureaucracy. The equivalent of the employer must be found, and in the absence of the test of competition other avenues to the appointment of the directing staff would endanger the economic success of the proceedings. All organization involves grading, and officers are as essential to an industrial army as to a military force. Work must be organized; some persons must have authority to direct and command; their class becomes virtually an employing class as regards discipline and management; and, if it does not determine absolutely the rate of wages, neither can it guarantee the degree of that reward which must ultimately determine the wages in amount.

From this brief review of the chief modes of conducting industrial enterprises, it will be obvious that the employer plays a vital part in the system of large industry, and that its success depends in a great degree upon his specialized skill. Competition for the rank of employer in business concerns which are conducted on a huge scale is exceedingly acute. The successful employer is a case of the survival of the fittest in a contest where no quarter is given. A large proportion of those who start as employers in smaller businesses fall in the struggle and disappear, their places being taken by others more able, or, in some instances, less scrupulous. The magnitude of modern industrial concerns offers to men of extraordinary business faculty great opportunities; it has also led to a grading of employers. Much of the work of direction is relegated by the chief to subordinates and heads of departments. The highest controllers of industry resemble a great general or chief engineer. In some cases this is the control of capital; but generally it depends upon the combination of many attributes—judgment, foresight, grasp of circumstances, promptitude, decision, firmness, and resourcefulness. The reward of success is proportionally high, and consists of wages plus a high rent of ability. The share of profits which recoops capital and risk will go as gross interest to the shareholders who provide the capital; the share which passes to the chief organizer is determined by his talent. This analysis reduces the employer in large production to a wage and rent receiver; he is really a worker of exceptional capacity receiving a high monopoly rate of pay from a great and distinguished barrister. Thus the conflict in sharing is not merely between labour and capital, but also between groups of employers of different degrees of ability; capital, as such, but not the returns of every kind of risk, the remainder being distributed between ordinary labourers and the special labour of organization and control—all under the play of competition. The nature of the problem of modern industry cluster round the functions of the employer and the relations they involve; their fuller analysis and discussion, however, would go much beyond the proper limits of the present article, which must cease here, with the assertion of the liveliness of the field of inquiry. See, further, art.
EMPLOYMENT

297

ECONOMICS, EMPLOYMENT, SOCIALISM, TRADE UNION.

G. ARMITAGE-SMITH.

EMPLOYMENT.—1. Connotation of the term.—'Employment' may be held to mean the exercise of any function, or the performance of any kind of service; the function in question may be exercised by a person on his own initiative and to his own advantage, or it may be exercised voluntarily or obligatorily by one person for the advantage of others or for mutual advantage. For the purposes of the present article 'employment' may be considered as the rendering of service through the exercise of a function in accordance with mutual obligations imposed, or voluntarily assumed.

2. Relation of employer and employed.—In primitive slavery there is an implied obligation of protection and of opportunity to acquire maintenance for him, in correspondence with an obligation of service imposed upon the slave. In modern serfdom there is at least a similarly implied obligation on the part of the serf-owner, in regard to the maintenance of the serf, imposed upon him by the State, when the opportunity in question has not been productive. (Thus for a long period in Russia the serf-owner was obliged by law to provide living subsistence, with grains and other articles, according to his means.) In voluntary employment of free labourers by employers, there is an implied obligation of civil treatment and facility for the rendering of the service, and there are obligations imposed upon both master and servant by customary and statutory law; and there are the explicit obligations in respect to hours of labour, remuneration, and notice of quitting, which form the subject of a written or verbal contract.

The incidents of the transition from voluntary or quasi-voluntary employment to personal bondage, and from that condition, through land bondage or serfdom, to voluntary employment, in the system of voluntary employment, have no doubt varied in different countries and according to the different periods over which the process extended. The story is too full of the most luminous details of the course of development, chiefly because the main incidents of the several stages have been comparatively recent, and because they have been indicated in a large number of formal documents. From that history it may be gathered that the dependence of the free hired labourer, arising from advances for the building of his dwelling, or for expenses during sickness or other incidents involving absence of earnings, led to a contract by which he obliged himself to work for his creditor, the wages otherwise due for his work being placed against the interest only, or against the principal of the debt and the interest together; or, alternatively, wages and loan alike being cancelled and the debtor entering formally into servitude. The immobility of the propertyless debtor was secured by police measures, and the peasant was thus tied to the soil, while the piling upon him of obligations and taxes completed his ruin. This process was in effect fully worked out in the 18th cent. and the decay of the system followed. The introduction of mechanical industry on the large scale rendered the employment of skilled labourers necessary, and although, in the early stages of Russian industrial enterprise, forced labour was largely employed by insurrection of peasants to free men. From the beginning of the 19th cent., some employment of free hired labourers in industrial establishments. The presence, in the same factory or mill, of free men and of hired labourers was uncommon, and from this and other causes the decay of servitude began. The system of factory labour was subjected, in the latter half of the 19th cent., to the competition of the so-called isolated industry of the cottage (laboral être), under which the cottage factories were manufactured for sale to the merchant who offered an immediate market for his product. The profitable operation of such a business, together with the absence of large accumulated capitals, prevented the merchant from being also employer. The exploitation of the independent and isolated craftsman was simpler and less exposed to risk than the exploitation of grouped workmen in a factory. The advent of steam power threw the economical advantages on the other side, and gradually the factory gained at the expense of the cottage. In factories to which the cottiers were not attached, wages were credited to them against their taxes, and against their obligations where these were defined; where the latter were not defined, wages were determined by the practice of paying directly to the manufacturer, or of introducing, a class of free hired labourers seeking employment, gradually emerged. The emancipation of the serfs in 1861 did not at once take away all the people in that class, but it greatly reinforced it. When this event occurred, large numbers of the peasants who on the serf-farms immediately abandoned their employment and returned to the new conditions, creating a temporary scarcity of agricultural labour and an advance of industrial wages.

The system of serfdom, with its attendant industrial ascertainment, was undoubtedly subservient of human dignity, but it involved employment for every one. Where there were few or no free labourers, and where every one was either master or servant, there could be no unemployment.

This at all events was the theory. Flights of peasants, however, occurred from estates (in Russia) when, owing to deficient harvests or mismanagement, the peasants were unable to subsist on their own earnings and their property was unwilling to support them; and these fleeing peasants were of course landless and unemployed.

The phenomenon of unemployment may be regarded as coincident with the development of free hiring. Unemployment—occasional, periodical, or permanent—may be considered as the price which is paid for the working for hire, or the obligatory labour. The conditions of employment have historically been subjected to determination—by the State, by the municipality, by the trade unions, and by the trade unions as regards hygienic conditions and protection from machinery in factories, as regards safety of mines and ships, and as regards the amount of wages either by way of fixing a minimum or a maximum wage, or, in respect to the periods and methods of payment, to the attachment of wages for debt, or to the security for their payment in case of the bankruptcy of the employer.

3. The State and employment.—The policy of the modern State with reference to factory legislation was in general opposed by the advocates of laissez-faire. In the first half of the 19th cent. The expediency of sanitary legislation for factories, etc., can no longer be looked back to a period of wanton improvident legislation, so far as the general principle is concerned, although every extension of it is necessarily subject to criticism. The expediency of the control of the wages of the hired labourer, which is made between the employer and his workpeople, is by no means so universally acknowledged, although the State does, as a rule, prevent by law the payment of wages in the form of goods (under the Truck Act) or in public-houses. It does not now prescribe the rate of wages. An argument for a national minimum has, however, been advanced by Mr. Sidney Webb (Industrial Democracy, London, 1897, ii. 760 ff.). He considers such a measure as the only means of putting an end to 'industrial parasitism,' and as a natural complement to the national hygienic minimum which he thinks has already been carried into effect in factory legislation. (see, however, Zwolinski-Schmoller, 384-385). The principle of a minimum wage for the mining industry obtained legislative sanction from the British Parliament on the occasion of the great coal strike of March 1912.

The policy of an authoritative fixation of a minimum wage is open to the criticism that such a measure would lead to the non-employment of those whose wages might be insufficient to justify the minimum payment, unless those wages were fixed at a very low point; yet such persons might be able to earn a part at least of their subsistence...
EMPLOYMENT

sistence by being permitted to work for inferior wages. Mr. Webb might answer that such cases of 'industrial parasitism' should be otherwise provided for, because their presence in the labour market tends to lower the wages of the group to which they belong. The reactions of a minimum wage would, however, be extremely difficult to forecast even if much more numerous data than now exist were available (cf. Zwiliein-Sidelenko, L.c.). The policy of fixing a minimum wage by a trade union is open to the objection that the minimum is also a maximum, and that the highly efficient workman is obliged to work at the same rate as the less efficient. Even when the wages are paid by piecework, the workman who works harder than his fellows and makes more money finds it difficult to continue to do so because of the opposition of his comrades, who conceive that his proceeding may tend to bring down the piecework rate (see, however, on the whole subject, 'The Device of the Common Rule, in Webb, op. cit. ii. 718 ff.). The policy of fixing a maximum wage by the municipal authorities is open to the objection that, unless the maximum is placed at or above the rates current in other districts to which workmen may migrate, there will be a tendency for workmen to move elsewhere. This is no objection to a maximum.

In the 15th cent. the municipal governments of some of the Italian towns fixed, in the assumed interests of the employers, a maximum of wages. Venice did this, and so, too, with the result that labourers flocked there, and wages in that city became lower than elsewhere.

4. The ethical aspect.—On its ethical side, the relation between employers and employed appears at present to be passing through important phases, although the direction of the movement is not always obvious. The principle known in Scotland as ce canny, involving the performance by the workman of as little work as possible, may not be widely or frequently, but is certainly in some industries occasionally, applied both in Europe and in America. On the other hand, remorseless exploitation of the workers probably still exists in both industrial continents and in Japan, especially with regard to unskilled or inferior skilled labour.

Apart from the possibility of improvement, from an ethical point of view, on both sides, of the relation, there is to be considered the certainty of economic deterioration which must follow in the eventual and even utter reaction towards a relation sounder alike from an economic and from an ethical point of view. The 'class conscious' working mass, which, according to the Marxist theory, eventually completely overcomes its antagonist, the 'class conscious' employing class, may carry the process to the bitter end, or the conflict of classes may be arrested by a sense of la solidarité humaine arising in both classes. Particular schemes like those of Godin and Loclaire, the movement for co-operative production, and the like, must be regarded as of less importance than the mass movement. Whether or not this movement is making for increased social, as opposed to class, consciousness, is at present extremely hard to determine. There appears, however, to be a certain general tendency in that direction—the ethical relations of the classes being probably somewhat improved by the gross increase in production, and by the consequent mitigation of the struggle for existence. A check to this increase, considered in the wages of the group to which the population, would undoubtedly involve a check to the ethical advance.

5. Concentration of capital and industry.—The role of the employer in modern industry becomes more and more important, respectively, the diversity of the group to which the population, undoubtedly depresses the wages of their groups.

bilities become greater, with the accumulation and concentration of industrial capital. The employer also becomes more impersonal. Although very large enterprises are frequently associated with this tendency, it is individual (especially in the United States), the actual share of that individual in the management of the enterprise is usually confined to the determination of some matter of wide policy, and is generally influenced by his partners. The ultimate control of all large enterprises must rest with the body of its stock-holders at a particular moment. In many large industrial concerns the number of stockholders is at least as numerous as the number of employees. Both are highly fluctuating bodies,—one body changes its personnel daily in the bourses, and the other changes daily in the workshops. The concentration of industry, which has gone far in the United States, has been accompanied by grave difficulties of management, the bold financier being rarely patient enough in respect to detail to secure the economies which have been anticipated from the concentration. The mere fact of concentration does not, however, appear to have been adverse to the interests of employees; the chief antagonism to it has arisen from the small trader, whose profits have been reduced, and the 'profit' of the large joint-stock company or group of companies combined in a merger or trust.

From a theoretical point of view, the function of the employer, as such, is to administer his business in such a way as to secure its continuity by the creation of a sufficient reserve against the accidents of trade, and to secure the goodwill of his employees in such a way as to retain an efficient working personnel. The increasingly impersonal nature of the character of employment may not improbably mitigate the class struggle, because of the diffusion of the capitalist interest, and even its transmutation into the working class itself.

In the United States and Canada, for example, the relatively high wages in some industries enable certain groups of workers to accumulate considerable sums of money. These sums are invested by them not merely in houses or in land, but also sometimes in industrial securities, probably rarely in the industries to which they themselves belong, generally rather in others.

Four important recent incidents in the evolution of employment demand mention in this place; these are: (a) the appointment of Arbitration and Conciliation Boards in the United States; (b) collective bargaining between groups of employers and groups of workmen; (c) the establishment of Labour Courts in Canada; and (d) the project of insurance against unemployment.

(a) Arbitration Boards in England probably owed their existence to the concord de prud'hommes of France and Belgium, which were organized early in the 19th century (cf. H. Crompton, p. 19 ff.). The first Board of this kind in England appears to have been formed in 1849, for the purpose of dealing with a dispute in the silk trade at Macclesfield (ib. 184); another followed in 1853 in the printing trade (ib. 131); but the most important early Arbitration Board was that formed in 1860 for the purpose of dealing with disputes in the hosier trade at Nottingham (ib. 19). The practice has been widely adopted in Great Britain, in New Zealand, and in Canada—with qualified success. In none of these countries has it altogether prevented strikes; but it has in some of the Board must, therefore, invariably involve either a compromise, in which both sides give way somewhat, or a victory for one party or the other. In
the first case, neither party is wholly satisfied; and in the second case, if one is satisfied, the other is not. This is true of all litigation; but in industrial disputes, the arbitrators are expected to conduce to peaceable settlement in a sphere in which positive law and even precedent afford no guide, which in litigation they do. The decision of the arbitrators has not, that of courts have, the force of law, because under present industrial conditions, a large body of men cannot be forced against their will to work for a particular employer for wages determined by a third party (see, however, Labour Laws and Arbitration in Lit. and New Zealand Year-Book). The history of the great strikes in England in 1911 and 1912 is significant in this connexion.

(b) Collective bargaining grew out of the practice of arbitration. It has been strenuously objected to by employers, but in most of the staple trades it has come to be recognized. It is frequently accompanied either by periodic fixation of rates of wages, or by a scale by which a sliding scale (as in the coal and iron trades).

(c) Labour Exchanges, Labour Registrars, or Labour Bureaux of a private character are of long standing in all countries, and such capital labor is by law, or by late years there has been an increasing hostility to such agencies, especially those which concern themselves chiefly with the employment of sailors. In the case of private agencies and to extend the functions of Labour Exchanges, public institutions have been established in Germany, France, Belgium, and Great Britain. In all these countries the operations of such institutions have now become extensive. (Cf. Board of Trade Reports, cited in the Lit.)

(d) Insurance against unemployment has existed, in fact, for many years in the unemployed benefit offices, the Unemployment Insurance Offices were established in Berne in 1893, in Cologne in 1896, in Leipzig in 1903, and elsewhere. (Cf. Board of Trade Reports, as above.) Insurance against unemployment was included in the National Insurance Bill (cited, cf. 5890, London, 1911). In certain trades, insurance against unemployment is, under the Insurance Act, compulsory. The total Unemployed Insurance Fund is provided partly from contributions by the working men, partly from contributions by employers, and partly from moneys voted by Parliament. The effects of the new Act will not be observable earlier than the year 1913.

6. Causes of unemployment.—The emergence of a class of free hired labourers, or of persons voluntarily seeking employment, usually makes itself manifest by the migration of numbers of such labourers to periodical or permanent centres of employment.

Instances of such periodical migrations are to be found in the movement of hop-pickers to Kent; in that of Irish harvesters from Ireland to the Lowlands of Scotland; in that of Italian coutalini from Lombardy and Piedmont to the south of France; in the annual (annually about one million) of harvest labourers from various parts of northern and central Europe to the Black and Russian regions; in the 'caravans' movements from Ontario and Quebec to the Prairie provinces of Canada; and in the annual migration, which now assumes considerable proportions, of workmen from Scotland and from Italy to America in the spring, and to Scotland and Italy in the autumn. The colonisation of America and of Australia, the partial colonisation of Africa by Europeans, and the colonisation of the Straits Settlements by Chinese, afford instances of permanent settlement of migrants.

Migration from the rural districts to the towns is a phenomenon common to all regions where no insurmountable obstacles exist against the mobility of the rural population. The weight of high wages in the towns, as compared with the scale of wages in the country, and the relatively greater attraction of social centres, in general, conduces to this movement. This process customarily do-

nudes the small towns, diminishing in them the demand for labour, and then denudes the villages. The stream of labourers seeking employment in the industrial towns is expected to conduce to peaceful settlement in a sphere in which positive law and even precedent afford no guide, which in litigation they do. The decision of the arbitrators has not, that of courts have, the force of law, because under present industrial conditions, a large body of men cannot be forced against their will to work for a particular employer for wages determined by a third party (see, however, Labour Laws and Arbitration in Lit. and New Zealand Year-Book). The history of the great strikes in England in 1911 and 1912 is significant in this connexion.

6. Causes of unemployment.—The emergence of a class of free hired labourers, or of persons voluntarily seeking employment, usually makes itself manifest by the migration of numbers of such labourers to periodical or permanent centres of employment.

Instances of such periodical migrations are to be found in the movement of hop-pickers to Kent; in that of Irish harvesters from Ireland to the Lowlands of Scotland; in that of Italian coutalini from Lombardy and Piedmont to the south of France; in the annual (annually about one million) of harvest labourers from various parts of northern and central Europe to the Black and Russian regions; in the 'caravans' movements from Ontario and Quebec to the Prairie provinces of Canada; and in the annual migration, which now assumes considerable proportions, of workmen from Scotland and from Italy to America in the spring, and to Scotland and Italy in the autumn. The colonisation of America and of Australia, the partial colonisation of Africa by Europeans, and the colonisation of the Straits Settlements by Chinese, afford instances of permanent settlement of migrants.

Migration from the rural districts to the towns is a phenomenon common to all regions where no insurmountable obstacles exist against the mobility of the rural population. The weight of high wages in the towns, as compared with the scale of wages in the country, and the relatively greater attraction of social centres, in general, conduces to this movement. This process customarily do-
Competent management may, through the creation and intelligent use of reserves, distribute labour force in such a way as to secure continuity of employment under any but long-continued abnormal conditions; whereas incompetence and want of reserves render many employers liable to sudden and serious unemployment in any season or crisis, whether the unemployment be due to ordinary fluctuations of trade or to a general slackness of demand. The former idea has led to a propaganda of collectivism in which the principal point is that a democratic State should be sole employer; and the growth of the latter has led to the idea that the expansive element in State and private employment alike should be checked by a system of social insurance which would prevent the failure of the more efficient and progressive firms.

The system of social insurance has an obvious disadvantage in that it involves an expenditure out of the national income itself. But it is being urged that the efficiency of the system is not to be judged by its supposed waste of wealth but by the value of the benefits it provides to the unemployed, and that it is the only available means of conferring a social advantage on the mass of mankind. The idea of the benefits is that they shall be given to the unemployed as a substitute for the work they would have done had they not been unemployed, and that they shall be sufficient to enable the unemployed to maintain themselves adequately during the period of their unemployment.

The scheme of social insurance must therefore be drawn up in order to avoid two evils: to prevent the funds from being wasted on the rich or the idle, and to avoid the effects of a too early ending of the unemployment benefit on the poor. The second principle is already admitted. The first principle is not merely an altruistic desire to make the payments to the unemployed as efficacious as possible, but it is also an economic desideratum. The object of national insurance is to provide a substitute for the loss of employment and to make up for the periods of unemployment. It is an attempt to provide a substitute for the market, and to distribute the population equally over the different employments which are open to them.

3. The right to work.—Such positive steps may or may not involve the recognition by the public authority of the right of the labourer to the opportunity for labour. Where such a right is recognized, and where machinery is provided for rendering it effective, it is difficult to see how the corollary of obligatory labour can be evaded. An interesting experiment in this connexion is at present in progress. An Employment Committee has been appointed in Glasgow, under the auspices of the Board of Trade. The functions of this Committee involve the examination of every young person who is likely to leave school and the provision of employment, after the manner of the Board of Guardians. Should this plan be widely adopted, it is difficult to avoid the conclusion that the result will be to replace the voluntary competitions of the labour market by a system of compulsory employment for which there is no parallel in any other country, and which is likely to be of greater extent than is now the case.

It is important to notice that, under existing police administration, the State in Great Britain, it is usually possible in practice to compel young persons to work, whether they desire to do so or not. The extension of these powers to the obligatory employment of all men, whether they are or are not sentenced by law to penal servitude, does not appear to have been carried out in practice.

The Unemployed Workmen Bill of 1897, promoted by the Independent Labour Party of the United Kingdom, provided that unemployed men might be sentenced to work under the control of a committee of public officers where they are sentenced by law to penal servitude. The Bill has been reported on, but the report of the Committee has not been published.
ENCRATITIS

(Ἐ'κρατίτης [Iren.] Ἐ'κράτατιον [Clem. Alex.], Ἐ'κρατία[ί]ον [Hippol., Epiph.]. — Christians of the early Church who made abstention from flesh, wine, marriage, and possessions their rule of life. From the middle of the 2nd cent. they stood midway between the larger Christendom and the Marcionite Church as well as the Gnostic schools (Harnack, Hist. of Doctr., Eng. tr., London, 1894-95, ii. 43). Without holding one form of creed, or being organized as a body, they practised everywhere the same kind of asceticism. Their spirit was widely diffused. Epiphanius, in his chapter εκατοντα (Hebr. 47), mentions the convert of six Minor, in which they abounded (Ἀποστημ. 12, 52) says that some of the earliest of them were followers of Saturninus and Marcion. Eusibius (HE iv. 28) appears to mistake in calling Tatian, the convert of the convert, the one described by Eusebius (Hist. Eccl. i. 29, 2), and Epiphanius (loc. cit.), in placing the Encratites after the Tatianites. What Tatian did was to join the sect, and to give it a more complete canon, including the Epistles of St. Paul, whose teaching other leaders, especially Severus, rejected. There must have been a considerable Encratite literature. Several writers, both for and against the principles of the sect, are now little more than names.

In the time of Marcus Aurelius,曼斯... is said to have written a very elegant work Ἰστορίας τοῦ Ἐκρατίτου, addressed to a convert who had retired from the truth to the heresy of the Encratists, which had even then made its appearance, and which introduced a singular and pernicious error into the world (Euseb. HE iv. 23). Theodoros (Harr. Hist. 21) mentions Apollinaris, another writer of the same period, who wrote about the Novatian Encratists and Marcian (Mor. 43) states that an Encratite leader, Demetrias, a Cilician, wrote a defense in eight books, containing that "by sexual intercourse the world had had its beginning, and by continency would receive its end." Clement, in whose Stromata (ii. 3) quotes a passage from this work from the 1st, 91, 92.

The influence of the Encratites may be ascribed to three causes. (1) Their renunciation of the world was strikingly complete. They had the great merit of being logical. Having grasped a principle, they applied it with the utmost rigour and vigour. They rejected the prevalent distinction between the Church and the world, and considered itself efficient, morality. The Church, which assumed their counsel of perfection in the few, resolutely declared war against their principle when they sought to make it an inflexible rule; for they refused to follow the Church, scorning the weak compromise she offered. They insisted that, if ἐκκρατία was right at all, it was right universally. To be a Christian was to be an Encratite. (2) The Encratites pointed to the life of our Lord. They made the "evangelic life" their standard, urging that the Christian system of morals must be founded on the actions of Christ, and take its laws from Him. The life of celibacy and the renunciation of all worldly goods, after His pattern, was the essential mark of Christian perfection. Tatian wrote a book, Πρὸς τοῦ κατά τρίον κακονομευόντος (Clem. Alex. Strom. iii. 12), in which he showed that the Christian idea of life must be attained only by the imitation of Christ, and rallied the Church to the duty of walking in His steps. The writer forgot, as Clement wisely observes, that "this was not a common man" (ἐστὶ ἀνωτέρως οὐκ εἰσεχεῖν).

HE was deficient in a right understanding of the life of Christ in its completeness, and in its relation to His mission as the redeemer of the world, and the destroyer of Divine life, which, in the further course of its development from Him, was designed to establish and pervade all human relations (Naundor, Church Hist., ed. London, 1881, i. 127). Tatian wrongly regarded Paul as teaching (1 Cor 7) that marriage and unchastity are one and the same thing—both being the service of Satan. With Marcion and Saturninus he asserted that wedlock was only corruption and formation (τέλείωσεν κατακολοπεύων [Eus. HE iv. 29]). In forming his opinions, it is probable that he made use not only of the canonical Gospels, but of apocryphal histories, in which the delineation of the Person of Christ had been modified under the influence of theosophical and ascetic principles. Epiphanius states that the Encratites used the Acts of Andrew, John, and Thomas; and the fragments of Cassianus found in Clement seem to reflect the Gospel according to the Egyptians.

(3) Encratism generally based itself on the same prevalent doctrine of God and the world as Gnosticism. Some Encratites, indeed, professed to be orthodox. Those whom Hippolytus describes (Phil. viii. 29) are admitted by him to have been found in their teaching the same (ἐργασίας ἡ ἐκκρατίας, and ἐκκρατίαν), and Epiphanius (loc. cit.), in placing the Encratites after the Tatianites. What Tatian did was to join the sect, and to give it a more complete canon, including the Epistles of St. Paul, whose teaching other leaders, especially Severus, rejected. There must have been a considerable Encratite literature. Several writers, both for and against the principles of the sect, are now little more than names.

not the eradication but the consecration of nature. In the right sense of the word, every Christian must, of course, be ENSORGEH (used only once in NT, viz. Tit. 1). Roman governor trembled (Ac 24: 23); he names it as part of the fruit of the Spirit (Gal 5: 22); and another writer mentions it as one of the graces which are to be added to faith (2 P. 1). But true self-control (ἐγκυραία ταυτόν [Plato, Rep. 390 II]), ἑγκυρατά ἀδικίαν καὶ τεντονίαν [ib. 430 E]) is not to be attained by otherworldliness which shrinks life’s duties, and shuns its pleasures as temptations of the flesh; and, therefore, its true virtue is far from according with the mind of Christ, who wished His followers to be the haven of society, the salt of the earth, the light of the world (Mt 5: 14).

Socrates (v. 11) mentions the Eleatics as a sect existing in Galatia in the time of Julian, when Basirios, one of their number, suffered. One of the laws of the Theodosian Code (A.D. 381) was directed against the Manichaeans, who sheltered themselves under the name of Eumen. But the Eleatic controversy was, on the one hand, swallowed up by the Gnostic, and, on the other hand, replaced by the Montanistic (Harmack, Hist. i. 238).

Literature.—In addition to looks already named, see A. Harnack, Die Verbreitung der Urchristlichen Lehre, Leipzig, 1884, esp. p. 5434; cf. also art. 'Eleatics,' in Smith-Wace, DCB; and Krämer, 'Enkraitai,' in PRE.

JAMES STRAHAN.

ENCYCLOPÆDISTS.—See THEOLOGY.

ENCYCLOPÆDISTS.—1. Rise of the Encyclopædistic movement.—It may truthfully be said that the appearance of Hume’s Treatise of Human Nature (1739–40) was the starting-point of a new school of thought. Locke had devoted himself to the explanation of the origin of our ideas; he told us that we owe our conception of substance to the long-continued habit of seeing certain modes in association one with the other; or—to put it in a word—Locke denied the existence of innate ideas, and declared that all our knowledge springs from experience. But Hume asked the question, How do we know that two things stand to one another in the relation of causality? Because we usually see one thing follow another thing, we simply come to the conclusion that it must so follow. Self is merely a complex of swiftly succeeding ideas, under which we imagine an illusory soul or self to exist. Soul, this complex of ideas, must hence cease to exist, the soul being, as we have seen, a thing of the past.

As the last throws off all ideas of a spiritual being, it at once ceases to exist. Thus it was that Hume’s scepticism naturally followed Locke’s empiricism in the order of thought, and all our knowledge was reduced to perception of sense, leaving us with sensation alone to take the place of the old determination of universality and necessity. The point of view arrived at had a close affinity with the philosophy of the 18th cent. in France. Of the school of thought known as the Illumination, or the Philosophy of the Enlightenment (see ENLIGHTENMENT), the Encyclopædists form a noteworthy part, inasmuch as they represent its spirit in its most characteristic form. In France, this attitude of mind was unaccompanied by the pietistic tendency, wherein inward spiritual experiences were given a value as distinguished from the literal teaching of authority. This tendency was a feature in the movement towards intellectual liberation in the Aufklärung in Germany, even while it seemed to be in opposition to its conclusions. The Enlightenment there concluded its period of clear intellectual conceptions, by means of reason alone, by giving place to a period of sentimentality. In France, as we shall see, this concentration on the value of feeling, as advocated by Rousseau, ended in momentous results on the practical side of politics; while in Germany, where the call for action was not in the same way demanded, it found vent in the rationalism, which resulted in the period of Sturm und Drang, and in Romanticism in literature.

It was in France, however, that the empirical or Lockian school was carried to the utmost logical and logical consequence of sensualism and materialism. Empiricism developed in France as it never did in England, despite its being derived so largely from the writings of Englishmen. The French reformed the Lockian virtue of the speculative position which they adopted with the clearness and logical characteristic of their race; and this resulted in a thoroughly materialistic conception of the system of the world, and in an egoistic morality.

But the growth of the speculative and sceptical attitude of mind that took the place of the idealism which had proceeded from Cartesianism gives us but one aspect from which the rise of the new school of the Illumination can be explained. Along with the speculative side, there were two other influences at work which had as great an effect on contemporary thought as that which was purely intellectual, and which was complementary to it. The first was the rise of the scientific spirit, which, though it may have begun in France with Descartes, was developed in a remarkable way by Isaac Newton. Newton made men realize that the 'physical laws which hold good on the surface of the earth are valid throughout the Universe.' The mechanical conception of Nature formulated by Kepler, Galileo, and Descartes became, through Newton, intelligible to all. Men were shown how the machine worked, while it was also demonstrated to them how it is held together by means of the law of gravitation. Newton’s philosophy, on its speculative side, did not have much influence on contemporary thought, but practically his teaching and method had an effect which can hardly be overestimated. He popularized the so-called scientific view of Nature and made it intelligible, and this scientific outlook had the effect of making the world around of immense interest and importance in every one of its aspects, and presented infinite possibilities for those who were prepared to open their eyes, and have unveiled to them the things that had hitherto seemed hidden or mysterious. It also held up before them the hope of attaining the happiness sought by all, and this kind of knowledge only every seeker after truth. It was Voltaire, in his Lettres sur les Anglais, who introduced his countrymen at large to this new way of looking at the world; it was he who contrasted the old learning and the old religion with the new; it was he who popularized the views which he had adopted, applying scientific methods to supernatural and superstitious beliefs. The light of day was to shine out unobscured by the accretions of the ages. Voltaire expounded Newton’s theory of Physics, and wrote a Dictionnaire philosophique portatif (1764), which set forth his views on these and similar subjects from the standpoint (though officially contradicted on occasion) of a sceptic in religion and a materialist in philosophy. The visits of Voltaire and Montesquieu to England had great results, for they brought home with them new ideas in religion, philosophy, and the relations of man to man.

But there was still another cause in operation which made for the new empirical point of view. It is to be found in the general social condition of France at the time. A desolate court and a despotic government, on the one hand, and a Church both hypocritical and tyrannical, on the other, had, each in its respective sphere, alienated
not only the poor and suffering, but all thinking men, such as were the *philosophes* of the 18th century. The impulse on their part was to resist the tendency of the age to accept the precepts that were enounced. When they applied their clear reasoning powers to the corrupt order of things that obtained at the time, there was little doubt of the result. The undreamed condition of matters then existing was to them the order of things established by authority, and, if they were to vindicate for rational mankind the possession of its reason, the first thing to be done was to show forth the irrationality of a state of things whose existence was a disgrace to a nation, and revolting to every intellectual principle and moral feeling. The *philosophes* did their part effectually, and possibly prepared the way for the nation to do the rest in a manner as yet undreamed of.

2. The Encyclopædic spirit.—Thus had the way been paved, and men had now reached a frame of mind in which they were ready to accept the scientific and sceptical doctrines as expounded by the new philosophers. It had at last come home to them what was the significance of the point of view from which it is recognized that law governs everything: this ordnance of the Deity, the ‘law’ which was well-nigh excited to the place of the Deity of former days, arbitrary enough though that, was now regarded too much as a power working outside of us, and independently of any ideal or developing force which might guide its operations and bring with it a unifying influence. The way was perhaps made too plain and clear to be accepted as the way of Truth, so evusive to those who search after it as an end. The mysteries remained mysteries even after the artificial wrappings were removed, and the very superstitions were found to conceal certain aspects of truth, in addition to the falsehood that could not be overlooked. Nevertheless, the wrappings had to be removed, and it was rightly thought that an organized systematization of all known knowledge in the arts and sciences would help in bringing about this end in the most effectual and practical way possible. Goethe says in his *Dichtung und Wahrheit*: ‘If we heard the encyclopaedists tell of the immensity of their work, we felt as if we were going between the immovable moving spoons or looms in a great factory.’ But, though the knowledge of the process by which his coat was made at length disgusted Goethe with the coat itself, that knowledge had to be acquired along with the rest of the scientific and systematic knowledge of the day.

3. The Encyclopædia.—What, then, was this work which gave a name to a whole group of thinkers in the middle of the 18th century—that time of which d’Alembert remarked that ‘the middle of the century was apparently destined to form an epoch in the history of the human mind by the revolution in ideas which appeared to prepare for this event’? The first volume of the Encyclopædia appeared in 1751, and at this time the *philosophes* who took part in it were considerable in number. They were also, as a matter of fact, not all of one mind: there were among them atheists and deists, and the personal jealousies and antipathies against them were not small. But a splendid optimism carried them along in their great work—an optimism which meant belief in the best elements of humanity, in natural goodness instead of natural depravity, and in the possibility of human perfection under suita-
and Rousseau for Music. But all the contemporary
so-called the time were called upon to assist in
some way or other—Voltaire, Euler, Morellet,
Montesquieu, d'Anville, d'Holbach, Quesnay, and
Turgot, the leader of the new school of economists
who was soon placed in the Encyclopedia. In the
supplementary volumes, Haller, the great physiologist, took
part, and Condorcet, whose fate was to be so tragic in the days of the
Terror. History and Biography were excluded entirely when they came to
incumbency, and the object of the book being frankly utilitarian, know-
ledge was held to be worthy of the name only if it led to some useful invention or discovery.

The prospectors describing the work as one which
would form 8 volumes, with at least 600 plates,
appeared in November 1750, but before that time
Diderot had had much trouble with his pledged
contributors, who were mostly in arrears with their articles.
To make his difficulties greater, he himself was imprisoned at Vincennes on 29th July
1749 for 28 days, and then kept for three months
and ten days a prisoner on parole at the castle, on
account of his book entitled 'Les aveux de
D'Anville.' This, however, did not stop the printing, though,
of course, it caused delay.

The clerical party was not long in realizing the
power of the new work, and they set to work a plan which
led to the apprehension of the decree of the
National Assembly of 12 October 1748, and gave a new outlook on the world. It
showed a powerful influence was being directed to
be in the direction of attacking its enemies, and the
dissenters especially were jealous of the fact that
they had not been consulted regarding the articles
on Theology or Religion. They were not appealed by the fact that Diderot and d'Alembert
themselves had been among the signers of the
statement in character. The more cautious amongst the Encyclo-
pedists likewise became alarmed as time went on.
Montesquieu declined the articles 'Democracy'
and 'Despotism'; Buffon, though he wrote on
'Nature' in 1765, did not love the Encyclopedists;
Voltaire, Duclos, Rousseau, and Turgot gradually
separated themselves from the atheistical party,
though they had been identified with the new
crime at the beginning. The first volume of
the Encyclopedia appeared in 1751, and the second
in January 1752. Jansenists vied with Jesuits in
attacking it. The Abbé de Prades, one of the
collaborators, was the first to suffer. He had sus-
tained a remark of which he was so deeply
offended that he criticized miracles, comparing certain of them with
the eure of Jesuapius. Diderot was suspected of
being its true author. It was found to be
unscientistic and atheistic by the authorities, and the
Abbé was condemned by the Sorbonne, without
a hearing, by 82 votes against 54. He was degraded,
and fled to Germany to escape further punishment.
Diderot wrote an 'Apology' in his favour—a
moderate and well-argued document. The two
volumes of the Encyclopedia that had so far
appeared were ordered to be destroyed, by a decree
of the King's Council on 7th Feb. 1752.

As a fact, the real object was to advertise the
work. Indeed, the freethinkers were evidently
gaining ground. Jansenist and Jesuit
were alike reproached for the intestine rivalries
which made the Church and its ceremonies fall
into contempt. The Government did not iner
maintain its rigorous attitude, and tried to support
first one side, then the other. But the incom-
petence of the Church favoured the growth of the
liberal spirit. Malebranche, Director-General of the
Librairie, almost openly favoured the philoso-
phers, and it was reluctantly that he was forced to
issue the decree of 1752. This decree, however,
contained no prohibition of the continued publica-
tion of the Encyclopedia, or of carrying on an
active propaganda by means of brochures warmly
accepted by the public, who delighted in finding
the Episcopal mandates denounced. The publica-
tion of the Encyclopedia itself was regularly
continued from 1753 (when vol. iii. appeared) until
vol. vii. was finished. Diderot had a remarkable triumph. Just after the
decree he was compelled to hand over his papers to
the Jesuit cabal, who thought they could them-
selves have carried on the work. In this they soon
found themselves mistaken, and the Abbé de
Prades was forced to make application in May 1752 to
Diderot to continue the work which his genius was
alone able to accomplish.

The publication of the seventh volume the ferment was renewed, and storms arose which
brought the whole agitation to a crisis. The
popularity of the book was extending. The
subscribers had increased from barely two thousand
for the first volume to double that number for
the seventh, and the indignation of the clerical
party grew in proportion. Diderot, d'Alembert,
Voltaire, Rousseau, and Buffon were all supposed
to have been according to tenancy; it was carried as an
argument to overthrow the existing society. D'Alembert,
after being the guest of Voltaire at Ferney and
visiting Geneva, wrote an article in which he praised the Geneva ministers for the purity of
their lives, and it was, if possible, increased by the publication by Helvetius of his
book De l'Espiril in 1758. Helvetius, a generous
protector of the philosophes, set forth, in four
dissertations, opinions often stated in his hearing,
and his book was published under royal privilege. The Sorbom recon-
demned it, as an abridgment of the Encyclopedia, and was said to be
scandalous and licentious. Helvetius finally
retracted his statements and left the country, and the
philosophes themselves felt that harm had been
done to their cause by the book. The Council of
State suppressed the privilege conceded to the
Encyclopedia in 1746, prohibited the sale of
the seven volumes already printed, and on 8t March
1759 disallowed the publication of any further
volumes. This was after a commission of the-
ologists and lawyers had been appointed by the
court to examine the work, but before they had
reported. It was supposed they did not wish actually to destroy the movement, but
merely to adopt such a policy of encouragement or
repression as was most convenient to the politics of
the time, or possibly such as the caprices of a royal
mistress might dictate. An enormous amount of
money was involved in the concern, which was an
additional complication. The 4000 subscribers had
paid in advance their subscriptions of 114 livres
apiece. Diderot had prepared 3401 plates, for
which, by an absurd anomaly, a privilege was
given, as though they could be of value without
the text. The printing, however, went on as
before, 500000 readers being constantly engaged
upon the work.

It was in 1758 that Rousseau severed his con-
exion with the Encyclopedists by his celebrated
letter to d'Alembert on 'Stage Plays,' in reply to
the latter's celebrated 'Geneva,' which he had
assailed the doctrine that the theatre is an inven-
tion of the devil. But this was, of course, only
the reason assigned for what implied a real break
between the emotional school and that of pure
reason. The beginning had been reached of that
reign of sentimentalism which, while maintaining
the cult of the primitive man as against the pro-
duct of civilization and reason, introduced the
theory of government by means of the sovereign

ENCYCLOPAEDIATIS

"general will," which was soon to be carried to its extreme consequences with such momentous results.

Rousseau's accession was, indeed, a severe blow to Diderot, who had struggled so bravely against essential difficulties, and whose death was but a harbinger of a still heavier blow to follow. D'Alembert, his fellow-worker, exhausted by continuous persecution, at last declared his intention of resigning his task, and advised Diderot to do the same. 'I am worn out by debates with the affronts and vexations of every kind that this work draws down upon us.' Even Voltaire was persuaded that d'Alembert was right, but it was in vain that he pressed his views on Diderot. 'The latter felt that to abandon a work so begun would be to play into the hands of his opponents and to show a pusillanimous and feeble spirit. Weary as he was of insults from the enemies of reason, he resolved to 'go back to the Encyclopédia.'

It was seven years more before the enormous task was brought to a close, and this consummation was made possible only by the protection of Mme de Pompadour, de Choiseul, and Malebranche. And it was to d'Alembert himself that the labour of carrying it to a conclusion fell. Not only had he to write articles on every sort of subject, to edit them, and to see to the arrangement of the engravings as well as supervise their production, but he had to do all this in constant fear of interruption by the police. And in the end the production of this immense enterprise, which enriched three or four publishers, left him who had done so much for it a poor man. He himself asks if it is not strange that this is so, but characteristically adds that, after all, he is 'too happy to have lived.' And the final result of his labours, not only to civilized Europe, along with that of his stupendous work. It was towards the close of it that one of the hardest trials of the many that he had suffered had to be endured. After the delay of 1760, le Breton was entrusted with the printing of the ten remaining volumes in a single issue. Instead of carrying out his orders, he altered the articles in such a way as to delete every reference or statement that might be provocative to the Government, and consequently he mutilated the whole so that it was deprived of all that was most valuable in it. To make matters worse, the original manuscripts were lost, and on the death of a friend of his in whose digestion knew no bounds, and for weeks he could neither eat nor sleep. Yet, though his first impulse was to give up his task, he resolutely persevered in it, and his last impressions of letterpress were issued, though the eleven volumes of plates were not completed till 1772. The general assembly of the clergy on 20th June 1765 condemned the book. This sentence was quashed by the Parliament from hatred to the clergy, but all who owned the Encyclopédia were called on to deliver it to the police, by whom, however, it was eventually returned after some small alterations had been made.

4. The contributors to the Encyclopédia. As regards those who took part in this great work, we must always place Diderot at the head. He was the man amongst the rest who thought out not only his plan of operation, but the scientific method of which the book was the exponent. He was, indeed, the great Encyclopédist, of whom Goethe says that 'whoever holds him or his doings cheaply is a Philistine,' for it would be to show a truly limited understanding not to appreciate at its true value the great idea which Diderot tried to expound—that we must rise not only above the artificialities of the staid school of literature associated with the great French dramatists of the previous century, but also above the artificialities of an arbitrary standard of orthodoxy in religion and an untenable theory of government.

"Enlightenment of the understanding," meant, above all, the clear vision that penetrated through these mists and condemned all that could not be distinctly comprehended as unworthy of further notice. It was, in fact, the task of the Encyclopédia to show by the examples of many of them, appearing in the last ten volumes of the Encyclopédia. His special department in the work was supposed to be Philosophy and the Arts and Trades, but he undertook articles on a miscellaneous number of subjects besides. The minutenest care was expended by him in the reproduction of the plates, and it is said that in the chief departments of industry these would serve for practical specifications and working drawings. Diderot himself visited the workshops, examined the machines, had them taken to pieces and put together again, and even learned to work them. In the Encyclopédia attention was, of course, specially concentrated on the physical sciences and the practical arts. Things which can be seen and handled, ideas which do not indicate mere verbal distinctions, as with the schoolmen, or whose essence is found in formulations of the abstract, were the subjects of the great writers of the age just preceding, are the subjects which most attracted the famous Encyclopédist.

D'Alembert (Jean le Rond), 1717-1783, Diderot's fellow-editor, wrote mainly on scientific subjects; and his works on Mechanics and on Natural Science placed him in the front rank amongst the savants of his time. Moreover, though to us he may not have seemed so profound an author as D'Alembert, it is said to have had the gift of making interesting all that he wrote or said. In any case he obtained great popularity in the salons of the day, more especially in that of Mlle de Lespinasse. But intolerance was his bane, and the anti-religious bent of his mind became a real passion within him. His loss, however, when he retired, disgusted with the difficulties of his work, was a very serious one.

Of the other writers besides Diderot and d'Alembert, Voltaire comes first to our mind; he was incessant in his industry and ready to accept any article submitted to him, of whatever kind, and he grumbled at nothing when his thought was honest and helpful in telling his friends where he thought they had erred either in taste or in fact. He had the good sense to maintain his objections to the unorthodox, and if he was sometimes adopting, of allowing statements which they could not justly to appear because of the exigencies of the time. 'Time will enable people to distinguish what we have thought from what we have said,' d'Alembert had to confess. But, before condemning this attitude of trimming the sails to suit the wind, we must recollect the courage that had been already required to say what had been said in face of physical danger, in 1719, by the time of Louis XV., the Government claimed the right to direct not only the conduct but also the opinions of the subject. The existence of this right, still maintained by him, was one of the causes of the breach which took place with another of the original contributors, Jean Jacques Rousseau. He upheld the right of suppressing, by means of the secular arm, opinions that were anti-social. But what was really distinguished Rousseau from the Encyclopédist was the fact that his ideas were determined by feeling, while the philosophy of the Enlightenment declared that the right to be determined pre-empted only. The artistic renaissance called Romanticism was to come as a reaction from, and at the same time as a comprehensible development of,
rationalistic doctrines of the French philosophers. Rousseau had the power of sympathizing with the unenlightened, the outside people whom Voltaire designated as 'la canaille,' because he rested his philosophy on those elemental sentiments which were common to all; and the intellectualists consequently failed to comprehend him, as he certainly did not understand them.

Among the other notable Encyclopedists, Hélène must be mentioned. Of his book De l'Esprit we can only say: It confused rather than added to the public interest, and it is not perhaps any other book of the time, as tending, in the minds of the orthodox, to engender hatred against Christianity. Even the friends who, like Diderot, admired his work most declared to support the principles on which he rested his judgment. Hélène's diatribes against the existing Government and the Roman Catholic religion made for revolution rather than for reform, and self-interest and pleasure were frankly advocated as the basis of justice and morality. His philosophy, if philosophy it may be called, was founded on sensationalism in its extreme form. It is the belief that whatever opinion we have is not profound or convincing, without being the author of a thought-out doctrine of Utilitarianism he helped to inspire Bentham, his great advocate.

The author of the Système de la nature (1770), which was often ascribed to his intimate friend Diderot, and part of which the latter probably composed, or at least inspired, was the pro-sperous and hospitable friend of the poorer Encyclopedists, while he also entertained friends from every part of Europe, including Hume, Priestley, and other Englishmen. He gave vent in no stinted terms to his indignation at the existing forms of religion, his conclusions that we had grown up through centuries were alike condemned by him without any effort on his part to determine their real meaning or value; and, unlike some of the other Encyclopedists, he did not restrict his attacks to superstitions or mere sentiments, but boldly advocated war between the governors and the governed. Intellectual deliverance was to him but the first step to converting thought into deeds. In reading Holbach now we come to understand how, when these doctrines were drunk in with avidity, the revolutionary maxims so soon became converted into facts.

The pamphlets of Holbach are but one type of Encyclopedists. We have, on the other hand, Turgot, who wrote anonymously some of the most valuable and weighty articles in the book, which he regarded until he came to distrust its sectarian spirit, as a great instrument for the enlightenment of mankind. Then there was Montesquieu, who died in 1755 and left behind him an unprinted article on 'Taste'; and there were others who, until division arose, contributed to give dignity to the undertaking.

5. Value of the Encyclopedia.—The Encyclopaedia itself was unequal, as might be expected from the difficulties under which it was composed and from the prejudices with which to pay contributors; some articles were inferior, and, as Voltaire pointed out, they constantly suffered from verbosity and dogmatic modes of expression. D'Alembert himself confessed that this was the case, and Diderot was dissatisfied with the work. The attitude adopted to religion is not by any means consistent any more than the rest. It was attempted that dogmatic atheism was preached, though on the whole the attitude of the book is, of course, critical of orthodox beliefs. The main attack is, however, against Sacerdotism, against a Church that was corrupt, and against priests who were enemies to society. The object was to teach the value of Science and the reign of Law, and, thereby, to take away interest from the miraculous. The Encyclopedists found such continual occupation in the world as it revealed itself to them that they were content to leave alone what was beyond. The goodness of human nature, in their eyes, seemed to have been developed in a way more thorough by Rousseau and his followers later on, bad education was held to be responsible for social failure, as bad laws and bad government were blamed for a corrupt State. The earth in which we live is of more interest than a heaven of which we can know nothing surely. Francis Bacon's idea of the systematic classification of knowledge made it seem possible that such classification should be made, and Bacon may be said to have inspired the idea of the Encyclopaedia. Diderot himself said that he had 'taught his fellow-citizens to read Bacon.' Newton and Bacon were in the ascendant in the century which produced what Carlyle calls the 'Polemics of a Mechanical Era.'

It is interesting to reflect that from the Encyclopedists proceeds much of the social spirit of modern day thought. Indeed, it seems not that the Encyclopedists contributed anything to prevent misery rather than supply refuges for the miserable; he is preaching the latest doctrines in social economics. This, indeed, implies more than the need of society, and that is a religious truth which is, perhaps, as abstract as the other, because, just as we think the machine is being brought into perfect working order, we are pulled up sharply by finding that the individual rebels at the foundations that have been laid for a beautiful mechanical contrivance, and insists on asserting his individuality. Still, on the whole, the new science is the more hopeful and inspiring of the two, especially to those whose minds require some logical reason for their actions, and who do not want to be controlled simply by sentiment or by the ascetic spirit of religion.

All who played their part in this 'Encyclopedic workshop,' as Comte named it, were bound together in a common fellowship by their work on a common book, in a way probably never known before. But their failing was doubtless that of being abstract. The Liberalism of the Enlightenment had the faults as well as the virtues of certain forms of Liberalism in a later age. It freed itself from shackles that were imposing progress in the search for truth. It failed, however, to see that there were in the old rejected forms certain elements of truth that had been overlooked. The Encyclopedists did not consider that, even if knowledge of the useful arts and sciences were brought to perfection and the abuses that menaced society swept away, there would still be the eternal desire for some further explanation of the how and why, some fresh effort to comprehend the mind that understands, and give a unity to the conglomerate facts presented to it.

E. S. HALDANE.
END (Germ. Zweck, Ziel, Endziele [primarily spatial]; Fr. fin, but).—The point towards which a process or act is directed; the object of a desire or purpose, as the possession or operation of a process or act. The concept of end is one which enters specially, though not exclusively, into the interpretation of human action. Thus, the scientific worker is said to be aiming at the accurate determination of some aspect of reality, the artist to be striving after a satisfactory form of expression, the moral agent to be adjusting his conduct to certain standards of right living—in each case, that is to say, there is an end to which the agent is determined to act, just as the artist's operations are determined by the kind of mechanical construction which it is in his mind to produce. The efforts made to express the content of these ends and to relate those in each move to one another in a systematic manner are referred to as constituting a normative or a regulative science. Thus, Logic, which deals with the ends or ideals of scientific activity, Aristotle, which deals with those of artistic production, and Ethics, which deals with those relating to moral action or conduct, are spoken of as essentially normative sciences. Aristotle made the familiar philosophy through his well-known doctrine of the four causes (destination), in which he distinguishes the "final cause"—to give it its scholastic name—'the purpose or goal,' from the formal cause, the material cause, and the efficient cause. 'The final cause,' he says, 'operates like a loved object' (Metaph. 1074b, 3). He applies this conception not merely to the interpretation of organic process and moral behaviour, but to the interpretation of the whole of reality, including the physical universe.

Material causes are only intermediate—merely the means and indispensable conditions of phenomena. Above them stand final causes; above material necessity, the design of the universe; above the physical explanations of nature, the teleological! (Zeller's Aristotle, Eng. tr., 1897, I, 438 f.)

We thus have the arduous debate between Mechanism and Teleology explicitly opened—a debate which continues to our own time, and to which the most recent interesting contributions are those of the Neo-Vitalists and H. Bergson (see TELEOLOGY).

A distinction may be made between an end which can be conceived or presented as the object of voluntary process and an end which is not so presented, but is inferred from the facts of experience. To 'final purpose.' To 'Natural goal of progress, the Summum Bonum, would be instances of this type. Sidgwick has this distinction in view when he contrasts the Good attainable by human effort and the notion of an Ultimate Good (Methods of Ethics1, p. 2). These two types of end are distinguished by Baldwin respectively as 'subjective end' and 'objective end'—a distinction which is not to be confused with Kant's distinction of subjective and objective finality in the Critique of the Judgment. This terminology is liable to misinterpretation under the ordinary acceptance of 'subjective' and 'objective.' Subjective goal generally implies an element of contingency and arbitrariness, and those characteristics are not necessarily attached to ends of the first type; these ends may satisfy all the tests of objectivity. It would seem to be closer to the facts to distinguish them as 'explicit' and 'implicit' ends.

It is the explicit end of which we have direct experience. This is a cognizable element in the conscious process. In purposeful activity we are aware, by inspection, of an idea or image of some situation or object which is controlling the process. We are conscious of an orientation of the conscious stream in that direction, of a desire for it, of a striving towards it. This conative tendency, as it is called, is maintained and furthered by the presence of the expectation of an actual process or act.

For the this end...
state of society emerged in which they stood to one another not as kinsmen, but as fellow-citizens. The tribe became the nation, and the ties of kinship lost much of their compelling and restraining power. But the old feeling against aliens persisted under the newly determining principle of the spirit of nationality. Among the ancient States, especially in the East, all foreign nations were regarded, practically as enemies. In Greece, as, for instance, in the Peloponnesian wars, this antipathy towards strangers was partly due to religious reasons, the monolatry of Judaism stamping all outsiders as heathen and idolaters, enemies of Jehovah, the one God. But the feeling was not different both in the Greek city and States and at Rome, where a stranger, unless specially commended to protection, was regarded as having no rights at all. In Greece he was everywhere distrusted, and free Sparta excluded all. In Rome he could obtain justice only by the friendly offices of a citizen.

In considering the writings of Plato and Aristotle, so far as they bear upon this question, we have already pointed out that the political and social 'enemies' has no place in Greek ethics. In the Philebus (49), we find Socrates remarking that it is not wrong to feel joy in the woes of enemies, who should be very few indeed, to rejoice in the misfortunes of friends. He also describes barbarians, that is, foreigners, as natural enemies of the Greeks, and condemns war (and the common methods of warfare) only when waged between the Hellenic tribes, which were bound together by the ties of race and religion (Republic, p. 470). In the Laws (v. 729; ix. 579; xii. 949f., 952f.), Plato goes on to discuss the treatment of strangers in Greece, and makes several suggestions of reform. But the high-water mark of Greek thinking on this subject is perhaps attained by Aristotle in his criticism of the guardian class in Plato's ideal State (Repub. ii. 375f.). He complains that the guardians are to be savage to strangers, although affectionate towards their friends, and he uses these words: 'It is not right to be fierce towards any one, nor are magnanimous natures ever savage, except towards persons who injure them' (Pol. iv. 7). Aristotle presumably is thinking of direct personal injury, or of the feeling of enmity which Socrates regards as justifiable between the inhabitants of the ideal Republic and the individuals in a foreign State who are responsible for initiating war against them (Plato, Repub. v. 471).

In these and earlier times the utmost cruelty was permissible towards enemies. Feroce and lawless savagery characterized all phases of primitive society. Revolting customs were sanctioned by highly civilized States. Hence, even in Aristotle, whose views on war were far in advance of his time, insomuch as he disapproved of it as an end in itself, we find no criticism of methods of warfare and conquest which we should describe as barbarous. He saw the land of the conquered partitioned, and the vanquished subjected to slaughter and outrage or sold with their children to slavery; but he seems to have found a sufficiently satisfactory explanation in the consideration that these atrocities were committed against 'barbarians,' people who were 'by nature' slaves. Plato, too, found such practices revolting only between Hellenic tribes, and he makes Socrates express the wish that in the ideal Republic the Hellenes should reserve for war with barbarians the treatment which Greeks now mete out to each other (Repub. v. 471).

The responsibility of beginning and conducting war has not long been the prerogative of States. Under the feudal system of the Middle Ages it was especially common for war to be declared by powerful lords, by cities, or by provinces. Gentilis, the predecessor of Grotius, was the first publicist who defined war, much as we should define it now, as the just or unjust conflict between States. In Roman law the term 'enemy' meant an alien to States, an individual between whom had passed a formal declaration of war. But the Roman jurists, except for certain rules regarding the person of ambassadors, hostages, the keeping of the laws, and the like, laid Jewish law as to the treatment of non-jews to the Jews themselves. Ideas of justice to an enemy treated as an ally to the conquered appear for the first time in the Hellenic wars. The Romans, in their treatise de Juris Belli ac Maris, defined the principles influence the Paxia, did more humanitarian count day, a traveller practice of States. At the present day, war is as, and even or resident in foreign territory is penal, when he is answerable to, the law of the land. In and the abroad, war arises between the aims he is, as, as he conducted himself, he is depending on the individual, indeed, is not usually account the enemy of the State with which the government to which he owes allegiance is at war. War is under- stood by and to be fought not, not only between individuals, but not between individuals as such, although an individual may during war acquire what is termed enemy character, either as the owner of property or because of acts done by him as a private person. On the other hand, in so far as business relations are concerned, the subjects of belligerent States are enemies. All ordinary intercourse must cease until the war is at an end.

Hostilities are confined upon the official of general rules which combatants cannot violate without exciting the reproach and risking the interference of the civilized world. Prisoners and non-combatants alike are free from the severities of war, and in defeat their persons can be subjected neither to slaughter nor to outrage. Only such methods are legitimate as are absolutely necessary to weaken the forces of the enemy and compel them to yield, and which in so doing do not bring useless suffering are rigidly excluded. Rules relating to the practices of assassination and devastation, and to the use of poison and of arms and projectiles which inflict needless tortures are forbidden by the Brussels Convention of 1899. The Brussels code has not yet been made law, but nations which have since that date engaged in war have adhered to the principles embodied in it. See, further, art. WA.

ENERGY.—A term borrowed from the Greek to express the mechanical idea of the 'power to do work.' Its etymological import is something in action or a name for action itself. It is thus the equivalent of 'force.' Sometimes it is a synonym for 'force' (q.v.), which has the same definition, and so means to denote the fact that effects do not take place without causal action, and this causal action for Mechanics is substance or matter in action or motion. But energy also, as denoting 'power,' implies capacity to do work without representing the 'force' or matter as actually in motion. Hence it was divided into 'potential' and 'kinetic' energy. The potential energy is force or matter in a static condition, one which
represents the mere capacity of producing work, but not the actual fact of producing it. Kinetic energy is 'force' in action or actually producing work. Thus snow lying on the mountain side may be conceived as potential energy. But when melted into water and flowing down the stream it is kinetic energy. A boat resting without strain is potential energy; the same spring bent or pressed down and exerting strain is kinetic energy. Hence any matter or force in a passive or static condition resembles potential energy. If in motion or exerting pressure, strain or pulling power, is kinetic or dynamic energy.

In the practical problems of Mechanics it becomes important to measure energy, and some standard for the purpose had to be obtained. The first step in the direction of obtaining such a standard was to assume some constant form of energy and measure it in some way. It was known that it took a certain amount of energy, not measured, to raise 1 lb. a foot high, and twice this amount of energy to raise 2 lb. the same distance, or 1 lb. two feet high. This relation served as a means of determining some criterion by which to measure the amount of energy doing work, and this criterion could be found in the amount of work done. This unit of work done is called the 'foot pound,' and it is divided into the 'kilogramme metre.' Hence, we may determine this; hence we may take the energy employed in moving an object a given distance vertically as the equivalent of gravity, and so obtain a standard for its measurement.

In fixing this standard 'we must choose our unit of work,' says Balfour Stewart, 'but in order to do so we must first of all choose our unit of weight and of length, and for these we will take the kilogramme and the metre, these being the units of the metrical system. The kilogramme corresponds to about 2.205 aerial pounds, the metre to about 39.37 inches. Now, if we raise a kilogramme one metre in vertical height, we are conscious of putting forth an effort to do so, and of being resisted in the act by the force of gravity. In other words, we spend energy and do work in the process of raising this weight. Let us agree to consider the energy spent, or the work done in this operation, as one unit of work, and let us call it the kilogramme-metre. In the next place, it is obvious that if we raise the kilogramme two metres in height, we do two units of work, if three metres, three units, and so on. And again, it is equally obvious that if we raise a weight of two kilogrammes one metre high we likewise do two units of work, while if we raise it two metres high we do four units of work. From these examples we are entitled to derive the following rule:—Multiply the weight raised (in kilogrammes) by the vertical height (in metres) through which it is raised, and the result will be the 'work done in kilogramme-metres.'

By a process based upon the velocity which gravity gives falling bodies it is possible to calculate this energy, and so to determine a formula for practical use in mechanical operations. This calculation shows that energy is proportional to the square of the velocity of objects. Taking M to stand for the mass and V for the velocity, this formula is arrived at.

\[ \text{energy} = \frac{1}{2} M V^2 \]

Now gravity accelerates the velocity of falling bodies at a certain constant rate. One half of this divided into this formula gives the actual amount of energy expended in the operation. Hence \( \frac{1}{2} M V^2 \) represents the formula for measuring the amount of energy in any special case.

The total amount of energy in the world is supposed to remain the same at all times. This conception of the constant sum of the ' conserve energy.' The sense in which Mechanics or Physics asserts this doctrine is that the sum of potential and kinetic energies remains the same in all operations, and not that there may be an operation by which it can be added or subtracted. If a ball is propelled upwards at a certain velocity its energy will be measured by the formula above given, and it will come to rest when gravity has overpowered its first kinetic energy. The initial velocity represents energy of the kinetic sort. When completely arrested its energy will be potential. At any point between the initial motion and its stoppage the sum of the potential and kinetic energies will be equal to the kinetic energy at the outset, the potential energy being nil at that point. This is what is meant by a conservative system, and the expression Conservation of Energy expresses the fact.

Another import has been given to this doctrine in the idea that the kinetic energy of a system remains the same in all transformations, and it gives rise to some difficulties in accounting for the phenomena of change, especially of change from kinetic to potential, from dynamic to static conditions. The best conception of this situation is Correlation rather than Conservation of Forces or Energy. The former suggests a conception of identity which seems not to be a fact in the transformations. Hence, in consequence of this equivocation in the doctrine of the Conservation of Energy, a controversy arises between philosophy and mechanical science. But, with the correction of the phrase suitable to the different problems involved, there is no occasion to do more than insist upon the distinction between energy and work. The criterion of the relevance of the physicist's inference from his mechanical use of conservation to the denial of the philosopher's doctrine of change, especially of facts that involve change, is obvious.

Recently a doctrine of 'energy' has arisen which regards it as a 'substance.' The mechanic treated it as a property or quality of matter for doing work. But certain metaphysical propensities, on the one hand, and the implications lying at the basis of the distinction between kinetic and potential energy, on the other hand, created the need of a term for something which the scientific metaphysician—for that is what he was—wanted to distinguish from matter, on the one hand, and its properties, on the other. 'Energy' was thus made distinct from 'force' and 'matter.' It might be at the basis of both, but it was distinct from them. Ostwald is perhaps the leading representative of this school. It does not express anything different, however, from that of those physicists who conceive the ultimate basis of material phenomena in terms of matter or ether, and only serve to eliminate the idea of inertia where 'matter' seems to imply it. We see, therefore, no reason for attaching any special importance to the doctrine.

JAMES H. HYSLOP.

ENHYPOSTASIS.—The term is one of a series—'hypostatical union' 'anhypostasis,' 'enhypostasis'—used to cast light on the constitution of the Person of Christ. The Christology of the Council of Chalcedon (A.D. 451) postulates in Christ the unity of two distinct natures—the Divine and the human—in a single person. This is called in theology the 'hypostatical union.' Since, however, the personality is assumed to belong exclusively to the side of the Divine—i.e. it is the eternal, pre-existent Son who has entered humanity—it would seem to follow that the humanity of Christ must be conceived of as 'im-personal.' Christology, therefore, has been very generally affirmed the impersonality (anhypostasia) of the humanity of Christ. But the difficulty is obvious—How can an impersonal humanity (i.e. no individual) or be conceived of as one of them? And is it not the very peculiarity of man as rational being in his possession of self-consciousness and will? And is a being possessing these attributes not already personal? To answer these objections, the idea was put upon of describing the humanity of Christ not as 'im-personal,' but as 'en-personal.'
The doctrine of *enhydrosis* is already met with in Leontius of Byzantium (A.D. 483-543), but is specially developed by John of Damascus (c. A.D. 740) in his *De Fide orthodoxa*. He connected it with the doctrine of the Trinity in order to oppose to Nestorianism, that the human nature of Christ never subsisted in a personality of its own; that it was assumed by, and subsisted only in, the person of the Divine Logos. As a result, it avoids the unfortunate suggestion (which is not in the least intended) in the word *enhydrosis* of a possible independent impersonal existence of Christ's human nature, and lays emphasis on the idea that its humanity from the beginning subsisted 'in' the person of the Logos. Plainly, however, this does not remove the essential difficulty that it is a Divine, not a human, personality that we have in Christ. Many modern theologians would solve this by rejecting altogether the doctrine of the two natures, and boldly affirm that the personality lies wholly in the humanity; but it is very difficult to keep this view from passing into *theoria apanta* (Logos theory) from which it is to be found, it is probably in the line of recognizing the essential kinredness of humanity to the Logos in which it is grounded, and which, in the incarnation, appropriates humanity to itself as the foundation of its own personal manifestation. The Logos is the personal centre, but under conditions truly and perfectly human—'The Word became flesh, and dwelt among us.'

JAMES ORR.

ENLIGHTENMENT, THE.—In its most general sense the term 'Enlightenment' (Germ. *Aufklärung*) indicates the first of the two periods through which modern thought has passed; or the development of philosophy from Bacon's *Novum Organum* (1620) to Kant's *Kritik der reinen Vernunft* (1781). But a more critical view of the period, with its characteristic ideals, reveals the fact that the beginning of the period must be dated from Hobbes (1589-1679) rather than from Bacon, whose freer and more cultural philosophy belongs to the Renaissance. As a further limitation, it must be observed that the Enlightenment hardly included the greater philosophic works which appeared contemporaneously with it. Though Locke (1632-1704) was connected with the movement, it was not by means of the *Essay concerning Human Understanding* (1690), but through his unphilosophic works on rights and government, that the connection was sustained. Spinoza (1632-1777) in his *Ethica* (1677), with its Cartesian foundation, was innocent of the movement; but in his *Theologico-Political Writings*, inspired as they were by Hobbes, he takes up some of its peculiar problems. In his *Treatise on Human Nature* (1738), Quito was as studious as Locke to avoid the rationalism of the Enlightenment, whose principles he criticized in his *Dialogues concerning Natural Religion* (1777). Kant's relation to the movement is discoverable, not in the *Kritik*, but in his lesser works on natural rights. Thus appearing in the minor writings of the greater, the philosophy of the Enlightenment was elaborated by a number of anti-philosophical thinkers, who ignored the fundamental problems of logic and ethics, for the sake of settling practical questions of Church and State. Nevertheless, the Enlightenment possessed the spirit of a genuine philosophy, even where it was malleable or unwilling to pursue its method. This spirit was a regressive one, according to which the age endeavoured to return to the fundamentals of dogmatism. In 1650 the tendency manifested itself in the desire to premise a first principle of all thinking, the *cogito, ergo sum* (*Meditation 11*); Locke was equally anxious to elucidate the native principle of cognition when he styled the mind a *tabula rasa* (*Essay*, bk. i.). The same radical spirit was shown not only in philosophy, but in church and state. Thus Herbert of Cherbury sought the true faith in the original *religio naturalis* (de Veritate, 1624), and Grotius attempted to find the true principle of law in the *jus naturale* (*Jus Gentium*, 1625). But it was by the regressive spirit of the 17th cent., consisted in establishing contrasts between things established by authority and tradition and those erected through freedom and reason. This conflict between reason-rights and tradition-authority thus recalled the ancient Sophist contrast between *phos* and *stoa*, the exact reiteration of which may be found in Cudworth's *Treatise concerning Eternal and Immutable Morality*, 1678 (bk. i. ch. i.). The practical result of the enlightenment was a desire to create an opposition to history, the source of tradition and authority, and to instil a belief in the eternity of 18th cent. ideals; coupled with this dogmatism was a strong reaction against the rational and an antipathy to the ideas of progress. Emancipating itself from the past, and feeling no need of a future, the Enlightenment was possessed of an optimism which believed that man was able to solve all problems and cure all ills. The leading questions of the Enlightenment had to do with (1) *Natural Rights*, (2) *Free-thought and Toleration*, (3) *Rational Christianity*, and (4) *Natural Religion*.

1. Natural rights.—It is with the name of Hugo Grotius (1583-1645) that the history of Natural Rights begins. Anticipated by Bodin's *Six Liéres de la République* (1570), with its insistence upon the historical theory of rights, as also by Gentilin's *de Jure Belli* (1588), with its direct deduction of rights from Nature, Grotius' great work, *de Jure Belli ac Pacis*, was able to make use of the empirical in the one and of the rational in the other. The psychological basis upon which Grotius rears his juristic system was found in man's natural tendency towards the formation of society; this is attributed to the social instinct within him, as also to the particular gift of language, with its social possibilities (op. cit., Prolegomena, §§ 7-8). From the logical standpoint Grotius argues, from both *a priori* and *a posteriori* principles, that natural rights are self-evident and necessary, that the *a priori* it was urged that *jus naturale* was so native to man that he could not be conceived of as existing without it, while the common consent of mankind argues, as from effect to cause, that, since the principle of rights is universal, it is also necessary to the human race (ib. i. cap. i. xii. § 1). In his enthusiasm over the rational principle of rights, Grotius was led to assume a radical position in theology, in accordance with which he asserted that the principle of rights would hold though we should assume that there is no God (ib. Proleg. § 1). Natural law is thus conceived of as following from the nature of the thing, while the law of God is dependent upon His will. The blunt way in which Grotius expressed this Thomian seems to produce the impression of atheism, and it was to the dual extremes of *ni diez, ni mater* that this philosophy was destitute of. In 1650 the tendency manifested itself in the desire to premise a first principle of all thinking, the *cogito, ergo sum* (*Meditation 11*); Locke was conceived of as coming to man by means of tradition as something authoritative; having thus expressed himself, Grotius creates the dualism of *jus et lex*, *ratio* and *essentia*. It was in this way that the Enlightenment learned to despise the historical and to reposit in the purely rationalistic.

In England, the philosophy of rights was con-
ttined by Hobbes, who developed a theory alien in character to that of Grotius. The failure of Bacon to participate in the discussion is one of the striking features of 17th century thought. Lemuirer says:

"Rommeau at Montpellier became the first to call his colony from Alba the first founder of the Roman State; this colony was in the original state of nature, but the collection is an "overseer" (Life of John Locke, by Fox Bourne, N.Y. 1874, p. 169).

This conception of man's original condition made it possible for Locke to give a more plausible explanation of the origin of the State in a contrast between man and man rather than between man and the magistrate.

The juristic element in the thought of the Enlightenment, fated as it was to become an important factor in the development of Deism (p. 47), was not overlooked by the Deists themselves, however little they had to contribute to the philosophy of rights as such. Indeed, the common doctrine of Hobbes, Spinoza and the uncultured Deists, like Tindal and Chubb, were to meet was the juristic one. Free-thought was thus a much greater leveller; hence Warburton, quoting Swift, said:

"No subject or region could have seguridad than Toland into the class of reputable authors ... no subject but religion could have sunk his lordship (Bolingbroke) so far below it" (Divina Legation of Man, p. 20).

Among the Deists, Tindal was the first to identify himself with the natural-rights movement, in connexion with which he shows himself to be a follower, first of Hobbes, then of Spinoza, and finally of Locke. In his Essay concerning the Laws of Nations and the Rights of Sovereigns (1694), he urges 'egoism' as the 'source of all man's actions and the foundation of his duty to God and man' (op. cit. 121). The Essay on the Rights of Mankind (1697) discusses the status naturalis, while the author's more complete philosophy of rights appears in The Rights of the Christian Citizen (1700), which contains the political philosophy of the Enlightenment with Deism. In this work, Tindal contends against established religion, on the ground that men are in a religious state of nature, 'subject only to God and their own consciences' (op. cit. 2).

Without analyzing the inner nature of the principle of rights, Toland (1707-1722) advanced principles of practical rights and freedom. These appear in his Life of Milton (1699), as also in Anning (1699), the defence of it. A more definite relation to the philosophy of rights was sustained by Toland in his Paradoxes of State (1707), and The Art of Governing (1707) in which his philosophical views are expressed in his Anglic Libera (1707), wherein he discusses questions of political contract and the ideals of a commonwealth (op. cit. 92). Chubb had 'a very meagre relation to the movement, as appears from his Enquiry concerning Property (1717), and Some Short Reflections on the Ground and Extent of Authority and Liberty (1728). Insignificant as were these Deiste attempts at elaborating a philosophy of rights, they are of great value in showing how closely connected were the principles of theology and politics—a connexion which will appear more convincing in relation to the question of the natural condition of mankind.

The purely political philosophy of the Enlightenment, dependent as it was upon Hobbes and Locke, underwent a development which in France was practical, a Geneva speculator, Rousseau, carried out Locke's idea of government by contract, the theory of which he projected in Le Contrat Social (1762). In Germany, Kant attempted a theoretical deduction of jus naturale in his Metaphysische Naturgeschichte der Radchüchte (1777), in which he reasons from the status naturalis, not as though it had been a real condition of mankind, but as a hypothetical condition upon the grounds

naturalis. In this connexion, Locke attempted to show that the state of nature had existed in human history, and thus, in his work On the Roman Commonwealth (1680), he says:

"Rommeau at Montpellier became the first to call his colony from Alba the first founder of the Roman State; this colony was in the original state of nature, but the collection is an "overseer" (Life of John Locke, by Fox Bourne, N.Y. 1874, p. 169).

This conception of man's original condition made it possible for Locke to give a more plausible explanation of the origin of the State in a contrast between man and man rather than between man and the magistrate.

The juristic element in the thought of the Enlightenment, fated as it was to become an important factor in the development of Deism (p. 47), was not overlooked by the Deists themselves, however little they had to contribute to the philosophy of rights as such. Indeed, the common doctrine of Hobbes, Spinoza and the uncultured Deists, like Tindal and Chubb, were to meet was the juristic one. Free-thought was thus a much greater leveller; hence Warburton, quoting Swift, said:

"No subject or region could have segurança than Toland into the class of reputable authors ... no subject but religion could have sunk his lordship (Bolingbroke) so far below it" (Divina Legation of Man, p. 20).

Among the Deists, Tindal was the first to identify himself with the natural-rights movement, in connexion with which he shows himself to be a follower, first of Hobbes, then of Spinoza, and finally of Locke. In his Essay concerning the Laws of Nations and the Rights of Sovereigns (1694), he urges 'egoism' as the 'source of all man's actions and the foundation of his duty to God and man' (op. cit. 121). The Essay on the Rights of Mankind (1697) discusses the status naturalis, while the author's more complete philosophy of rights appears in The Rights of the Christian Citizen (1700), which contains the political philosophy of the Enlightenment with Deism. In this work, Tindal contends against established religion, on the ground that men are in a religious state of nature, 'subject only to God and their own consciences' (op. cit. 2).

Without analyzing the inner nature of the principle of rights, Toland (1707-1722) advanced principles of practical rights and freedom. These appear in his Life of Milton (1699), as also in Anning (1699), the defence of it. A more definite relation to the philosophy of rights was sustained by Toland in his Paradoxes of State (1707), and The Art of Governing (1707) in which his philosophical views are expressed in his Anglic Libera (1707), wherein he discusses questions of political contract and the ideals of a commonwealth (op. cit. 92). Chubb had 'a very meagre relation to the movement, as appears from his Enquiry concerning Property (1717), and Some Short Reflections on the Ground and Extent of Authority and Liberty (1728). Insignificant as were these Deiste attempts at elaborating a philosophy of rights, they are of great value in showing how closely connected were the principles of theology and politics—a connexion which will appear more convincing in relation to the question of the natural condition of mankind.

The purely political philosophy of the Enlightenment, dependent as it was upon Hobbes and Locke, underwent a development which in France was practical, a Geneva speculator, Rousseau, carried out Locke's idea of government by contract, the theory of which he projected in Le Contrat Social (1762). In Germany, Kant attempted a theoretical deduction of jus naturale in his Metaphysische Naturgeschichte der Radchüchte (1777), in which he reasons from the status naturalis, not as though it had been a real condition of mankind, but as a hypothetical condition upon the grounds
of which human rights might be deduced. The process is continued in Fichte's Grundlage des Naturrechts und der Rechtslehre (1796), in which the relation of ego to non-ego is transformed into the relation of the individual to society. A similar application of the Enlightenment's philosophy of rights was made by Schopenhauer, who interpreted the Hobbesian 'state of nature' in the light of the 'will to live' (Volk als Wille und Vorstellung, 1819, § 62).

2. Free-thought and toleration.—Free-thought was the Warren of protest where religious rights were more than speculative ones deduced in a disinterested fashion. This practical tendency reappears in Locke, whose sensationalism would have been as ineffective as Hobbes' materialism if their authors had been called upon to employ speculative instead of practical methods in the controversy. Like Spinoza, Locke insists upon the inwardness of religious belief, and thus argues that,

'although his (the magistrate's) opinion in religion be sound and the way that he appoints truly evangelical, if I be not thoroughly persuaded in my own mind, then there will be no safety for me in following it' (A Letter for Toleration, 1689 [Works, v. 47-50]).

In insisting that speculative articles and opinions should not be imposed by law, Locke was not prepared to consent that 'the right oftoleration should extend to the atheist, for the reason that with him the oaths and bonds of civil society could be of no avail'. As with Spinoza, thought, so likewise with worship; its inner nature is such that it can be conceived of as undergoing no interference from an external power, although the magistrate may with power and right enjoin duties of justice and charity (ib. cap. xvii.). In making this distinction of the inner and outer, Spinoza sought to free science from religion, and to separate philosophy from faith, such a separation constituting the essential aim of his work (ib.). To arrive at this end, he defines one in terms of speculation, the other in those of practice: 'Ratio regnum veritatis et sapientiae; theologia autem pietatis et obedientiae' (ib. cap. xxv.). Not only as a matter of natural rights in the individual, but likewise as the most rational law for the State, is the principle of toleration to be upheld. Such was the motto of Spinoza's work. His relation to Locke was an indirect one, for he made little appeal to the average free-thinker, hence the omission of his name from the list of free-thinkers from Socrates to Locke who Collins gave to 'Powers of the Press' (1718). Nevertheless, Deism was not unaware of Spinoza, while his logic of free-thought sometimes appears in its literature. Evidence of Spinoza's direct connection with natural religion as a system is found in Kortholt's de Tribus Impostoribus (Herbert, Hobbes, Spinoza), 1680. Connected as was his name with these two greater thinkers, Spinoza was supposed to have influenced Toland and Tindal. 'Varenna called Toland the 'mince of Spinoza' (Divina Legation of Moses, iv. 279), and both the pantheism and free-thought of this Deist may serve to indicate the nature of the irritation. While Toland was Tindal's last and fiercest advocate in the controversy over natural religion brought forth the following rhyme:

Spinoza smilis and cries; the work is done.
Tindal shall finish what Spinoza first began.

Without any theoretical preliminary, Hobbes had anticipated Spinoza in proposing principles of toleration, the result of whose application was destined to become momentous in the history of Deism. The principles upon which Hobbes sought to base toleration consisted of two articles of Christian faith: the Deity of God and the Messiaship of Jesus. Belief in the existence of God as an existence, with attributes of a negative, superstitious, or indefinite nature, involves the end of all true worship. That Jesus was Deity was regarded by Hobbes as the other article of free faith, and this simple creed was in his mind the burden of the Gospels and the testimony of the Apostles as recorded by Schopenhauer (cap. xviii.). Rational Christianity and natural religion, with their maxims of the mere Deity of God and the mere Messiaship of Jesus, were thus practical political principles used in a controversy over Church and state, not merely as something to be maintained, but rather as speculative ones deduced in a disinterested fashion. This practical tendency reappears in Locke, whose sensationalism would have been as ineffective as Hobbes' materialism if their authors had been called upon to employ speculative instead of practical methods in the controversy. Like Spinoza, Locke insists upon the inwardsness of religious belief, and thus argues that,

*The author of the Letters for Toleration is the first who has ventured to assert the justice and necessity of toleration in its due and full extent' (op. cit. 139).

Tindal's more independent argument for freedom appeared in his tract, A Discourse on the Liberty of the Press (1698), wherein he pleads for freedom on the ground that, since reason is the only light that God has given man, he will be held responsible for the proper use of his faculties; whence the necessity of a free press, in order that men may perfect their faith by the free interchange of opinion (op. cit. 294). In his Essay concerning the Power of the Crown (1697), Tindal attempts a practical definition as the 'belief of a God, and the sense and practice of those duties which result from the knowledge we have of Him and ourselves' (op. cit. 130). But the most characteristic work on free-thinking that Deism was to produce appeared in 1713, when Anthony Collins (1676-1727) produced his Discourse of Free-Thinking, in which toleration, instead of being derived from speculative grounds, was based upon practical grounds. According to Collins, free-thinking in theology is as necessary as in other sciences, for the reason that theology involves these in its treatment of Nature and history (op. cit. 15). As with science, so with re-
ligion; since uniformity of opinion among men is impossible, it is best for each to judge independently, so that the 'surest and best means of arriving at truth lies in free-thinking' (ib. 33). Collins even goes so far as to assert that the manifest design of man is to seek after the truth, and the Apostles urged them to abandon an established religion for a faith wholly new to them. With regard to his own day, Collins contends that, in view of various alleged revelations, as in the Zend Avesta and the Bible, and owing to the different views of God and the Scriptures within the Church itself, it has become necessary to adopt free-thinking as the only possible means of setting one's self right in religion (op. cit. 48-50). In the hands of Collins the principles of free-thought were separated from the juristic philosophy of the Enlightenment and transformed into the special pleading peculiar to Deism.

2. Rational Christianity.—From its beginning in Hobbes, the theory of toleration had proceeded upon the assumption that the principles of Christianity may be stated in a manner so simple that it will satisfy the free-thinker's law and at the same time content the free-thinker in his claims for the rights of toleration. It was in this mediatorial spirit that Hobbes and Locke had sought to base rational Christianity upon the idea of God as mere existence, and Christ in His mere Messiahship. Now was to follow an independent treatment of the problem. Before Locke had written The Reasonableness of Christianity (1685), Arthur Bury published The Naked Gospel (1690), the aim of which was to advance the interests of natural religion, whose primary principle was faith (op. cit. 10). In the particular case of Christianity this general religious principle was the idea of God as a belief in Christ as the Messiah (ib. 30). Such was also the view of Locke, who outlined his theology against the background of his philosophy of toleration. By appealing to primitive Christianity, Locke argued that, the original article of belief and the sole test of discipleship among the Apostles consisted in the creed that Jesus was the Christ, so that to believe in Christ meant to credit His claims to Messiahship. The first principle of Christian ethics was that of repentance.

These two, says Locke, 'faith and repentance, i.e. believing Jesus to be Messiah, and a good life, are the indispensable conditions of the new covenant, to be performed by all who would obtain eternal life' (The Reasonableness of Christianity [Works], vi. 106).

This simple gospel was in Locke's mind the burden of St. Paul's preaching, and all that he advanced as necessary to salvation. With regard to the Pauline theology, as developed in the Epistles, Locke can only plead that these writings were intended for those who were already Christians; hence they 'could not be designed to teach the fundamental articles and points necessary to salvation' (A Vindication of the Reasonableness, etc., 1685, p. 167). As an empiricist, Locke would have had no right to use the term 'reasonableness,' but his employment of the term was political rather than philosophical, his contention practical rather than speculative. A century later, on the decline of Deism, Kant followed a similar course, except that, instead of passing from rights to religion, he reversed the process; and, having written a rationalistic treatise on Christianity, Die Religion innerhalb der Grenzen der Erkenntnis vermessen (1781), he followed it up with a juristic framework of free-thought, which are found in his Rechtslehre (1797). Thus, from Hobbes to Kant the principles of theology were closely connected with those of natural right.

As the practical phase of Locke's philosophy had been of great moment in the formulation of

the Deistic creed, so the speculative part of his system received Deistic recognition. When Toland produced his Christianity not Mysteries (1696), a work suggestive of Burn's Naked Gospel, Toland's contention was that there was nothing in the gospel contrary to reason, and that Christian doctrine could be called a mystery (op. cit. 6). [For a full account of Toland's views, see art. Desm., in vol. iv. p. 534 f.] The next step in Deism was that of the Zenses, or the universal and acutals as given in the Gospels. Accordingly, Collins, who had completed his theory of free-thought, inaugurated the attack upon mystery when he sought to invalidate the testimony of the prophets. Where William Whiston, in the Boyle Lectures of 1707, had contended for a single, Messianic sense in the interpretation of prophecy, Collins contended that the prophecies usually cited have in them a sense which is not Messianic at all, and that the application to the life of Christ, as in the case of the citations made in Mt 1 and 2, is to be understood in a purely allegorical or mystical manner (The Grounds of Theology of the Christian Religion, 1724, p. 148). The Deistic controversy over this Deistic work which was made by Edward Chandler, in A Defence of Christianity from the Prophesies (1729), so involved the question of miracles that it has been designated as (2). A positive regard as incredible. This negative attitude towards miracles formed the basis of Peter Annet's attack upon the credibility of the resurrection, the Gospel account of which he deemed a forgery (The Resurrection of Jesus Considered, 1744, p. 22).

This destructive treatment of Christianity was accomplished by an attempt to construct a rational Christianity, based upon the teaching rather than the person of Christ. The way for this had been prepared by Hobbes and Locke, in their plea for toleration upon the basis of the mere Messiahship of Jesus, while it was also an expression of the Socinian element in Deism. Lockean and theological Christianity had come in for some criticism as a Socinian work when John Edwards wrote his Socinianism Unmasked (1686), while in Warburton's mind Deism was a 'modern fashionable notion, not borrowed from, but the same with the Socinian' (The Divine Lociation of Moses, i. 56). The most characteristic defender of this milder form of Deism was Thomas Chubb (1679-1747), who made his entrance into the field of controversy by means of his Socinian work, The Supremacy of the Father (1715). Chubb's chief contribution to Deism was The True Gospel of Jesus Christ (1738), in which naturalistic speculative of Hobbes' became variously expressed in a form peculiar to Herbert's natural religion. The essence of Christianity and the person of Christ are treated in a purely utilitarian manner; accordingly, Chubb asserts that what fits a man for future felicity tends to make him happy here, so that, when the gospel is found to subserve man's present and future well-being, it may be called 'true' (op. cit. 4), just as the author of it may be called the species of which are found in his Ichthalekre (1797). Thus, from Hobbes to Kant the principles of theology were closely connected with those of natural right.

As the practical phase of Locke's philosophy had been of great moment in the formulation of
condemnation will be meted out according to conformity or non-conformity to the rule of right action. In addition, the principles of natural religion, Claub had abandoned the hedonism of Hobbes for the rationalism of Cudworth and Clarke. In the same spirit Thomas Morgan (1743) attempted to connect the gospel with the religion of reason. As a rationalist, Clarke intended to demonstrate the natural religion of Christ and the spurious religion of St. Paul and his followers; and, just as Lessing distinguished between the religion of Christ and the Christian religion, so Bolingbroke declared that the Gospel of Christ is one thing, the Gospels of St. Paul and all those who have grafted after him on the same stock, another (Philosophical Works, 1754, p. 313). Christianity was to Bolingbroke 'a complete but plain system of natural religion' (ib. 316). The apotheosis of its mysteries of prophecy and miracle, the Christianity of Deism had become identified with the system of natural religion.

4. Natural religion.—As the doctrine of natural rights, with its corollaries of free-thought and toleration, had led to the formulation of rational Christianity, so natural religion employed a different logic to arrive at the same conclusion. The first triumph of Clarke's system was inaugurated by Grotius, with its practical; the second, which sprang from Herbert, was speculative. Herbert's work de Veritate, appearing one year before that of Grotius, investigated and natural instinct in its logical form as Grotius examined its ethical nature. Both thinkers attempted an a priori deduction of a natural principle, whose existence in human nature was then corroborated by an a posteriori investigation of human history; in both alike we find the appeal to the instinctus natura and the consensus universitas. (The contents of the de Veritate will be found in art. DEISM, vol. iv. p. 553.) Herbert's view of religion, naïvely conceived, and wanting in the inexorable rationalism and secularism of the Enlightenment, was destined to be prophetic rather than constructive in the career of natural religion, whose fundamental principle was that of the 'reason of things.' Hence, after the appearance of Herbert's work, the interest of the Enlightenment pursued the jurist of Grotius rather than the rationalist of Herbert, the two tendencies meeting in the 18th century of the 18th century.

This unity of natural religion and natural rights appeared in Charles Blount (1693), who considered Herbert's five articles of universal belief to be the best ground for toleration (Religio Laici, 1683). In Blount's The Grotian of Isaac (1683), the term 'Deist' is found, this being one of the earliest instances of its occurrence.

Without any dependence upon Herbert, Samuel Clarke exercised the same speculative freedom manifested in the former's de Veritate, while he enriched Deism with something like a theistic philosophy. Written in opposition to Spinoza, as also to Hobbes, Clarke's Demonstration of the Being and Attributes of God (1714-1719) was so devoted to the 'nature of things' as a first principle that it never freed itself from a kind of Spinozistic pantheism—a fact which did not escape the notice of Clarke himself in his An Observations on Clarke's Sermons (1705), where in recent years its importance has been reconsidered by J. Zimmermann (Samuel Clarke's Leben und Lehre, Vienna, 1870).

While his logic is closely connected with that of the reason of things, Thoristic and Cudworthian in the extreme. With his implicit faith in the mathematical analogy, Clarke asserts that God must be thought of as eternal and necessary, just as twice two is must be thought of as the result of the operation of being. God is thus the ground of His own existence (Works, 1732-1742, iii. 5). Identified with the nature of things, the Deity is called upon to will in accordance with the necessities which these things impose. In this context Clarke insists that ethical behavior is a determinant of the real; thus he says, 'To will things to be what they are not as absurd as to believe that twice two is not equal to four' (ib. ii. 336).' To this extent Clarke is seeking for a complete and self-sufficient natural religion, but the emphasis laid upon the ethical seems to involve as its consequence the abrupt change to revealed religion, for the reason that he will not be able to perform what the intellect recognizes as fit and necessary. Accordingly, Clarke's metaphysical dogmatism is pursued by a moral scepticism, which declares that, perfect as the reason of things may be, the falsity of acting contrary to such a standard is not sufficient to deter men from vice, because its pursuit is often accompanied by pleasure and profit, while pain and calamity may follow upon virtue.

'This alters the case, and destroys the practice of that which appears so reasonable in speculation, and introduces the necessity of rewards and punishments' (ib. 60).

This apparent lapse into hedonism was really an appeal to the idea of future rather than present happiness, as will become evident from the following plea:

'It is neither possible nor reasonable that by adhering to virtue men should part with their lives, if thereby they deprive themselves of all possibility of receiving advantage from that adherence' (ib. 697).

The doctrine of future rewards was thus the connecting link between natural and revealed religion, for, on the side of the Deity, this idea was fundamental, since 'God by express declaration of His will in Holy Scripture has established and confirmed the original difference of things' (ib. 907).

While from the human standpoint the principle of reward and punishment is necessary as a motive to impel the will towards that which the understanding recognizes as right in itself.

Early in the field of natural religion, Shaftesbury (1709-1715) attempted an optimistic and aesthetical view of the world, which had something of that tendency towards pantheism which Deism ever betrayed. Shaftesbury uses the term 'Deist,' which he considers the 'highest of all names' (The Moralists, 1711, ii. 311), and more strenuous methods of rights and reason were foreign to his thought. The leading motive with Shaftesbury seems to be that of harmony within and without; to perceive this harmony constitutes religion, to promote it is the chief concern of morality. On the ethical side, he pursues the idea of harmony in connexion with his analysis of human nature, which is supposed to evince three tendencies: natural affections which tend to public good; self-affections which lead to private benefit; and unnatural ones which are harmful both to self and to society. To these, conscience or the moral-sense is added (ib. ii. 98, 119).

The nature of virtue is such as to relate man to the world as a whole; hence, as Shaftesbury says, 'If any creature be destroyed, unless it be destroyed with respect to the universal system' (ib. 20).

Furthermore, he speaks of virtue as 'proportional affection' (ib. 40), while he asserts that the affection of a creature towards the good or common nature is as proper or natural to him as it is to any organ, part, or member, that work in its known course and regular way of growth (ib. 78).

At the same time, the mind is called upon to perceive the harmony in the world without, for
virtue is impossible in a 'distracted universe' (ib. 735). He had realized that the systems of Shaftesbury and Clarke are in conflict; for, where Clarke sought to advance to the realm of revelation through the cracks in the natural order, Shaftesbury postulates a perfect world-order whose inner and outer harmony is in striking contrast to the distracted universe of the other system, and claims that without this the practice of virtue is in vain.

The influence of Clarke is to be observed in the most important of Deistic works, Deism as Old as the Creation; or the Gospel a Republication of the Law of Nature (1739), written by Matthew Tindal (1656-1738). [See art. DEISM, vol. iv. p. 537 f.]

The famous reply to Tindal and to Deism in general which Butler (1692-1752) framed in The Analogy of Religion, Natural and Revealed (1738), was not so much opposed to or free from the exponent of perfect natural religion as ever optimistic; he thus contends that the imperfection attending revealed religion is one which natural religion is called upon to share, so that all that may be said in its favor is as a criticism of the other. Indeed, Butler's ethical pessimism and his armed resistance to it are the permanent results of his traditional system. In his ethical speculations, he utters an ever-memorable lament over conscience, when he says:

'Tis express myself with caution, lest I should be mistaken to vitiating reason; which is indeed the only faculty we have with which to judge concerning anything, even revelation itself' (ib. ch. iii. §1).

Butler's position, however, differs from that of the Deists, in that he is pessimistic where the exponent of perfect natural religion is ever optimistic; he thus contends that the imperfection attending revealed religion is one which natural religion is called upon to share, so that all that may be said in its favor is as a criticism of the other. Indeed, Butler's ethical pessimism and his armed resistance to it are the permanent results of his traditional system. In his ethical speculations, he utters an ever-memorable lament over conscience, when he says:

'Had it strength, as it has right; had it power, as it has residual authority, it would absolutely govern the world' (Serm. iii. 24).

and, when in the world he discovers 'infinite disorders,' he is still able to postulate a theory of the moral government of God, the actual operation of which in the present immanent condition of things is manifest as a 'tendency' (Analogy, I ch. iii. §§ 4-5). [Cf. art. BUTLER.]

The decline of Deism is to be noted in Thomas Morgan and Bolingbroke. Morgan is of historical value in connecting Clarke with the controversy, for it was from Clarke that he derived his Deism. In speaking of the famous expression, 'the reason of things,' Morgan says:

'I mean the same thing by it that Dr. Clarke does; while he grounds the whole of natural religion upon this principle' (The Moral Philosopher, 1738, iii. 311).

Morgan further reveals the influence of natural rights, for he criticized the Mosaic law in the light of the Grotian jus naturale, and expressed Jenzel's attitude towards Elijah after he had slain the idolaters of Ahab by saying: 'She thought this method contrary to the law of nature and nations' (ib. iii. 314). Bolingbroke began to cast suspicion upon the authenticity of natural religion by searching for evidence of it in history. The Hobbesian status naturalis he regarded as a condition of the world in which man was, not irrational, but 'artless'; when he searches this native condition of mankind for traces of the religion of Nature, he can only say:

'It cannot be proved without the help of the Old Testament, nor very well with it, that the unity of God was the primitive belief of Mankind. I must think it sufficiently established that the first and great principle of natural theology could not fail to be discovered as soon as men began to contemplate themselves and all that surrounded them (ib. 203). A glance at the ancient Egyptian religion, the worship of the Chinese, and the faith of King Solomon would suggest the possibility of this.

With the application of history to the scheme of natural religion the end of Deism begins; at the same time, the rationalistic force of the Deistic argument began to lessen, as is shown by the appearance of Dodwell's Christianity not Founded upon Argument (1742). With no theory of knowledge to guide him, Dodwell assumed the standpoint of intuition, or religious consciousness, whereas he was able to offer Deism a refutation by saying, 'There is no medium between believing and not believing' (op. cit. 6). With the actual content of religion as the basis of his argument, Dodwell turned tepid and compromise (ib. 27). Dodwell's work, which constantly touches the fringe of a genuine philosophy of religion, was of great importance as a human document, while it amounted to little as a controversial production, for the reason that it took a stand against both Deism and orthodoxy; Dodwell himself seems to have possessed something of the humanism of both Lessing and Rousseau, while his particular mood was one of mysticism.

The complete downfall of Deism was due to the scepticism of Hume (1711-1776), who applied the rationalism of his fellow-countrmen the results of natural empiricism, in the work of Herbert of Cherbury. [See art. DEISM, vol. iv. p. 537 f.]

Another attack upon reason in religion was made by Rousseau, while the historical context of his work was emphasized by Voltaire in his Essai sur les moeurs des nations (1768). [See further, art. ENCYCLOPEDISTS.] Deism in Germany was organized by H. S. Reimarus (1694-1768) in his Wahrheiten der naturlichen Religion (1734). Lessing (1725-1781) was involved in the religious controversy, and in so far assumed the rôle of a Deist; but his humanism and sense of historical values saved him from being submerged in the tremendous waters of natural religion. His attempt at a philosophy of revelation was made in his book, Die Erziehung des Menschenge schlechts (1780). In addition to the opposition to the static philosophy of the Enlightenment, the late 18th cent. began to emphasize the thought of: —an idea wholly alien to the speculations and political ideals of the period. Bodin (1530-1597) had attempted this problem in his philosophy of rights; Vico (1646-1744) introduced it into his Scienza nuova (1725); Targot expressed it more definitely in his Les Progres successifs de l'esprit humain (1759). The rationalistic method of the Enlightenment, which had boasted rational faith in the concrete conception of things, was set at naught by Kant's Kritik der reinen Vernunft. In spite of its blind
faith in what is called 'Nature,' the Enlightenment had the advantage and performed the service of emanicipating the human spirit from the trammels of dogma; for, it laid the foundation for philosophy in things necessary in themselves and universal in their application, as appears most convincingly in its systems of rights and religion. The enthusiasm is at this very antipode of the Enlightenment, which glorified the static and rationalistic where the present upholds the dynamic and realistic.

CHARLES GRAY SHAW.

ENTHUSIASM.—The word ἐνθυσία (1) is of relatively late origin. The only term in the earlier Greek vocabulary that could be used to denote a condition of psychical excitement or inordinate exaltation was μανία, a word of very general connotation. It is characteristic of the Greeks that they spoke even of the 'madness' of poets, corresponding to the more precise μανικια των ρωμαίων of the Romans. Subsequently the word μανία was sometimes used in the same sense, and the term 'intoxication,' therefore, is not to be literally interpreted. Intoxication emanating from Dionysus, the god who incarnates himself in wine; and, accordingly, the μανία αἰδών, the guerdon of Orphic mystics in the other world (cf. A. Dieterich, Ἀγκυρα, Leipzig, 1893, p. 80, note), really signifies their final union with the deity, and is thus, as we shall see, identical with an eternal enthusiasm. We find mention likewise of an intoxication in which the poet creates his work—an idea which is connected in a special way with ἀρετή, the most impassioned of the Greek legends; legend even tells us that, while he was still young, Dionysus appeared to him and kindled in him the fire of poetic creation (Atheneus, 229). Ἀρετή is the key-note to us, but it uses the verb ἐνθυσάμεθα in intimate connexion with ἑαυτῷ (frg. Ἑρακλ. 558 [Nauck]); then comes Ἐρυθρείς (Troades, 1844), with whom ἐνθυσάμεθα virtually means 'to ravish.' The earliest use of the substantive ἐνθυσάμεθα, with its doublet ἑνθυσίας, occurs in Plato; and the correlative idea operates largely in his writings. But even the root from which these various forms are derived, viz. ἐνθεος, with its corresponding verb ἑνθυσαίεσθαι, 'to be enraptured,' is not found, so far as we know, before the 5th cent. B.C., the earliest instances of its usage being respectively ἄρετή, ἑρυθραία, ὁμοῦ τεθρόνει, and ἑρυθραία, ἑρετικός, I, 63.

It can hardly be doubted that these terms came into use with the rise of the Mysteries and the spread of prophecy, for here the idea of a union with deity that exalts the favoured ones above all earthly things is pronounced part; when the deity enters into a man, the resultant state is enthusiasm. The word ἐνθρόνος, which occurs in Proclus, in Timaeus, 1, 64, 14, 23, and other writings, is used to denote 'being enthroned by a god on oneself' (Roaioi, Dict. týmων. de la langue grecque, Heidelberg, 1907 ff., p. 254). The term

1 The present article is intended merely to trace the origin and ethical content of the (Greek) term; cf. further Korrer and Ebstein (Religious) for the part that 'enthusiasm' had played in religion.
true reality, but only a few are able to summon up the remembrance thereof. Those who were devoted, however, hold themselves aloof from the ordinary pursuits of life, and, uniting themselves with God, are reviled by the multitude as mad, while, as a matter of fact, they dwell apart in the enthusiastic state. In Plato's judgment, accordingly, enthusiasm is the medium of a direct intuition of the Divine—a vision which is granted to the philosophers alone (Phaedr. 249 C).

Their vices, however, are grounded with popular ideas, reappear in Plutarch (Zeller, op. cit. v. 179 ff., with relevant quotations). According to Plutarch's exposition, when the soul is in a state of enthusiasm, it receives immediate intimations from God; upon enthusiasm, indeed, rests all higher revelation. The more effectively the soul represses its own activities, preserves its tranquility, and frees itself from the sensuous, the more delicate becomes its receptive faculty; and consequently the best medium of Divine revelation is sleep or an abstentious life. The intimations of the gods are conveyed to the soul by demons, while material agencies, such as the vapors of the Pythian grove, may also avail, with the consent of the gods and the aid of demons, to induce the enthusiastic state. Enthusiasm always comes spontaneously, and the suddenness of the illumination is the distinguishing characteristic of the whole phenomenon.

Plutarch defines enthusiasm as an affective state (πάθος) of the soul, but Aristotle had characterized it more precisely as a παθός peculiar to the psychical ethos (Pol. viii. 35). The special power of inducing the enthusiastic condition is ascribed by Aristotle to the music of Olympus (loc. cit.)—a view that suggests other related phenomena. In ancient Hellas an important factor in orgiastic celebrations was boisterous music (cf. e.g. Eurip, Bacch. 126 ff.), which was regarded, no doubt, as a means of exciting emotion, just as it forms an accompaniment to ecstatic actions among the less civilized races of to-day. The Greeks could not but feel, however, that the music of the orgies was of a barbaric kind. Their own music was always marked by the quality of dignified repose, and did not naturally lend itself to the expression of joy, or pain, or enthusiasm (Gevaert, Hist. et théorie de la musique de l'antiquité, Ghent, 1857-58, i. 37 ff.).

The power of producing enthusiasm was associated with the Phrygian and Lydian modes and with the music of the old Muses (cf. Plut., Moral. ii. 1), and very likely the Phrygian and Lydian modes have the explanation of the above reference to the music of Olympus. It would seem, moreover, that the Aristotelian school were specially interested in investigating the influence of music upon the emotions; for, apart from Aristotle's own disquisitions in Pol. viii., we hear of a work by Theophrastus, 'On Enthusiasm,' in which, according to frag. 57 (Wimmer), the effects of music were discussed. The subject was, of course, one of special importance, as music was a leading element in ancient education (Arist. loc. cit.).

At the close of the classical period of philosophy stands the imposing figure of Plotinus, in whose writings, as in those of his pupils, the terms τοῦθα and τὸ κατὰ πάντα play a great part (cf. Diehl in the Index to Proclus, in Timæus, iii. 425; Proclus, in Irenæus, ed. Kroll, Leipz., 1801, ii. 440). But it is quite evident that 'for Plotinus the union of the human soul with τὸ κατὰ πάντα properly means its separation from the body, and thus implies the concept of an ecstatic mind of disembodied being at all.'

LITERATURE.—This is indicated in the article.

1. RADERMACHER.

ENTHUSIASTS (Religious).—This article deals with certain teachers of religion, who have believed themselves to be directly inspired by God to impart new truth. They may be classified according to their attitude to previous revelation. Some have appealed to it as the basis of their teaching; others have forsaken it, and have based their teachings upon the Bible or other sacred writings; while a third group have denied the authority of any such written standard. The first group of enthusiasts, in their literature, frequently concentrating on apocalyptic, or interpreting on special lines—as the Catholic Apostolic Church. Others, in supplementing existing revelations, tend to supersede them—as Muslims and Mormonism. Enthusiasts believe in one God, and hold themselves to be in such close touch with God that they do not value previous prophecy; of such are the Bábís. Thus not all the new theologies are imitable; Muggleton, Swedenborg, and Adam and Eve have had no followers. In every case, however, enthusiasts believe inspiration to be generally diffused. All these classes of theological Enthusiasts are treated separately; and the Hebrew Prophets, noblest of the type, will be dealt with in art. Prophecy (Hebrew).

1. Our study may begin with Christian prophecy, a phenomenon of great importance for some two centuries. From the first it was avowed that the prophet would not be a permanent feature in Christian life (1 Co 13), but meantime prophecy was a gift of Christ (Eph 4) to men and women (Ac 2), for the benefit of the Church and occasionally of outsiders (1 Co 14). Like their Jewish prototypes, the Christian prophets could use symbols (Ac 21); but, unlike the Greeks possessed with spirits of divination (Ac 16), they had their spirits under control (1 Co 14). In Greek circles there was clearly a sharp distinction between the one and the other, in some quarters (1 Th 5), and authoritative repudiation of some false prophets (1 Jn 4). A typical product of such Enthusiastic ministry is seen in the Apocalypse, with visions and predictions which yet, in their literary form, show manifest signs of elaborate study (cf. 1 Jn 1, 3). This book is the only one in the NT which puts forth explicit claims to inspiration (Rev 1, 22); but these were pitched very high, and were accompanied with orders for public reading (12), at once ensured acceptance, even outside Asia and its seven Churches.

Another specimen of an Enthusiast's work is the Shepherd, with its visions to Hermas, leading up to the coming of an angel, who imparted much information which the seer was told to commit to writing and circulate. Some of the more striking doctrines are the importance attached to guardian angels (Mand. 6) and the elaboration of the terms of salvation; baptism is the means of forgiveness (Sim. 9), and sins after baptism can be forgiven only once made (1 Cor. 11). The Church have their opportunity by the preaching of the apostles and teachers when they themselves died; but, even then, baptism in Hades is necessary (Sim. 11). Sins are carefully classified (9-12), and ways of supererogation allowed (5). Great stress is laid on the doctrine of the Church, and the risk arising from false prophets is frankly recognized (Mand. 11). This tendency became more pronounced with Ignatius, who hoped that God might reveal something to him (Eph. 20); but he pointed emphatically to a new path when he claimed that the preaching of the Spirit prompted the message (Phil. 7): 'Do nothing without the bishop.'

2. The conflict foreshadowed in 3 John came to a head on the uplands of Asia Minor, when the Montanists objected to the new officialism. They claimed that for generations they had not lacked inspired prophets; and the revelations that came from their leaders were akin to Biblical prophecy and apostolic. Others believed themselves to be in such close touch with God that they do not value previous prophecy; of such are the Bábís. Thus not all the new theologies are imitable; Muggleton, Swedenborg, and Adam and Eve have had no followers. In every case, however, enthusiasts believe inspiration to be generally diffused. All these classes of theological Enthusiasts are treated separately; and the Hebrew Prophets, noblest of the type, will be dealt with in art. Prophecy (Hebrew).
about A.D. 178, some bishops hardly appeared to advantage; the Montanists thereupon rallied all the conservatives throughout the Empire, with the combined appeal for separation from the world to high and low, and protested against the mere word or letter of prophecy. For a generation they held their place within the general federation of churches, but at Rome and at Carthage the prophets were obliged to yield way, leaving the office to perfect the machinery of the Great Church. After the days of Zephyrinus and Tertullian, Montanism shrank to the dimensions of a mere local sect, almost negligible; even its Chrysogon the succession of the prophets ceased. [Cf. art. MONTANISM.] Henceforward, in the West, all claims to direct inspiration were steadily discredited by the orderly instinct of Rome, and until the disruption of the 16th cent. all evensense was speedily checked.

3. A few cases may be noted. Towards the end of the 12th cent. arose Joachim of Fiore, in Calabria, who won the ear of four successive Popes, until a new religious order was sanctioned, and his writings were widely read. He taught that the age of the Spirit would begin with A.D. 1290, and he sketched in detail the events of the sixty years preceding. Starting from the Apocalypse, he and his many disciples set up a new age and a new kingdom. The Franciscan order was permeated with his views, and, when it divided, the Spirituals clung to them; with their suppression, and the obvious failure of Joachim's predictions, the school died a natural death. A Lombard enthusiast, Wilhelmina 'of Bohemia,' claimed to be an incarnation of the Spirit to save the Jews, Saracens, and false Christians; her sect was exterminated soon after her death in A.D. 1321. In Thuringia, A.D. 1360, from the midst of the Flagellants (q.v.) came Conrad Schmid, an incarnation of Enoch, who founded the Brethren of the Cross; the Inquisition prevented the unfolding of a constructive programme. Among the Taborites, prophets appeared who foretold the speedy end of the age, and incited to war in order to clear the way for the reign of Christ. This intensified the resolve of the authorities to nip all such movements in the bud, and they burned Hans Döhn, who in A.D. 1476 claimed a commission from the Virgin Mary. Savonarola's claims to angelic visions won him great popularity, till he flitched from the demands of his admirers and his order of fire. The Alumbados of Spain, professedly holding intercourse with the Lord and with the Virgin, were equally put down; even Teresa of Castle was viewed askance, and her writings were severely censured. But their influence was more than a practical religion, more than with theology, and side with the Counter-Reformation.

4. The Hussite levies showed striking results in A.D. 1521. At Zwickau, midway between Prague and Eisleben, dwelt a Silesian weaver Nicholas Storch, who had apparently lived among the Taborites. When he was hacked by Thomas Müntzer, an educated Saxon sent by Luther, he soon joined into a prophet. Luther having disappeared after the Diet of Worms, Storch went to Wittenberg, and convinced the leaders of the reality of his mission. Luther hastily returned, and admeted his claims, and forbidding a miracle to substantiate Storch's claims. The latter withdrew to Silesia and Southern Germany, dying at Munich in 1525, accepted on all hands as inspired, though he killed Luther's addendum that it was Satan who inspired him. Meanwhile Müntzer went to Prague, and announced the dawn of the new dispensation, with the redress of all social grievances. Returning to Saxony, he initiated a communist system, which he declared to be Divinely ordered. Banished by Luther's influence, he spread his views in Nürnberg and Swit-zerland, and then returned to Mühlhausen, through districts where the Peasants' War was raging. Here he convinced them of his mission, so that their social programme was backed by the conviction that it was dearen word or letter of this prophet. With the massacre of Frankenhausen in 1525, Müntzer died, and the first phase of this prophetic movement ended, Hans Hut confining himself to mere exposition of the Apocalypse in his book on the Seven Seals.

5. A leather-dresser from Swabia, Melchior Hoffmann, was teaching east of the Baltic; then in 1528, at Helm, he published a short Exhortation to his Livonian Converts, containing an application of Dn 12; and he proceeded to calculate the end of the age, which he fixed for 1533. From Sweden he worked through Denmark and Friesland to Strassburg, where he arrived in 1529. Here he devoted himself further to exposition of the Apocalypse, expanding the idea that the few years left were the period of the Two Witnesses. Presently joined by his chief apostle, Leonhard Storch, and Ursula Jost, he himself became Elijah, the inspired interpreter. Driven out from the city, he toured through the Netherlands and Westphalia, quite transforming the northern Anabaptist movement. The Franciscan order was permeated with his views, and, when it divided, the Spirituals clung to them; with their suppression, and the obvious failure of Joachim's predictions, the school died a natural death. A Lombard enthusiast, Wilhelmina 'of Bohemia,' claimed to be an incarnation of the Spirit to save the Jews, Saracens, and false Christians; her sect was exterminated soon after her death in A.D. 1321. A Lombard enthusiast, Wilhelmina 'of Bohemia,' claimed to be an incarnation of the Spirit to save the Jews, Saracens, and false Christians; her sect was exterminated soon after her death in A.D. 1321. In Thuringia, A.D. 1360, from the midst of the Flagellants (q.v.) came Conrad Schmid, an incarnation of Enoch, who founded the Brethren of the Cross; the Inquisition prevented the unfolding of a constructive programme. Among the Taborites, prophets appeared who foretold the speedy end of the age, and incited to war in order to clear the way for the reign of Christ. This intensified the resolve of the authorities to nip all such movements in the bud, and they burned Hans Döhn, who in A.D. 1476 claimed a commission from the Virgin Mary. Savonarola's claims to angelic visions won him great popularity, till he flitched from the demands of his admirers and his order of fire. The Alumbados of Spain, professedly holding intercourse with the Lord and with the Virgin, were equally put down; even Teresa of Castle was viewed askance, and her writings were severely censured. But their influence was more than a practical religion, more than with theology, and side with the Counter-Reformation.
ENTHUSIASTS (Religious) 319

the last propaganda work from Münster was Rothmann's book, *A wholly consolatory Witness of the Voice of the Living God in the Christian Ages*, etc. Early in the New Year, King Jan issued a code of law, closing with the claim, 'The voice of the living God has instructed me that this is a command of the All Highest.' To the end, he was believed in and obeyed; but the city was captured, and all the inhabitants were massacred. So closed the most remarkable of all the medieval Enthusiastic movements.

The whole movement did not die out at once, for ten years later Calvin published a tract Against the fanatical and furious Sect of the Libertines who call themselves Spiritual. His version was that they deemed themselves appointed to usher in the last dispensation, that of Elijah or the Spirit, when every Christian should have direct revelation, and the dead letter of Scripture would be discarded to have a double meaning. Calvin also accused them of teaching that there was no outward law and no principle of evil, for every believer was identified with God.

8. More lasting was the movement inaugurated by Jan van Riezen, 1169-1640. He had hitherto been a Roman Catholic; at Amsterdam he had met Anabaptists and declined to associate with them; but he now received a revelation to establish Emden as a prophetic, and publish three Divine communications: 'For this purpose have I borne thee on My heart from thy youth, for a house for Me to dwell in.' For twenty years he carried on a quiet propaganda with three compeers, constantly pointed out to him, Daniel, Elidad, and Tobias; then he was driven out, and worked in England and up to Cologne. A fourth revelation came in 1565, largely concerned with the organization of his followers; but it led to their doubting his inspiration. Apart from a most elaborate framework for the Family of Love, and a decided opposition to Lutheranism, the chief peculiar theological tenet was that 'there are some now living which do fulfill the law in all points.' Niclaes died in 1579, leaving no prophetic successor, but in 1606 the English adherents appealed to King James for toleration, repudiating all sympathies with the Puritans, insisting that they valued the Scriptures and believed in salvation through Christ Jesus the only Saviour, on repentance and newness of life. Two years later, Henry Argent, an Anabaptist, attempted to refute the *Epistle to Two Daughters* of Warwick. Yet they held on, only disappearing after 1645, when an outburst of new revelations attracted Englishmen susceptible to such influences, and left the Family of Love to wither away. There seems to be no more recent study than F. Lippold's, in *Zeitschr. f. d. hist. Theol.*, Gotha, 1892.

9. Britain was slower than the Continent to evolve prophets, but about 1633 Arise Evans began his career with warnings to King Charles that he and the kingdom were doomed. For a second message, two years later, he was imprisoned. When the Civil War broke out, he received a revelation to uphold the Established Church, and therefore attacked the General Baptists; they challenged his inspiration, and he offered a prophetic vindication to be repeated in a written work. He was not yet confirmed in his, and he continued to admonish the ruling powers, but met no acceptance.

10. Another isolated prophetess was Anna Trappel, who worked on her career about 1573, and joined the Anabaptists. She proved herself active in 1650. After the dissolution of the Nominated Parliament, three books of her prophecies were speedily published, and for a year before the death of Cromwell she was again active. She went into trances, and spoke in rude rhyme so fast that she could hardly be reported, calling herself the poor Instrument, or the Voice. The burden of the new teaching was that Christ would return and reign as the 35 times were fulfilled. No organization resulted from her work. The most recent study of her is in the *English Historical Review* for July 1911. More successful were the Muggeltonians, and, a century later, the Southcottians; for these see the separate articles.

11. Meantime fresh prophets arose on the Continent. J. W. Petersen, a Lutheran dignitary, devoted himself to apocalyptic interpretations, and, with his wife and another lady, announced new revelations, which seem to have contained nothing fresh except the modification of a dogma of Hoffmann, that Christ had a double human nature—one eternal, the other originating with the Virgin. Though Petersen spent half a long life publishing, his death in 1727 showed that no effect had been produced; and equally unimportant were other prophets, from the German artistic class. Two Hermits who professed to be the Two Witnesses, and in their teachings revived the Gnostic idea that, while the soul was regenerated, the doings of the body did not influence the judgment of the soul. For all these, consult Hagenbach, *Hist. of the Church in the 18th Century* (Eng. tr., N. Y. 1869).

12. In Russia an old inheritance from the Paulicians of Armenia first reappeared, and the sect is the Khlysti (Flagellants), followers of a man who in 1645 proclaimed: 'I am the God announced by the prophets, come down on earth the second time for the salvation of the human race, and there is no God but Me.' They held, however, that a succession of Christs has been maintained ever since, elevation to this rank being by perfect surrender to the influence of the Spirit, who subdues the flesh. Their prophets produce much prophesying, and, as they are expressly forbidden to write, lest inspiration be tampered with, they have made no permanent addition to dogma. As a reaction from them, about 1770, arose the Skoptsi ('Castrators'), founded by one who declared himself God incarnate: they are strongly chiliasm, and look for the return of Christ when their number reaches 144,000; the sealing into this number consists of castrations. For these and similar sects, see Leroy-Beaulieu, *Empire of the Tears* (Eng. tr., N. Y. 1893-5, vol. ii.), The most important of the movements in central and north Europe are the Shakers and the Muggeltonians, both of whom have spread beyond the country of origin (see separate articles).

13. The Convulsionist outgrowth of the Jansenists at Paris left no mark in theology; nor is it otherwise with the Covenants Prophets (see CAMISARDS). But the latter are responsible for the Manchester movement of the Wardleys, and Ann Lee, 'Bride of the Lamb,' who migrated to America and founded the Shakers (q. v.). These are not to be confounded with an English body founded in 1864 by Mary Anne Gilting, who gave herself out as the final revelation of God. Her teachings dealt chiefly with conduct, inculcating celibacy and communism. The most singular dogma was her own immortality, and her death in 1886 ruined these second Shakers, who had styled themselves 'Children of God'. About the same time the 'New and Latter House of Israel' was organized in Kent by James White, whose revelations are published in the *Flying Roll*. The most remarkable point is that Christ redeemed souls only to a limited extent; bodies underwent a period before the appearance of the Mosaic Law, and at Christ's appearing, 144,000 of these will greet Him and reign with Him. An enormous unfinished building near Gillingham is the chief relic of these Jereselites. More lasting has been the Catholic Apostolic Church (see
ENTHUSIASTS (Religious), springing out of a movement at Port Glasgow in 1829; while the proceedings of Prince and Smyth-Pigott have not yet destroyed the Socinian Agapeonome (q.v.). Far more influential recent enthusiasts are the followers of two remarkable Americans, Joseph Smith and Mary Baker Glover Eddy, for which see articles MONISM and CHRISTIAN SCIENCE, though the latter does not emphasize the point that the system came by revelation; as to which see Science and Health, p. 34, line 7; p. 109, line 20; p. 125, line 19.

(America has also been the home of other enthusiasts besides those just mentioned. The Amana Society (q.v.) is of German provenance, but the very small sect of Angel Dancers (q.v.) is purely American in origin, and, despite its evanescent character, it is not without interest psychologically as illustrating the rise of a sect based entirely upon enthusiasm. Ballou's curious 'American Bible,' Ourhope (q.v.) will be considered in a separate article on theology. In the Eastern States, the activity of Andrew Jackson Davis, the 'Poughkeepsie Sage,' whose Principles of Nature, Her Divine Revelation, and a Voice to Mankind, published in 1845, marks the foundation of Spiritualism (q.v.) as a separate cult, must be considered as outside the realm of Christianity, though Jackson was not, like Ballou, directly hostile to it. He claimed to have received his inspiration, during a trance of sixteen hours, from inhabitants of the other world, and alleged communications from the departed spirits form a leading feature in all spiritualistic sciences. Within the sphere of Christianity mention should first be made of Mrs. Ellen G. White, the wife of James White already mentioned. She was bom in Portland, Maine, in 1827. Before her marriage, in 1846, she began to have 'visions,' at some of the phenomena manifested by her clearly being attributable to hysteria. To her was due in great part the rise of the sect of Seventh-Day Adventists, who in the earlier days believed her to possess the gift of prophecy, and who have always maintained that she received 'messages of instruction for the Church from time to time by the direct inspiration of the Holy Spirit.' The extent to which this sect holds this belief is shown by the fact that in 1863 a sub-sect, the Church of God (Adventist), was formed on the single new tenet of rejection of acknowledgment of Mrs. White's alleged inspiration. A still more remarkable phenomenon is afforded by the creation of the Church of the India Chosen in England by John Alexander Dowdie (1847-1907), a Scotsman by birth. He was for some years a Congregational minister in Australia; but at Melbourne, where he had established an 'independent' church, he became a believer in Divine healing through prayer. For several years he inculcated these tenets in the United States and Canada, and, finally, in 1896, he organized his new sect, assuming the title of 'prophet.' He was 'first Apostle' of his sect.

To the number of American enthusiasts must be reckoned Frank W. Sanford (b. at Bowdoin, Maine, 1802), who was for several years a Free Baptist minister in New England. At a convention of his denomination in 1855 he announced that he had received Divine revelations commanding him to preach to the whole world before the coming of the end. He accordingly founded at Shutesbury, the Holy Church of the United States, which holds most pronounced chiliasmic views, while Sanford himself claims to be Elijah. After having conducted a disastrous voyage to Africa, during which a number of his followers died from insufficient food and care, Sanford was convicted, 9 Dec., 1911, of causing the death of six of these persons, and was confined in a Government prison. A single case of this kind in the court is of psychological interest in this connexion:

'I said: 'Father, what next? What next, now that we have this company on board?" I received this answer — and I make this statement advisedly, knowing what I am doing — I received this answer: 'Continue.'

In the latter part of 1896 yet another enthusiastic sect sprang into existence, the Church of God and Saints of Christ (popularly known as 'Black Jews'). The founder was William S. Crowdy, a negro who had been a railway cook until he received a revelation as 'a prophet of God sent to the whole world.' The new sect for a time made a profound impression on the negroes who attended its services, where even the local preachers were termed 'prophets.' The 'bishop', or 'prophet' (at present Crowdy himself), 'is not elected, but holds his position by virtue of a divine call. He has received divine visions and other manifestations from the Deity, to utter prophecies by the will of God, and to perform miracles. On his death the prophetic office lapses until a new vision appears' (Special Census Report [1906], Religious Bodies, ii. 292, Washington, 1910.)

14. All the Enthusiasts yet mentioned arose in a Christian setting. In the second half of the 19th cent., however, another development is to be noted. In the late 1850's and early 1860's there was an upsurge of interest in Spiritualism in England, followed by the emergence of the American Theosophical movement in 1875, which has persisted until the present day. Its adherents believe that the Christian revelation was only a first approximation to the truth, and hold that the spirit of Jesus still lives and works in the world, though in a hidden way. The Theosophical Society, of which H.P. Blavatsky was the leading spirit, was founded in 1875. The teachings of this movement have been much criticized, both for their gullibility and for their influence on other spiritualistic movements. In the 1890's, for example, there was a revival of interest in Spiritualism in America, and a number of sects and movements were founded. The most notable of these was the Spiritualist Church of the United States, founded in 1899 by William S. Crowdy, a negro railway cook. Crowdy claimed to have received a revelation as 'a prophet of God sent to the whole world,' and his followers were known as 'Black Jews.' They were especially popular in the South, where they believed that the Messiah would soon appear, and that the Jews would be restored to their land. The movement declined in the early 20th century, but it has persisted to the present day.
ENVIRONMENT (Biological)

authorized edition within three years of his death, and a revised Qur'an sixteen years later has proved final for the Sunnite sect, now the most influential. The transliteration of the Qur'an to the Arabic alphabet, in which the views of hereditary right were common, produced a schism soon after the Prophet's death, and the Shi'ites are legitimists not only in politics but in theology, holding that the hereditary succession of Muhammad is inspired. Three times this has had important results, with the Sufis, the Assassins, and the Babis (qq.v.).

W. T. WHITLEY.

ENVIRONMENT (Biological).—For the biologist the problems raised by the term 'environment' are largely concerned with the part this factor or collection of factors may play in the process of evolutionary change. To what extent can the changes of breeding among individuals in the conditions under which they live; and, if such changes occur, how far can they become permanent? That a definite change in the nature of the environment—temperature, moisture, food supply, or some other factor—will frequently bring about a change in the organism is beyond dispute. But whether the impress left on the organism can be transmitted to the next generation—whether so-called 'acquired characters' can be inherited—has been, and still is, a subject of keen controversy.

In his theory of evolution, put forward in 1809, Lamarck laid it down as one of his laws that the former production of any change in the environment during the life of the organism and corresponding transmission to the offspring; and during the next half century, in so far as the doctrine of evolution was accepted, it was accepted on this basis. By the publication of his Origin of Species in 1859, Darwin introduced another factor to account for evolutionary change, and the acceptance of 'natural selection' released the evolutionist from the burden of ascribing all specific differences to the direct action of the environment on the living thing. Darwin, however, remained to some extent a follower of Lamarck. Without variations upon which to work, natural selection cannot be effective in producing evolutionary change. As to the origin of such variations he did not venture upon any general statement, holding that in some cases they might be brought about by the direct action of a changed environment, and in others they must be attributed to some innate tendency on the part of the organism to vary, due to causes of which we are quite ignorant. Nevertheless, he did use one among his followers. Having once again to state his opinion, that a change in the conditions of life led to modification through the increased use or disuse of certain parts or organs, and that these modifications were accentuated and gradually rendered permanent through a continuous process of selection.

As an example may be taken the relatively smaller size of the wing structures, with their lessened powers of flight, in domesticated fowls, rats, and pigeons, which Darwin considered to have been directly initiated through the effects of disuse consequent upon a change of environment, and ultimately exaggerated and fixed by long-continued selection.

As compared with Lamarck on the one hand, and most modern biologists on the other, Darwin may be said to have held an intermediate position. For Lamarck the increased use or disuse of organs consequent upon a changed environment was the only source of variation, and therefore the sole factor in the transformation of species. For Darwin there were two classes of heritable variation—variations arising through increased use or disuse, and variations arising spontaneously in the organism through causes not understood, though in either case the co-operation of natural selection was necessary to bring about a permanent change in form. Cf. art. EVOLUTION (Biological).

More recently the tendency among biologists has been to define the term 'modification acquired by the individual through change of environment during its lifetime. This was largely brought about through the teaching of Weismann, who introduced a new conception of the relation of the reproductive tissues to the rest of the body. Hitherto this relation had been regarded as an alternating one. The germ-cells gave rise to the individual, and the individual in turn produced the germ-cells. Weismann introduced the idea of the continuity of the germ plasm through successive generations, and regarded the body, or soma, as an offshoot specialized for carrying and protecting the all-important germ plasm. By its formation the body is, as it were, side-tracked off the main course of evolution. Its chief function is that of a trustee for the germ plasm which it contains. Moreover, the germ plasm carried by a given body belongs to the same generation as the body itself, and is of equal age, both being the direct offshoot of the germ plasms carried in the bodies of the common parents. It is obvious that this conception of the relation between an individual and its contained reproductive tissue renders it difficult to conceive how a modification brought about by an environmental change in the latter can induce such a change in the former that, when it comes to a somatic offshoot, it will convey to it the impress of a modification just produced in a group of cells in which it lived but from which it was not derived. Weismann, therefore, challenged the evidence for the supposed transmission of 'acquired' characters, and showed that when critically examined it broke down. He also brought forward direct experimental evidence against the transmissibility of a definite group of acquired characters, and showed, from a long series of experiments on mice, that mutilations are not in the least degree inherited.

Nevertheless, heritable variations are continually arising in animals and plants, and it is in the fact of such variations that Weismann's views differed from those earlier current. For Weismann, the germ plasm transmits heritable variation in the germ plasm, and not in the soma by which the germ plasm was carried. Any new variation first arises through some abnormal occurrence in the germ plasm. It has not benefited from its own existence, and it is expressed in each of the sequence of somatic offshoots to which that germ plasm gives rise. Fresh variations can, on Weismann's view, be directly due to an environmental

1 For the ethical aspects, see Edocatio (Moralis), p. 216, and Ethics (Radnitzky), p. 429.

VOL. V.—21
The action of a changed environment on a living thing may induce a change either in the soma or in the germ plasm. But, even if both are affected, it does not necessarily follow that the changes are corresponding ones. The change in the germ plasm can, of course, be appreciated only if its formation is accompanied by a somatoplasm change, and this may present modifications differing from those shown by the antecedent soma, though the modifications in each case may have been brought about by the same environmental change. In the one case the change acts directly upon the somatoplasm, in the other it acts upon the germ plasm which transmits the effects of the stimulus to the soma that subsequently arises from it.

Discussions on the transmission of environmental changes frequently arise out of cases in which the developing young, as in mammals and plants, are parasite for a time upon the maternal parent. Decreased vigour may arise from unfavourable conditions of nutrition, often leading to an abnormal lack of vigour in the offspring, and this has sometimes been held to show that the direct effect of altered conditions on the parental organism is transmitted to the next generation. For example, two similar plants may be taken, of which one is grown under favourable, and the other under unfavourable, conditions. The seeds of both are collected and grown under similar conditions, and it is found that those derived from the latter plant give rise to less vigorous offspring than those derived from the former. In such cases it is as if a quality overlooked that the relation of the parent to the offspring is twofold. Not only does the parent carry the germ plasm from which the offspring arise, but at the same time it acts as the environment of the developing young. It is in the latter capacity that a modification in the parent following upon changed conditions brings about a modification in the offspring. The question is not one of the transmissibility of increased or decreased vigour from parent to offspring; it is simply a question of the direct effect of altered environment on the developing young.

Weissmann's views may be said to have met with general acceptance among biologists, though heretics, and indeed heathens, may be found in a few supporters of a somewhat modified form of Lamarckianism. Little further advance was made until the 20th cent., brought with it a fresh stimulus to experimental work on living things, and within the last few years the question of the inheritance of acquired characters has been re-opened, largely through the researches of Pzibram, Kammerer, and others. The experiments of the last-named were for the most part made with amphibia and reptiles, and are concerned principally with colour modifications or with modifications of the normal instincts resulting from a changed environment. In several such cases it is claimed that the modifications produced re-appear in the offspring even when they are reared under normal conditions. The possibility is not precluded that the germ plasm was altered simultaneously with, but independently of, the somatoplasm in the individuals used for experiment; and the results cannot be regarded as conclusive evidence for the transmission of acquired characters, unless it can be shown that they are reversible at will through the alteration of the environmental conditions. Though this has not yet been done, the experiments are full of suggestion, and there is reasonable hope that the work of the next decade will go far towards providing the answer to the old and much debated question of the inheritance of modification brought about by an alteration in the environment.

LITERATURE.—In addition to the writings of Lamarck and Charles Darwin, the following will be found useful to students: S. Butler, Life and Habit, London, 1877, also Evolution, Old and New, 1879; E. D. Cope, The Primary Factors of Life, 1874; H. H. Morgan, Experimental Zoology, London, 1897; A. Weissmann, The Germ Plasm (Eng. tr., 1903), also The Evolution Theory Theory of Enviroment. A succinct and illustrated account of the most recent experimental work is given in H. Przibram's Experimental Zoology, iii., 'Physogenesis,' Vienna, 1916. The most recent discussion from the Lamarckian standpoint will be found in R. Somon's Die Mamm., Leipzig, in the Fortniete der naturwissenschaft, Forschung, vol. ii., Vienna, 1911.

R. C. PUNNETT.

ENY AND EMULATION.—I. Envy.—Envy is an emotion that is essentially both selfish and malevolent. It is aimed at persons, and implies dislike of one who possesses what the envious man himself covets or desires, and a wish to harm him. Graspingness for self and ill-will lie at the basis of it. There is in it also a consciousness of inferiority to the person envied, and a chaining under this consciousness. He who has got what I envy is fitted to possess it of right, and I resent it. Consequently, I rejoice if he finds that his envied possession does not give him entire satisfaction—much more, if it actually entails on him dissatisfaction and pain. For instance, I see his superiors in my eyes, and ministers to my feeling of self-importance. As signifying in the envious man a want that is ungratified, and as pointing to a sense of impotence inasmuch as he lacks the sense of power which possession of the desired object would give him, envy is in itself a painful emotion, although it is associated with pleasure when misfortune befalls the object of it. As Dryden says:—

"Envy, that does with misery reside,

The joy and the revenge of ruin'd pride."
Great poets, like Shakespeare, know well how to represent this emotion in its nature, play, and offensiveness (see, e.g., Othello and Winter Night's Tale), and they mark its outward expression also, and elucidate it by similes. Says Chaucer, in "The Knight's Tale":

"Therewith the rage of jealousie spystete
When she him by the wriste, and by the herte
So woody, that he lyk was to bide the bote;
The bostree, or the ashen, dide and died the".

Jealousy seems to present some degree in the lower animals, as well as in man.

A favourite dog will be emotionally moved by the sight of its master fondling a kitten or another dog, but he sometimes danger him and last, as he will keep pushing himself forward to be caressed, with edifying glances at the kitten. Some very young children behave in a similar way when their mother nurses another child. And it was both cases the jealousy creature is apt, to exhibit anger towards the intruder (W. Mcnagall, "Intro. to Social Psychology", p. 129).

2. Emulation.—Very different from envy, though often taken as synonymous with it, is emulation. The latter is not, properly speaking, either selfish or unselfish, and it is not of the essence of it to be associated with hatred. It is characterized more by contrasts with envy than by similarities. It is an exhilarating emotion, drawing forth and strengthening the individual's capacity for action and achievement. Emulation, indeed, is, and has to be classed under the natural desire of superiority or power, but it is not selfish; it is compatible with generosity of character and good-will, which neither envy nor jealousy is. It stimulates the growth of the individual who is the object of the emulation, and invigorates our nature; and by the fact that there is in it an element of uncertainty (if not of hazard), it adds to the zest of life, as pursuit and enterprise in general do.

The emotion seems not to be confined to man, but is shared by the lower animals, as we see in the competition in racing between horses and the like; and it is intense in children, entering into many of their games.

Emulation must not be confused with ambition (q.v.). Ambition, too, reposes on the love of power, and, when nobly directed, is a valuable and laudable impulse. Having great things is simply an eager desire with effort to actualize it to rise in place or to increase in influence; and so far it is good. "To take a Soldier without Ambition," says Bacon, "is (to pull off his spurs" (Essays, "Of Ambition"). But if, as Plato represents it in the Republic, it be the dominance of the will over the reason, then it is inordinate desire, and is ready to make a wrong use of rivals or those that stand in the way, ignoring the fact that every man is an end in himself, and must not be treated simply as a tool. The ambitious man, we often say, has no conscience: at any rate, his conscience is subordinated to his own purpose, and he is entirely indifferent to rectitude. It is not well with us when our principle becomes, 'I must rise, whoever falls, and whatever be the means.'

"The evil consequences of ambition on character have been the theme of preachers and poets alike through the ages: 'by that sinne fell the Angels' (King Henry VIII., III. ii. 440).

3. Emulation degenerated.—Distinct though emulation is, there is an inordinate and self-seeking quality in the other. It is manly and proper to wish to excel in a race, and to strain every nerve to accomplish that end; but, when the runner, finding himself likely to be outstripped by his opponent, tries to outstrip him or to trip him up, that is emulation degraded to envy: honourable rivalry has been replaced by conduct that is dishonorable and mean.

"Emulation," says Butler (Serm. i. note 30), "is merely the desire and hope of equality with, or superiority over, others, with whom we compare ourselves, ... To desire the attainment of this equality or superiority is nothing amiss; but when the means are being brought down to our own level, or below it, it, I think, is the distinct notion which I mean. From whence we do not take the real end, which the natural passion emulation, and which the painful one envy, aim at is exactly the same; namely, that equality or superiority and consequent satisfaction. In truth envy is not the end of envy, but merely the means it makes use of to attain its end."

The lapse into envy brings its own nemesis. The envy of the envious man reacts upon himself: it is apt to bring him more pain than pleasure—as the common phrase has it, it 'gnaws his soul.'

4. Implication of society.—It only remains to add that the motions here considered—envy and jealousy, emulation and ambition—presuppose society; i.e., they could not exist except in a social environment or setting. They are essentially egoistic, insomuch as they centre in the self or ego, being concerned primarily with the individual's interest; but they are conditioned for their existence by the fact that there is an 'other' over against the individual, competing with him and possessing different and, it may be, antagonistic interests. They all imply relations to other human beings, and the conception of a pure 'individual'—of an isolated organism unit, absolutely divorced from every other conscious unit—is an absurdity: egoism (q.v.), in that sense, can be none.

Epictetus.—Epictetus (fl. c. a.d. 50-139) was a distinguished pupil of the Roman philosopher Musonius. Though not possessed of the originality or daring of his teacher, he has attained much greater fame through the fact that the substance of a great number of his discourses was preserved and published by his pupil Arrian. From the date of their first publication down to the present day these 'discourses of Epictetus' have enjoyed an extraordinary popularity; they have been many times translated into various European languages; and they constitute an authority of the first importance, both as to the teaching of the Stoic philosophy which Epictetus professed, and as to the social atmosphere of Rome in the 1st cent. A.D.

Epictetus was brought up as a slave in the house of Epaphroditus, a freedman of Nero, and presumably the same who became his secretary, remained faithful to him upon his fall, assisted him in his last hours, and was afterwards put to death by Domitian. Epaphroditus, a native of Cyprus, used to bring the slave, gave him the liberal education which was at that time the privilege of the humblest members of the great Roman household, and sent him as a young man to study under Musonius. He then
gave him his freedom, and Epicetus took up work on the philosophy of another popular philosopher. Young men from all parts of the Empire listened to his teaching, and men of rank and position sought his advice. In the year A.D. 89 he fell a victim to the edict against the philosophers, and was exiled from Rome and Italy; he withdrew to Nicopolis, and lectured there till his death in a ripe old age. The Emperor Trajan held him in special honour, and the records of his teaching is an important source of information. He had an influence on the youth of Marcus Aurelius.

Epicetus was well schooled in the orthodox teaching of the Stoic philosophy, and it has been shown that both in his principles and in his use of technical language he is loyal to it. It is, however, only with difficulty and by a careful rearrangement, of the material that a philosophical system can be deduced from his recorded utterances. Each of these is complete in itself, and it serves as its direct appeal to the conscience of his hearers. Thus the practical application of ethics outweighs all other parts of the philosophy, and, while there is constant repetition within this field, the rest of the system is only hinted at by casual allusions. The ethical principles of Epicetus are strongly coloured by the circumstances of the time. He argues that a political and personal freedom may be wanting, no man can be deprived of true freedom, which consists in pursuing virtue, the only good. Fortune has no power over the philosopher, because the things that she can give and take away are indifferent. The exercise of virtue consists in attention to the homely duties which result from human relationships, such as those of master and slave, parent and child, magistrate and citizen. In all his work, those qualities are fostered by the nearness of God, whose will he gladly obeys, and to whose decrees he is resigned. Epicetus holds up to our admiration the picture of the ideal Cynic, who, disdaining home or comfort for himself, becomes the servant of all, and enters every family to reconcile or to console; but he avoids the paradoxes in which the early Stoics and Cynics alike delighted, is gentle and reasonable in his teaching, and seldom engages in sharp controversy. He asserts his personal convictions most definitely in an uncompromising denial of the doctrine (towards which his hearers were strongly inclined) of the continuance of personality after death.

The discourses of Epicetus are so often considered typical of Stoicism that it is necessary to observe that he was Stoic with a difference. In temperment he had little in common with Zeno and Cleanthes, who were enthusiasts and revolutionaries; and hardly more with Panatius and the middle Stoics, who were gentlemen and statesmen. Epicetus, even when his position was the highest, was at heart a slave; his talents lay at the disposition of others. He accepted Stoicism at command; and in the same spirit he accepted the teaching. He held to its circumstances of his time. No man could be more precise in insisting upon the regular and contented performance of all actions approved by the general opinion; around these he threw the glow of a religious enthusiasm, which certainly enabled him to do wrong at the bidding of any earthly master, but at the same time predisposed him to consider as right any burden that others might lay upon him. Dionysius was undoubtedly anxious of ever having imagined that political danger could arise from such a philosopher.

The study of the discourses of Epicetus is an indispensable starting-point for true understanding of the teaching of St. Paul. Better than any work of antiquity they reveal to us the inner thoughts of the social circles to which the Apostle chiefly addressed himself. See, further, art. Stoicism.

E. V. ARNOLD.
show their great variety. Many were scientific treatises, some physical (περὶ φυσικῶν καὶ καταφυσικῶν ἱδιωτεύματα, τῇ τρίτῃ, τῇ τέταρτῃ, τῇ πέντῃ ἱδιωτεύματι, τῇ πρώτῃ ἱδιωτεύματι), others ethical (περὶ αἰρέσεων, περὶ μετάφρασεων, περὶ δικαιοσύνης καὶ τῶν ἀλλῶν ἀρτικῶν, περὶ ἰδιώτου, περὶ γραφείου, περὶ τίτουλων), and one, the famous Κάρτων, dealt with the standards of truth in scientific treatises. Another, the standard treatise of Epicurus, was an attempt to explain and refute other than Epicurean tenets; e.g., the doctrine of 

### 2. The School

Our authorities are unanimous that there never was a more united school. The doctrine of the founder was passed on unaltered, and it is difficult to detect any material divergence from orthodoxy in the expositions of succeeding ages. Of the immediate disciples, three, Metrodorus (330-277 B.C.), Polyaenus, and Hermarchus, were not joined with Epicurus as the four pillars or standards of orthodoxy. Polyaenus had been an eminent mathematician; and Metrodorus had been a master in rhetoric; Leucippus had been a master in the art of speaking; but Epicurus, except once to spend six months at his old home, was the favourite and the most gifted. We have a list of fourteen works by Epicurus adduced from his disciples' letters of all last equal authority with the master's own. Several of them appear from the titles to have been controversial works; for even Metrodorus found his scientific activity limited by the very completeness and finality of the system which in his own time was committed to the master was incompatible with free inquiry, and in all succeeding generations Epicurus who wrote on philosophy at all were brought under the necessity of restating, or to expose and refute those who did not accept them. Metronius had a brother Timarchus. He was appointed to success which he refused, and then abandoned the faith—almost the only instance of a renegade in the annals of the school. It was a political opposition against this heresy which led him to write a long tract, a résumé of which is the standard of all that pertains to man's well-being—almost the only instance of which the enemies of the school were not slow to take advantage.

From Hermaprion, who succeeded Epicurus, the headship of the school passed to Metrodorus, who died in 277 B.C., and from him it passed to Metrodorus—first, and next to Baisidius; and then in unbroken succession for several centuries, though our information is so scanty that many of the names are to us known to nothing.

About 100 B.C. Zeno of Sidon, who is mentioned by Cicero, succeeded Apollonius (6 ephemerides), who was the author of some 400 treatises. Zeno was followed by Philostratus, whose successor, Patroclus, was head from 73 until after 50 B.C. But the most conspicuous Epicurean in the Roman society of that day was Philodemus of Gadara, tutor and guest of Piso, the consul of 67 B.C. His poetical skill is admitted by Cicero (in Pis. 32), and over thirty of his epigrams are included in the Anthologia Palatina. He was also a prolific prose writer; the Library of an Epicurean at Herculaneum contained works by him—περὶ συντάξεως, περὶ μετάφρασεως, περὶ ποιημάτων, περὶ τεχνείων, περὶ σωτηρίας, περὶ θεωρήσεως, περὶ εἰρήνης, περὶ συγγραφής, περὶ ἀθέσεως. From him it passed to Psuetus and on to Sallust, and then in unbroken succession for several centuries, though our information is so scanty that we know nothing of the names.

3. Philosophy and its divisions. As a child of his age, Epicurus emphasized the importance of conduct, defining philosophy as 'a daily business of speaking and thought to ensure a happy life.' The loss of national independence and the decay of civic life are often alleged as causes why the later Greek philosophy became more and more practical, and the later Epicureanism became more and more prosaic; but this change of direction had set in long before, with the Sophists and the Stoics. The older physicists sought knowledge for its own sake; Epicurus and his school sought it as a means to happiness.

If we had never been molested by alarms at celestial and atmospheric phenomena, he says, 'or by the misgivings that death somehow affects us, or by neglect of the proper limits of pains and desires, we should have had no need to study natural science' (Diog. Laert. x. 145). And again, 'Vain is the discourse of that philosopher by whom no human suffering is heeded' (Porphyry, ad Marcellum, xxxv. p. 200, 23 [Nanke], br. 221 [Cicero]). By these and similar utterances he attests the predominance of the practical aim, and by implication places some limitations to the theoretical part of physical inquiry. We must study Nature because we ourselves are part of it, and, until we have gained some acquaintance with the whole, we shall neither understand our relations to it, or learn what conditions our happiness, or avoid the prosecution; but this change of direction had set in long before, with the Sophists and the Stoics. The older physicists sought knowledge for its own sake; Epicurus and his school sought it as a means to happiness.
Democritus (q.e.), to whom he stands in much the same relation as the Atomists to Heraclitus. To him the value of the discoveries of the Atomists lies in their utility; they free us from the errors of popular belief and false philosophy. Thus they are directly subversive to a hasty life. Philosophy had been divided into Logic, Physics, and Ethics; but the great mass of logical doctrine was rejected by Epicurus as superfluous. Like men of science in more recent times, he wished to concern himself not with words but with things. However, besides Physics and Ethics, he recognized what he called Canonie, a study of the standard, or canon, of truth. The aim of this study was to convince us that our knowledge of Nature is trustworthy. It was not so much an independent division of the system as—what it is sometimes called—an appendix or special part of Physics (accessio naturalis partis, [Sen. Ep. 89, 11]).

4. Physics.—(a) General principles.—The two epistles mentioned above, the epistle to Herodotus and that to Pythocles, are the most trustworthy sources for Epicurean physics. Like all his Ionic predecessors, he makes his axiom that matter is indestructible. Nothing can arise out of that which is not; nothing which actually exists can be altogether annihilated. Moreover, the sum-total of things was always such as it is not now, and can never be. For there remains nothing into which it can change, since outside the sum of things there is nothing that could enter into it and bring about the change. The whole of being, then, consists of bodies and space. Experience through sense attests the existence of bodies, and without sense (τέτοιον) which we also call an intangible existence (δείκτης φαινεται), vacuum (εύκολον), or room (φέρεσιν)—the motion of bodies, which is so imperceptible, is seemingly conceivable. Beyond bodies and space there is nothing—no tertium quid—which can be conceived to exist, so long, that is, as we fix our attention upon wholes or separate things, in contradistinction to the qualities, whether essential or accidental, which belong to things. But a distinction must be drawn between those bodies which are composite and those which are simple. The former are unions of particles—unions which can be again dissolved; the latter, the particles of matter themselves, must be unchangeable and indivisible (hence their name, ἄρτιος, ἄρτσας). All apparent differences have to be reconstructed, the alternate uniting and separating of such ultimate indestructible particles. The All, or sum of things, is by its very notion infinite. For, if finite, it must be bounded by a something outside it, which is inconsistent with the notion of the All. It is infinite, not only spatially, but in respect of the number of indivisible particles or atoms contained in it; for, if space were infinite and bodies finite, they would not have stayed anywhere, but have been dispersed and lost in the void; whereas, if space were finite, it could not find room for infinite matter. The atoms resist dissipation because they are all matter; they contain no void within them. In Lucrertian language, they are strong in solid singleness. They vary in shape; the atoms of each shape are absolutely infinite, but the variety of shapes, through being added to the single, is limited by the limits of the infinite. The atoms are eternally in motion, rebounding after collision, or again oscillating when imprisoned in a mass with other atoms which temporarily form a bounded thing. This is because every atom is in void space, where it has no resistance; and there was no beginning to all these motions, because both matter and space are infinite. Hence, too, there must be an infinity of worlds—some like this of ours, others unlike it. A world is defined (88), after Leucippus, as a sort of envelope of sky enclosing an earth and stars and all visible things, which is cut off from the infinite, and terminates in a boundary which may revolve or be at rest, which may be round or triangular, or of any shape whatever.

After thus laying down the principles of matter and motion, Epicurus proceeds to deal with the films (ἐνδώματα) which emanate from bodies, by which he, like Democritus, explained perceptions of external objects, and the activity of sense. Such husks of films are incessantly streaming from the surface of all perceptible bodies, the waste being as constantly repaired by the accession of fresh atoms from the infinite store of matter. Their velocity through space is enormous, if they encounter no resistance; and, so long as this is the case, they preserve the relative shape, with projections and depressions, of that object from which they were parted. This degree of resemblance entitles them to be called images, in spite of their lack of depth. Our sensations of seeing, hearing, and smelling depend upon the entrance of these films into the sense organs. Our belief in the permanence of visible external objects is due to the constant succession of images of the same shape and colour which reach us from them. And, as with the eyes, so with the mind. The mental perceptions, which arise in intuitive thought, is due to the impact of the ἐνδώματα upon the finer substance of the mind. But not all the films which strike upon the senses or the mind reach us unimpaired. In the course of their passage the outlines may have been blurred, distorted, or mutilated. Further, in the air atomic structures may arise which never formed the superficial layer of any actual body, e.g., a Centaur, and these, concealing the causes or the mind, give rise to erroneous judgments.

(b) Canonie.—At this point the purely physical exposure naturally passes over into Canonie. In his treatment of the problem of truth and error, Epicurus inflexibly adheres to one main position: that perceptions of sense and mental intuitions are always true, and that error creeps in with judgment or opinion (δόξα). Judgment undertakes to interpret sensation. If we want to test the truth of a judgment about an external object, we compare the sensations which we receive in succession from it. If, then, the earlier interpretation is confirmed by an independent observation, the judgment was true; if, however, it be not so confirmed (καὶ τὸ ἐναμπερτρύπῃ), the judgment was false, as when the tower which seemed round at a distance is discovered on a nearer approach to be square. This is a case where subsequent examination is possible (ὦ προσεμετρεῖ; but many judgments deal with the unknown (ἀνάθρω), about which we draw inferences from the known. Here the ἐνδώματα, which cannot be directly perceived, must be made the subject of an inference by connecting it with another object which can be perceived. There are also cases, within the region of known and knowable fact, where, owing to circumstances, the test of sensation cannot be directly applied a second time. Where for any of these reasons further confirmation (ἐνωφαρτήριον) is inapplicable, Epicurus falls back upon a feasible infinitely small experience: e.g., of ἔναν ἀριττήριον ἐκ τῆς ἀκολούθου ἀπὸ ἐνευμάθειας και διακαταλήπτου ἀνθρώπων τῆς φαινομενής ( Sext. Adv. Math. vii. 213, fr. 217 [Ueber]). The judgment upon its trial is secured by no fact (ἐναμπερτρύπῃ) or attachment to witness against it. Thus applied, the Canon allows the strangest hypotheses concerning atoms, images (ἐνδώματα), and gods to pass unchallenged. It should be noted also that the procedure by way of induction and analogy
presupposes something answering to a law of
uniformity—'as are the instances under our ob-
servation, so too are the instances inaccessible to
observation of the eyes. Epicurus deduces this
reason in this way: the imperceptible atoms and
their movements are construed as if, under the
microscope or some more potent aid, they could be
detected. At other points of view, the theory
differs. Somewhere in infinity all possibilities
are realized, for nothing in our experience
contradicts either this general proposition,
or particular cases inferred, such as the
arrangement of the world, or the alternative
explanations of celestial phenomena. A meditated tract
by Philodemus of Gadara on signs and inferences
(τεμ. σημεῖα ὡς καὶ σημειώσεως) is a proof that,
two centuries after the death of its founder, the school
was still interested in analogical and inductive
reasoning. Again, Epicurus laid down a criterion
for the practical as well as for the theoretical
sphere. This consisted in the peculiar sensations
of pleasure and pain, in which he recognized the
same clear evidence (σφηκία) which belongs to
perceptions of external objects (Diog. Laert. x. 34;
763 sqq. [cf. 391 Ussher]). The reason
is of the highest importance when he comes to
Ethics.

Besides immediate perception, and the feelings
of emotion, another main sense of a higher standard of true
judgments is to be found in preconception (προφθαλμός).
This term denotes primarily a notion based upon
and derived from perception, and therefore, like it,
valid, which has found expression in some common
terms (e.g. 'man'). The utterance of the
term calls up in those who understand
the language a clear and distinct mental image (προφήσις)
already formed from previous clear and distinct
perceptions. Sometimes, however, true judgments
so universally recognized as not to require further
testing by experience are also called preconceptions
(προφήσεις). In any case, both their validity as
tests of truth, and the mark of clearness and
distinctness which they present, must be of a
secondary and derivative kind, as compared with
sensation.

(c) The atoms.—Returning now (§ 54) to the
unchanged, Epicurus the atomist, Epicurus hence
deduces the distinction between primary and
secondary qualities long before announced by
Democritus (p.v.). All qualities (πράγματα) are
unchangeable; but the atoms must be thought of as
unchangeable, for all changes must have something
permanent underlying them. Hence the atoms
possess only weight, shape, and magnitude, to
which may be added impenetrability (διασωτικόν:
Sext. adv. Math. x. 240, fr. 275 [Ussher]).
They have not colour, smell, taste, heat, cold, dampness,
or dryness. These changeable qualities arise, not
in the atoms but in the composite wholes (συνήθρώματα)
through the varying union and arrangement of
atoms (ἐν τῇ ποικίλῃ συνέθρωσι ὑπὸ ἀτόμων συνών): Simp.
Catag. 14, fr. 288 [Ussher]. But, while Democritus
made the secondary qualities relative (πράγμα χρωμᾶτι,
μέγεθος, κ.ά.), Epicurus by his unshakable belief in
the reality of present sensation is bound to attribute
them to the composite objects or perceptible things.
The leaf is yellow, though its atoms have no colour,
for my sensation of yellowness upon seeing it is
real and objective, due to an image, of the same
colour as the leaf (διά μιμημάτων: Diog. Laert. x. 49,
p. 11 [Ussher]), which enters my eye. The whole
variety of changing qualities present in experience
can be attributed to the activity of the atoms, upon
account of the variety of atoms, if due account be
taken of variety in atomic arrangement and motion.
Another point of difference from Democritus is that,
whence he made
his atoms of all sizes, Epicurus objects to the
assumption as unnecessary for the explanation of
differences of quality, and as involving the absurdity
of imagining atoms. Nor, again, can any atom be
infinitely small, for no body of finite size can
contain an infinity of constituents, nor can sub-
division go on indefinitely, for then some part of
must be divided. Though the atom is the
least body separately existing, it has itself
minimal parts, which must be conceived on
the analogy of the corresponding minimal parts of
bodies of finite size. Such atoms, as he
matter, are conceived as made up of minimal parts
not further subdivisible. In infinite space all
bodies move with uniform velocity (σταθερᾷ [Diog.
Laert. x. 61]), so long as they encounter no resist-
ances, which is made to account for all variation in
velocity (βαρών ὑγρών ὑπὸ ῥωτίων καὶ σκόθων)
arboret: th. x. 46, p. 10 [Ussher].

The free atoms move with the swiftness of thought
over the very greatest distances, and this uniform
velocity is maintained, whether the atom falls
from above downwards under the influence of
weight, or recoils from collision with another
atom, or oscillates in the entangled mass of atoms
(ὁχυροτοίον ἑτεροτοιοῦν: Th. x. 61), which makes an
inductive motion due to weight presumes that up and
down are somehow empirically determined. Now, in
infinite space there can be no up or down in the
present sense, as it is not determined in which a
body cannot move. At the same time, the opposite
directions up and down, which we
distinguish in any line of finite length, remain
equally opposed when the line is prolonged to
infinity (εἰκότητα).

5. The soul.—The materialism of Epicurus is
prominent in his treatment of the soul. It is
a corporeal substance, a compound of atoms of four
different species, distributed throughout the frame,
but more densely massed in the breast. It most
resembles warm breath, i.e. wind mixed with heat.
Elsewhere it is said to contain air as distinct from
wind, and a fourth nameless substance which is
the seat of sensation, memory, love, hate, and
intellect in general (τῷ ὕπον ὑπὸ καὶ μνημοσύνῃς,
καὶ φιλία καὶ μικρία, καὶ διὸ τὸ φύσιμον καὶ λογοπάθε
ἐν τού ὕπον φυσικομαθίαν φυσικά τοιούτα θεωρεῖνοι: Plut.
nec. Cat. 20, p. 1158d, fr. 314 [Ussher].

Portions of this subtle substance may leave the
body, as in sleep, or through the effect of a deadly
blow, and yet the patient may recover, and receive
now accessional attendance. Its mobility is shown in thought, feeling, and the
bodily motions which it originates. The connexion
and mutual dependence of the two corporeal sub-
stances, soul and body, are conceived as follows:
We derive sensation, sentience, feeling, mainly
from soul, partly from body; for our soul
would not be sentient unless it were confined in our
body. Being so confined, it confers this quality on the
body, which it renders sentient; but the body
does not share in the other functions of the soul,
such as memory and thought. The peculiar
motions of the soul's substance, on which these
higher functions depend, are also conditioned by
the body which encloses and holds it together.
At death the lifeless corpse ceases to feel; but the
soul, too, can no longer retain sensation when
separate from the body, but is dispersed in air.

Essential attributes and accidents.—The
soul is not an incorporeal substance is proved by
the fact that it acts and is acted upon. There
is nothing incorporeal to Epicurus except empty
space. What exists is space, and what
exists, upon examination, to be, not an independent
thing, but an attribute or quality. And here
a distinction must be drawn between essential
attributes (ἐναξιόν), which are inseparable from (δε
the conception either of a body in general or of a visible body, and the fortuitous transitory states, or accidents (συμφέροματα), with which this is not the case. The former, Epicurus holds, are not incident to any corporeal, or incorporeal entities, or simply non-existent; in their entirety they constitute the permanent nature of the whole body, though not in the sense that they are parts of it spatially divisible (ζωές τὰ ἐν οἷς συμφέροματα)Diog. Laert. x. 69, p. 23 [Usener]. and are never perceived apart from it. As shape and size are qualities of body as such, which we cannot think away, so it is with single bodies: each has its inseparable essential attributes, which we cannot think away from it without annihilating its nature. Of accidents (συμφέροματα) the most important are motion and rest and, as motion and rest are related to corporeal things, so time in its turn is related to them. Hence time is properly defined as an accident of accidents (συμφέρομα συμφέροματων).

6. Human progress.—The infinity of worlds above and below, such as we sometimes fancied some had come to being, and others perish. The Epicurean cosmogony, which in the main follows the lines laid down by Democritus, is most exactly given by Lucretius, who writes that the destruction of worlds is the work of Divine agency, but both are merely a product of the eternal motion of atoms, of natural laws working independently of any plan or purpose. As with our world at large, so with human civilization. That, too, is a product of undesigned natural development. Activities originally exercised instinctively came, in course of time, to be matured and perfected by intellectual thought and thus all the arts of life were successively evolved. Intellect itself is a product of Nature, and, in long ages, has acquired, under the pressure of need, its whole store of knowledge and aptitudes. The origin of language had given rise to fierce discussion. Some sought it in Nature, others in convention. Epicurus does not wholly accept either view. He traced language back to those instinctive cries, expressive of emotion, which are as purely reflex as a sneeze or the bark of a dog; but he recognized that these cries would not be everywhere the same, but would vary in different tribes according to varying conditions. Out of these primitive words language gradually developed — the word, as he used to say, which has no meaning is used, but the word which has no meaning in a local dialect should be quite unmistakable, and intelligible throughout the whole tribe. The last terms to be invented were those, he thought, that the names of things which are not visible and corporeal. In other words, language is another case where the natural instinctive product was shaped under stress of necessity, and adapted to its purpose by human intellect.

7. Πετυχα.—The epistle to Herodotus ends with a brief summary of the principles regulating the attitude of Epicurus in regard to those natural phenomena which in all ages have excited curious and terrible, such as earthquakes, tempests, and the like. The general name for such phenomena is μετυχα, because, with the exception of earthquakes, they occur overhead in the sky. We are bound to believe, he says, that such things do not occur by the command of any being who enjoys bliss and immortality, i.e., they are not the work of the gods. Whether such Divine interference be conceived as perpetual, and the cause of regularity, or as spasmodic, and producing abnormal and irregular events, the care and anxiety implied by it is incompatible with our notion of perfect bliss, and the mere belief in such an inconsistency is enough to destroy the idea of any such interference. Our knowledge must indeed, depend upon accurate knowledge of the most important principles, and from that sphere of physics plurality of causes or contingency must be absolutely excluded. But exact knowledge of details does not contribute to happiness. Thus in astronomy we must learn what the heavenly bodies really are, or what they are not. For that Stoics are wrong in holding them to be orbs of fire, endowed with life, reason, and purpose; but, when we come to the phenomena of nature, such as comets and eclipses and the like, exact knowledge on these points is unnecessary to happiness, and, as a fact, does not relieve from terror and misgivings the experts who claim to possess it. Their curiosity can never be quite satisfied. Some things still remain unknown, and therefore excite no less alarm in the experts than in the ignorant multitude. If our researches into celestial phenomena lead us to assume, not a single definite cause, but a plurality of possible causes, each sufficient to account for the phenomenon in question, such a result is accurate enough for our purpose, which is to ensure our own peace of mind. In such investigation we must not carry the investigation any further. In the method worked is shown in detail in the epistle to Pythodorus. For each phenomenon several alternative explanations are set down side by side, and no preference is shown to any of these over the others. Many of them are known to have been put forward in all seriousness by one or other of the early Ionians—Anaximander, Anaximenes, Xenophanes, Anaxagoras, Metrodorus of Chios, and, of course, Democritus. Thus the document, properly used, has its value as a contribution to the history of Greek science. The industry with which all previous explanations are collected is creditable, and may be set off against the writer’s indifference as to which of them is true, so long as they dispense with the subsidiary assumption of Divine interference. Once, indeed, the record drops its habitual tone of impartial neutrality and takes sides with one of the writers. Herodotus had declared the size of the sun to be the breadth of a man’s foot (Diels, B 3 [P. 62]). Epicurus, ignoring the wide divergence of opinion upon this interesting problem, lays down a similar view (Diog. Laert. x. 91) respecting sun, moon, and stars, which are all alike stated to be, in relation to us, just as large as they appear, though we are still left with three alternatives as to the actual size, which may be a little larger, a little smaller, or precisely as large as it appears. The grounds of this dogmatic statement, as given in τελείως xi. (fr. 81 [Usener]), are that, if the apparent size, the size in relation to us, had of indifferent ways diminished still more: and this from the supposed analogy of sights seen at a great distance upon earth. In this summary case, the two extreme ideas, a large sun and Pythodorus may be treated as a single whole) Epicurus did not think it worth while to include his famous hypothesis of atomic declination, or his account of the origin of life, while there is only a passing reference to such important topics as the history of our world, and of mankind upon it.

8. Theology.—From the foregoing it is abundantly clear that to Epicurus the gods are not supernatural beings controlling Nature from outside. His denial of Divine providence and Divine interference with the world is unqualified.
he should have believed in gods at all is probably due in part to the influence of Democritus (q.v.), who postulated gigantic long-lived phantoms (bajwors), powerful for good or ill. The Epicurean gods are such evils. (i.) They do not dwell in this or any world, but in the intermedium (περιεχόμενα), or interspaces between world and world, where multitudes of gods and goddesses in human form hold converse. (ii.) They are not divided into beneficent and malevolent beings, but are all utterly indifferent to human interests. No benefits are to be expected from their favour, no punishments to be dreaded from their anger. Free from all tasks and occupations, they live solely for their own enjoyment. (iii.) They are not merely long-lived, but indestructible and eternal. The proof of their existence is the universal belief in them, which is declared to be no false opinion, but a genuine preconception (προθέξεια), which cannot have arisen except through many previous impressions of gods, all of them corresponding to an outward reality. Thus we are bound to think of them as blessed and eternal. To such superhuman excellence our reverence is due; but neither prayers, nor vows, nor prophecies have any part in true piety. These things being done merely to be just as certain, just as important in their bearing upon human happiness, as the fundamental principles of physics. But they involve a difficulty which baffles explanation. The bodies of the gods, like all creatures, ought to be dissoluble by the separation of those atoms which united to form them. This difficulty is treated by the Epicurean speaker in Cic. de Nat. Deor. (1. xviii. 49. fr. 332 [Usener]), but the passage is the despair of commentators. According to Lachelier, Scott, and Giussani, the Divine bodies are eternal because continually renewed by fresh matter, waste and repair being equal and instantaneous (cf. ζωοντας, Act. i. vili. 34 [Diog. Laert. Gr. p. 300]).

9. Ethics.—(a) Psychological predestina. Before proceeding to Ethics, it is convenient to sum up the conclusions already reached which must affect our happiness. Correct theology rids us of fear of the gods, by teaching that they do not interfere with the order of Nature; correct psychology rids us of the fear of death, by teaching us that the end of the soul is to be just as incompatible with immortality. Further, the study of Nature can alone teach us what are the true limits of pleasure and pain. As we see, for actual and contact, feelings (séôs) are the test and touchstone of sense-perception, for knowledge and opinion. There are definite limits to the increase of pleasure and pain alike. For pleasure they consist in the removal of every painful want. When this has been attained, pleasure cannot be heightened, it can only be varied (προκάλλιευ). Pain also has its limits fixed by Nature; the intensity of pain is in inverse ratio to its duration. The worst pains bring themselves to a violent end by killing the sufferer outright. Further, in pleasure it is necessary to distinguish the goal from the path which leads to it. The former is a permanent state of tranquillity or rest (καταφάτωρ δυνατος); the latter is in tension towards progress, or excitement. Such movements are fugitive states, as contrasted with the permanent peace and serenity at which they aim, their object being to get rid of painful want or to vary the pleasure which ensues upon its removal. Similarly, there are two sorts of desires, the first natural and necessary (φυσικα και διναγραμια), aiming at the present and desired to be had, and the not necessary (φυσικα και δικατεβασις), and these latter may be prompted by the false opinion that pleasure can be heightened, not merely varied, when all pain has been removed. This would explain preference for luxurios over simple fare, which Epicurus holds to be a mistake. Lastly, the pursuit of that which affords no pleasure would all be against the minor's love of glory—is a third class of desires, neither natural nor necessary, and entirely based upon false opinion. This psychological view, that there are two species of pleasure, is in close contrast with the doctrine of the Cyrenaics (q.v.), who held that pleasure is always a state of motion, and hence denied that the painless state of rest is pleasure at all. Another point on which Epicurus is at issue with the Cyrenaics is the comparison of mental with bodily pleasures. As to origin, the Cyrenaics pointed to certain mental pleasures and pains as not derived from the body (Diog. Laert. ii. 89. fr. 451 [Usener]). Epicurus held that all mental pleasure is derived from and related to the bodily pleasures of sense, affirming, in a much cited passage, that apart from these latter he had no idea whatever of the former (Theo., x. 6. fr. 67 [Usener]). As to relative intensity, the Cyrenaics pronounced unhesitatingly for the pleasures and pains of the body. Epicurus contended that mental pleasure extends to past and future objects, the opinion of the Cyrenaics was that the present. Past pleasures stored in the memory continue to be enjoyed; and, reinforced by them, even feeble present pleasure can outweigh greater present pain. Again, an assumed hope and confident anticipation of the future is a similar make-weight on the side of pleasure. On these grounds he reverses the decision of the Cyrenaics, and pronounces that mental pleasures, although they are not the supreme good, are peaceful and contain pleasures of sense, nevertheless exceed them in intensity as well as in range.

(b) The end of action.—In his theory of life and conduct (φιλοσοφία) Epicurus starts (as did Bentham, long after him) from the principle that pleasure and pain are the sole, the only possible, motives for our actions. This follows from our physical constitution. That pain must be avoided and pleasure pursued is a dictum as plainly evident as that fire is hot and ice cold. Internal sense guarantees the one, external perception the other, and each in its own sphere is a valid criterion. All experience confirms this; every animal as uncorrupted by false opinion naturally and instinctively pursues pleasure, and seeks to ward off pain. If all our striving, willing, and acting thus relate to pleasure and pain, we must find the highest good, and pain the worst evil, where by good we mean simply the end sought for its own sake, which is never a means to something else. Or, as J. S. Mill puts it, what better proof can be adduced that a thing is desirable than the fact that it is desired? Epicurean ethics is thus seen to be a system of egoistic hedonism, in which the maximum pleasure of the agent, after due subtraction of pains, is the supreme end. Of peace of mind and body, or of the health of the entire man, is the only true and permanent satisfaction in which all minor and subordinate aims are embraced. Reason enables us to foresee and take into account the consequences, pleasurable or painful, which follow from our actions, so that we sometimes choose present pain in preference to pleasure, because by so doing we ensure a greater pleasure beyond, or wish to be saved from evil itself, every pleasure is a good, and agreeable (αδικερ) to human nature, yet not all are to be chosen indiscriminately. Nor are all pains to be avoided, although pain is the supreme evil, and alien (διαλυτος) to our constitution, for the former effects may be salutary. It is necessary, before acting, to measure or weigh the consequences, pleasurable
and painful, one against the other. Reason will choose and adopt as a sober calculation of the maximum pleasure attainable, after subtracting whatever pain is involved in and consequent upon its attainment.

(10) In science.—To the end thus defined, the virtues are related as indispensable means. No one can live pleasantly who does not live prudently, honourably, and justly; and, conversely, no one who lives prudently, honourably, and justly can fail to live pleasantly at the same time, apart from this relation to the end, the virtues are worthless; and Epicurus was not slow to ridicule the absolute and unconditional value which the Stoics claimed for morality (σάλον, honesstiam) as an end in itself. If this morality has nothing to do with pleasure, what, he asks, can it stand for, unless it be the object of popular applause (populairi fama gloriosa): Civ. de Fin, ii. 15, 48, fr. 68 [Usener]? It was easy for him to show the utility of three of the cardinal virtues. Prudence (φρόνησις), the root of all the other virtues, teaches what is to be sought and what to be avoided; Temperance (σωφροσύνη) that we must allow ourselves to be led by a prudent choice by the light of a pleasure known to entail painful consequences. The function of Courage is to keep us firm against those fears of the gods, of death, and of pain which φρονησις has previously taught; whereas, it is different with the social virtue of Justice, and the duties which by it a man owes to his neighbours. How are we to prove that honesty is the best policy? How can disinterested conduct be justified in a system which makes self-love the mother of all virtues? For, if it is a psychological truth that all men by instinct and reason pursue their own pleasure and avoid their own pain, all duties must be seen in the light of this. Action can only, as the individual competes with that of every other. Again, what makes actions just, and why does Epicurus enjoin obedience to the rules of justice? He holds that injustice is not in itself an evil, and that, in the state of nature, man was predatory. But he is no longer in the state of nature; Epicurus, like Hobbes and Hume, assumed a social compact, which, once made, is ever afterwards binding. But why should the wise man obey this compact if he find secret injustice pleasant and profitable? Because he can never be sure that he will not be found out. If he escapes detection by his fellow-men, there is another sort of Divine vengeance, which, even if groundless, does more to disturb man’s peace of mind than the fruits of injustice to promote it. That such motives do not weigh with criminals is irrelevant; we are dealing now with the wise and prudent man. In his judgment, compliance with the demands of justice, honour, and equity is a small price to pay for a pleasant life, or rather a moderate premium to ensure it. As things are, through justice and equity we gain the goodwill, love, and support of our fellow-men, which contribute so much to make us happy. Thus Epicurus first stated the utility of the principles. Its rules are wisely framed to procure for each the maximum of pleasure, to adjust conflicting interests with the minimum of friction; but, if all men were shrewd enough to see this and profit by it, laws would no longer be needed. The proper function is rather to protect the wise from suffering injustice than to deter them from committing it.

(d) Friendship.—Whereas the Stoics saw in justice and philanthropy the bonds which held society together, Epicurus anised the happiest results from the voluntary association of friends. We must make friends, as we must obey the laws, because without them we cannot live safely and fearlessly, and therefore cannot live pleasantly.

We promote our own happiness by conferring benefits on our friends; it is sweeter to give than to receive (εστι γε γίνομαι τοι δι' αυτου). And ‘The man who possesses not even a bed is thrice blest: the bed maker, if he were to make it, is easily pushed further; it is, therefore, not surprising to be told that we should make sacrifices for friends, and even undergo the greatest hardships on their behalf. In all ages the school was famous for the devoted friendships of which it could boast.

10. Fate and free will. —The epistle to Menoeceus chases with the lofty claim that the man who follows its precepts will live the life of a god upon earth. At every moment the pleasures he enjoys far outweigh his pains; his future is secure; even on the rack he will be happy; give him bread and water, and he will not fall short of Zeus in enjoyment. The Stoics made promises no less extravagant, and Epicurus could not afford to be outdone by his rivals. But he differed from them fundamentally in his view of the future. The Stoics retained the theory laid down by Democritus, that all events are equally determined, and linked together in one unending series of causes and effects; that the future is thus inevitably fixed, and could conceivably be foreseen with certainty at certain points in the series. Epicurus rebelled against this doctrine. The past, he admitted, was determined, but not the future. So tenacious was he of this distinction, that he would not allow the validity of a disjunctive proposition relating to the future, such as: ‘Hermarchus will either be alive or not alive to-morrow.’ He was afraid (Cic. de Fato, x. 21, fr. 376 [Usener]) that in granting this he would be granting الحكم, and foredooming every event necessarily determined. His own view is that some things happen by chance, and some are due to human agency (δε δει καθηκεν, δε δει ναυτεν; Diog. Laert. x. 133, p. 65 [Usener]), where the context shows that ους τρόπις και ναυτὸς must imply some sort of spontaneity and free will. This is a direct denial of Lencippus’ maxim, ουδὲν χρηζίαν αδρων αιτειναι. With pointed allusion to L. and Democritus, he held that it would be better to believe the tales about the gods than to become the slaves of the inexorable Fate of the physicists (καθηκεν τοιν τοι ναυτεν μᾶλλον κατακαθηκεν τοιν τοι τοιν τοιν), and that he would not allow the validity of a disjunctive proposition relating to the future, such as: ‘Hermarchus will either be alive or not alive to-morrow.’ He was afraid (Cic. de Fato, x. 21, fr. 376 [Usener]) that in granting this he would be grantingحكم, and foredooming every event necessarily determined. His own view is that some things happen by chance, and some are due to human agency (δε δει καθηκεν, δε δει ναυτεν; Diog. Laert. x. 133, p. 65 [Usener]). To what limitations this doctrine of contingency was subject is not known; but it is very improbable that it was carried so far as Guyan (La Morale d’Epic. ch. ii.) supposed. See also LECRÈTIEUS.

R. D. HICKS.
was generally observed by A.D. 325, and was probably not yet universal in 311. This is shown by the evidence of the Arians and the Donatists. The Arians appear to have celebrated the feast, for Greg. Naz. says that in 372 the Arian Emperor Valens ordered the church at Ceresara in Cappadocia, and shared in the Epiphany feast.1 Considering the intensity of feeling between Arians and Orthodox, it is extremely improbable that either party would have observed a feast which had been introduced by the other (cf. also Usener, 'Weihnachtsfest,' p. 192 f.). Thus it is probable that the Epiphany feast belonged to the services of the undivided Church, and, therefore, must have been introduced before 225. On the other hand, it can scarcely have been universal before 311, when the Donatists broke away from the Church; for Augustine in preaching about the Epiphany complained that the Donatists did not celebrate it. It is not probable that the Donatists abandoned any established Christian custom, and it seems, therefore, to be almost certain that the Epiphany was introduced after their schism; but, of course, this is solely for Africa only; and, although it justifies the view that the feast was not generally observed before 311, it does not exclude the possibility that it was celebrated in some churches at an earlier date. It is therefore necessary to turn to certainty by a reference to the Epiphany in the Martyrium of Philip of Heraclea († 304), and by the statement in Ammianus that, when Julian was in Vienna in Gaul, he visited the church at the Epiphany.

Some writers have quoted the homily of Hippolytus, εἰς τὰ δύο θεοφάσια, as α proof that the Epiphany existed in Rome in the middle of the 3rd cent.; but this statement must probably be abandoned. It is very doubtful whether this tract belongs either to Hippolytus, to the West, or to the 3rd century. Internal evidence shows that it was more probably a sermon delivered at the baptism of some distinguished person in the Eastern Church, and probably in the 4th century. It may have been at the feast of the Epiphany; this is not probable on internal evidence but also because the Epiphany was a favorite day for baptism.2 Still earlier is the evidence of Clem. Alex., who states that the Basilians observed the feast of the Baptism on Jan. 6,3 but his words seem distinctly to imply that the festival was not observed in Catholic circles. The evidence for the celebration of the feast among Gnostics is, therefore, about a century earlier than that for its existence among Catholics.

As was shown in art. CHRISTMAS, it is certain that in the East Jan. 6 was the feast of the Nativity as well as that of the Baptism, and it is probable, though not quite so certain, that the same is true of the West. But in the 4th and 5th centuries Dec. 25 was gradually adopted as the feast of the Nativity, and ultimately became universal, except in Armenia.

The history of the feast of Jan. 6 after the acceptance of Dec. 25 for the Nativity is not quite the same in the East as in the West. In the East it remained the feast of the Baptist, as may be seen, apart from the liturgical arrangements for the day, from the sermons of the Eastern Fathers, and from the hymns. But in the West it came to be chiefly associated with the visit of the Magi to Bethlehem, though the connexion with the Baptism was never entirely forgotten; in addition to this, there was no association with the feast, and later there was a tendency to regard it as a celebration of all manifestations of the Divine nature of Christ.

So far there is no doubt. The problems which arise are: (1) Was Jan. 6 originally a feast of two distinct events, the Nativity and the Baptism, or of one only; and if the latter, what was the course of its development? (2) Why was Jan. 6 chosen as a special feast, apart from the question as to which event was celebrated on it?

I. The original character of the feast of Jan. 6 and its modification.—There is no sufficient evidence to justify a confident answer; acceptance of Dec. 25 for the Nativity is not quite the same in the East as in the West. In the East it remained the feast of the Baptist, as may be seen, apart from the liturgical arrangements for the day, from the sermons of the Eastern Fathers, and from the hymns. But in the West it came to be chiefly associated with the visit of the Magi to Bethlehem, though the connexion with the Baptism was never entirely forgotten; in addition to this, there was no association with the feast, and later there was a tendency to regard it as a celebration of all manifestations of the Divine nature of Christ.

Now, it is tolerably plain that in connection with the doctrinal controversies of the 4th and 5th centuries there was a tendency to emphasize the Nativity and distinguish it from the Baptism, and that this was one of the reasons which led to the establishment and exaltation of a separate feast on Dec. 25. To go farther is difficult. The points which stand out are that in the West the feast came to be connected with the Magi, and that Jerusalem, which, if we are to trust Macarius, had originally celebrated the Baptism on Jan. 6, probably selected the character of the feast and connected it with the Nativity. So far did this go that Epiphanius not only maintains that Jan. 6 is the date of the Nativity, but says that a different date, Nov. 8, was that of the Baptist.1 Obviously these changes were made because the Church was contending with some disputed doctrine concerning the Baptism of Christ, and desired to exclude it, or the danger of it, from the celebration of the Epiphany. The exact proof is difficult to obtain, in the absence of any direct statement; but there are enough indirect allusions to show that the danger was the doctrine that Jesus was born on this day, rather than at the Nativity, or that He obtained regeneration through baptism in the same manner as Christians. The evidence for this view is too scattered to be given in full. The following must serve as an impression of its character.

Among the correspondence of Leo (440-481) there is a letter to the Sicilian bishops (no. 18), and it is clear from his protests that there was in Sicily a tendency to regard the baptism of Jesus as having conveyed the same grace to Him, and having borne the same import for Him, as the baptism of believers.

1 η επιστολή εν τῷ ἑορτήσιν τοῦ ἐναλόγα ἐπεμφάνισεν, τῇ καταφύσει ἔτη τοῦ ἑορτήσιον ἐναλόγα, τούτου καὶ Μητροπολίτης Ἀλέξανδρος, πρὸ ἔτος Ἀπριλίου (Ταυρον. 61, ed. Dindorf, ii. 452 f.).
conveys to and bears for them. The vigour with which Leo protests shows that this doctrine existed in Sicily. It is also not improbable that a similar feeling underlies Pope St. Irenaeus’ letter to Himerius of Tarracon in 355, in which he protests against the same doctrine. Furthermore, p. 273. The definite traces of this type of heresy may be found in various homilies on the Epiphany, among the Spuria of Augustine, Ambrose, and Maximus. In pseudo-Augustine 136, for instance, the writer says: ‘Let us celebrate Christ’s baptism, keeping watch over our purity; because this is the regeneration of Christ and a strengthening of our faith.’ It is difficult to define its exact limits, but there is no doubt that the view, ultimately derived from early Adoptianist sources, lingered on for a long time, that Jesus was in some sense regenerate, or even that He became Christ, in the Baptism, and that this heresy necessitated the efforts of the Church so to handle the feast that its heretical explanation should be excluded. Hence, especially in the genuine homilies of Augustine, the Epiphany is treated as primarily the celebration of the coming of the Magi, and not of the Baptism.

2. The original choice of Jan. 6.—The solution of this problem is unattainable at present. The fact which stands out is that the earliest evidence for the day of the festivity comes from the East. We have every reason for believing that these Gnostics were syncretistic in their methods, and this draws attention to a story in Epiphanius (Panarion 51) as to the feast which used to be held in Alexandria in the Kedron, or Temple of Kore, on Jan. 6. He says that on the eve of that day it was the custom to spend the night in singing and attending to the images of the gods. At dawn a descent was made to a naked, and a wooden image was brought up, which had the sign of a cross, and a star of gold, marked on hands, knees, and head. This was carried round in procession, and then taken back to the crypt; and it was said that this was done because ‘the Maiden’ had given birth to ‘the Aecon.’ With this may be compared the statement of Macrobius (i. 18. 9.):

’Sed ut pervertis videtur, hie semel sacrificata, quam quemque pectora misit haberes verumque videre st erat, et in eam imaginem salutis,’

and the statement in Cosmas Indicopleustes (PG xxxvii. 341):

‘τάν σαυρον ἐν αγιω τον νησίου τῇ ἑλληνικῇ καθ' ἐναλλακτικα καθ' ἐν οἴκοι τοῖς θεοσεκρητοῖς ὁ θεοσεκρήτης, ἔμνησεν αὐτοὺς ἀργοῖς ἐξέδωκεν τῶν παρθένων κτέρες τῶν θεῶν.’

It is possible that Cosmas himself believes this to be Dec. 25, but, as he refers to Epiphanius, it is not improbable that it was really Jan. 6. In this connexion the usual name for the Epiphany in Greek, ἑλπιδοι τῶν φωτόν, obtains a new importance (see further F. Cumont, ‘Le Natalis Invicti,’ in CAJL, 1911). The existence of a heathen feast of this kind would afford ample explanation of the growth of a similar Christian feast, either by way of syncretism or of rivalry; and a more or less Docetic or Adoptianist form of Christianity would naturally regard the Baptism as the spiritual counterpart of this feast.

Another line of possibility is contained in the constant connexion of Epiphany with the rite of ‘Blessing the Waters.’ In the earliest Syriac, Coptic, and Greek Epiphany rites there is a ceremony of consecrating water, usually that of the local river, for baptism. There is reason to think that this represents an originally pagan custom. According to Epiphanius (Panarion 51), there was sometimes a festival in Alexandria a festa called ἐργεία (see F. Chaline, Le Calendrier des jours fêtes et festa de l’antique égyptienne, Paris, 1870, p. 60). This festival was on Tybi 11 (Jan. 6), and it was the custom to draw water and store it because of the especial merit which it then acquired. Aristides

ruhed in the 2nd cent. also mentions this custom, though he does not specify the date. He also states that the water used to be exported for use abroad, and that—unlike all other water— it was supposed to improve with age, like wine (Orat. ed. Oxon. 1206, loc. cit.). In 321 Epiphanius goes still further, and says (loc. cit.) that the water actually became wine; and he connects this fact with the celebration of the New Year (Dec. 25). The miracle of the Epiphany. It is also probable that this custom was not confined to Egypt or the Nile; Epiphanius goes on to state that at that season many fountains turned to wine. There was at Cibyra in Caria a fountain of this sort, and another at Gerrass in Arabia. Epiphanius had actually drunk of the fountain at Cibyra. In Rome libations were made by the priest of Isis with Nile water; and Plutarch tells us that the water which was used in this connexion in procession was in some sense an influence of the god himself (De Is. et Osir. 36; cf. also Clem. Strom. ed. Syburg, p. 534).

Behind all these customs there is probably (though it is scarcely susceptible of proof) an ancient belief to the effect that at the turn of the year water was especially dangerous, owing to evil spirits; and that it became propitious once more when it was mixed with wine. He also tells us that he did not drink water from the river on Tybi 5 and it is better not to do so a whole month previously), but on Tybi 9 the blessing of Heaven descends on the river. Probably nothing will in the end throw so much light on the origin of the Epiphany feast, and also on that of Baptism, as a general study of the primitive belief of the connexion between water, the spirit world, and the cycle of the sun.

LITÉRATURE.—H. Uccius, Religionsgeschichte. Untersuchungen, i. ‘Das Weihnachtsfest,’ Bonn, 1899, 1910; P. de Lagarde, Mittheilungen, Göttlingen, 1843-49, iv. 241 ff. There is a valuable article in P. R. K. v. 641-47 by Caspar, but much more may be expected if, or when, Conybeare’s collection of material is published.

KIRSCH LAKE.

EPISCOPACY.—The term ’episcopacy’ is used in the present article to denote that system of the Church in which bishops (in the ordinary modern sense) have the word ’bishop’ attached to their name, on which the continued life of the Church depends.

1. New Testament.—In the NT the word ‘bishop’ (ἐπίσκοπος) is used to denote the same office as the word ‘presbyter’ (πρεσβύτερος). See Tit. 1:7, where Paul, in directing Titus to appoint presbyters in every city, and describing those who were fit to be presbyters, says: ‘For one who is a bishop must be blameless, as God’s steward,’ thus using the word ’bishop’ to apply to the person who has been called ‘presbyter’ immediately before; Ph 1, 1 Ti 3:2, where bishops and deacons are mentioned side by side without any reference to presbyters, and where the passages would plainly demand some distinction of the presbyters if they were different from the bishops; Ac 20:28, where those described in the narrative as the presbyters of the church are addressed by Paul as bishops (cf. also 1 P. 5:2). It was usual in the NT to appoint the office of bishop—(ἐπίσκοπος—is used for those who are addressed as presbyters; but RV and WII omit). A comparison of these passages will show that it is thought these offices adequate. Evidence to the effect that the terms ‘bishop’ and ‘presbyter’ are used interchangeably. The use of the word ’bishop’ in

1 Owing to the change of calendar, the equivalence of the months is now different; and Tybi 9 = Jan. 16, but this is, asit were, only a modern accident.

2 Against this, see van Welzl’scher (ii. 329-331, Eng. tr.) who distinguishes the terms; and Hort (pp. 190-191, who regards
EPISTOLACY 333

the NT then does not itself denote the existence of episcopacy in NT times. It remains to inquire whether there are other indications to show that episcopacy existed. Of such indications there are the following: (1) the position and work of the Apostles; (2) the suggestions as to the position of the bishops, the Lord's 'brother' at Antioch; see Ac 11', where Peter directs that his release from prison be announced to 'James and to the brethren'; 152 5 where James appears to be represented as having presided at the council of Jerusalem; 213 where the reference is to Paul, that he 'went in' unto James; and all the presbyters were then present, shows that James was then presiding in the church at Jerusalem; Gal 2', where Paul, referring to Jerusalem, mentions James before Peter as well as before John, contrary to the usual order in the NT; (3) the rule of the Apostolic delegates Timothy and Titus at Ephesus and Crete; see the Pastoral Epistles, pastor; (4) the use of the laying on of hands as a link in the ministry by the original Apostles and Paul and the Apostolic delegate Timothy: see Ac 6', where the seven men of good report were ordained by the Apostles laying their hands on them with prayer; 1 Ti 4', 2 Ti 157, where Paul refers to Timothy having been ordained with the accompaniment of the laying on of hands of the presbyters (οι επίσκοποι των χριστου Which by usage of the term implies that he did not know of recognized Christian bodies anywhere without bishops, and that he regarded the latter as necessary to the existence of the Church. He says that, apart from bishopric, one cannot be a Christian (ος ουχο εν τω εκκλησια τω καλειται). He refers to the necessity of bishops, (1) that there may be a center of unity for discipline and prayer, (2) that the bishop may be the representative of Christ and of God, and (3) that the Episcopacy may be securely, and Baptist and other rites lawfully, administered.

It is, therefore, to discern one Episcopacy . . . there is one altar, as there is one bishop together with the presbytery, and even a fellow-servant'; Let that be lawful to a valid (Gnath) Episcopacy, which is under the bishop or one to whom he shall have committetis; "It is not lawful apart from the word 'bishop' not as denoting an office, but as simply meaning generally one who is in a position of oversight.

1 Acts 2.1-41; 11.19-30; 15.1-30; 18.18-22; 20.17-38; 1 Cor. 3.1-15; 5.1-15; 16.17-18; 2 Cor. 1.11-13; 2 Tim. 1.1-5; 2.25; 3.1-5; 1 Tim. 1.1-3; 4.11-16; 5.17-24; 6.11-16; 2 Tim. 3.1-5; 4.1-8; 1 Pet. 2.21; 5.7-10; Tit. 1.1-3; 2.1-15; 3.1-7; 1 John 1.1-7; Rev. 1.20; 2.1; 7.16; 11.18; 14.1-5; 21.10-22; 22.1-5; 23-42; 24.16-21; 25.1-13; 26.17-27; 27.1-54; 28.1-22; Eph. 2.19-22; Phil. 2.15-16; 3.15; Col. 1.13; 2.14-15; 3.10-16; 4.15-18; 1 Thess. 4.13-18; 5.1-11; 1 Tim. 1.11-20; 2.1-7; 3.1-7; 4.1-6; 5.1-20; Tit. 1.1-3; 2.1-14; 3.1-7; 1 John 1.1-7; 2.1-17; 3.1-4; 4.1-5; 5.1-10; 3 John 1.1-12; Jude 1.1-25; Rev. 1.1-16; 2.1-7; 3.1-6; 7.1-3; 10.1-11; 11.1-19; 12.1-18; 13.1-14; 14.1-20; 15.1-6; 16.1-19; 17.1-18; 18.1-24; 19.1-20; 20.1-12; 21.1-22; 22.1-5; 24.1-22; 26.1-18.

Towards the end of the 2nd cent., about the year 181, the notion of episcopal succession from the Apostles is emphasized by Irenaeus in Gaul as a guarantee for the preservation of the truth: see Euseb. Hær. III. ii. 1. There is evidence like Africa in a passage from Tertullian, writing at the end of the 2nd cent., and referring to episcopal descent from the Apostles as affording the proof of the life of the Church: see de Præsc. Hær. 52. The ordinary belief of the 3rd cent. is expressed by St. Cyril, who says: 'Any one who is not with the bishop is not in the Church' (Ep. lvii. 8). The rites which lie here behind the Canons of Hippolytus (Roman or African, 2nd or 3rd cent.), the Liturgical Prayers of Simeon (African, 1st cent.), and the Apostolic Constitutions (Syrian, 4th cent.) contained a clear distinction between the office of bishop, presbyter, and deacon. (For what may be a different element in the Canons of Hippolytus, see below.) As Rome, the lists of the bishops of Rome afford weighty testimony to episcopal government, and to the episcopal government being that of a single bishop. The value of these lists has often been questioned; but Irenaeus, in his essay on the early Roman succession showed with great conclusiveness that there was really one (and not, as many had thought, more than one) tradition as to the early bishops, and that this tradition went back to the middle of the 2nd century (see his Apostolic Fathers, i. 1. [1890] 201-545). A reference to 'Clement, to whom is entrusted the charge of sending to the foreign cities (ἐπισκόπων & καθεδρον και ερημίας ἡ λέγεται τις ἐν τῷ εὐαγγ. ἐκκλήσια τῶν ἐν Πατρίαλα, in the Shepherd of Hermas, a Roman document of the end of the 1st cent. or of the middle of the 2nd, may allude to a bishop as chief ruler at Rome (Vic. ii. 4 (3). The lists of bishops of Jerusalem, Antioch, and Alexandria given by Eusebius may also be mentioned. They have much less authority than the lists of the bishops of Rome, but have some importance; and the evidence of the Antiochene list is corroborated by the testimony in the Epistles of St. Ignatius (see the lists collected from the Ecclesiastical History and Chronicle of Eusebius (p. 87) in the Tract of St. Gregory, in his tr. of Eusebius in Nicene and Post-Nicene Fathers, p. 402). If the evidence which has so far been mentioned stood alone, it would hardly be possible for any scholars to hold an opinion otherwise than that of the Church government in Rome and throughout the West as well as in Asia Minor from the earliest times. A different opinion, however, has been based on other evidence and linked with the references to the 'prophets' in the NT already alluded to. In the Teaching of the Twelve Apostles, a Syrian or Alexandrian document of the 1st or 2nd cent., probably composed for Christian use on the basis of a Jewish manual, the prophets fill an important place. A true prophet is said to 'speak in the Spirit,' and to 'have the ways of the Lord.' The prophets are called 'your chief priests' in connexion with the reception of first-fruits—a usage which suggests comparison between the position occupied by the prophets among Christians and that occupied by the priests among the Jews. The local ministers are described as 'bishops' (i.e. presbyters) and 'prophets and deacons; an indication of their dignity is that they perform the service (λειτουργουντοι . . την λειτουργίαν) of the prophets and teachers, and that they are the most honored or prominent. The text is not final. It does not, it may be well to notice, specify the method by means of which the bishop receives his office. He says nothing about succession, and he does not mention the laying on of hands.

1 Following the Eusebian Canon, Irenaeus gives to the following: see Ac 11'. 137; 157; 191; 218-19; Ro 11.14; 1 Cor. 11-15; 2 Cor. 10.39; 2 Ti. 1.8; 2 Tim. 1.12; 4.4. 6; 16; 20; Magn. 2.3; 6.7; 13; Tit. 2.3; Phal. 3.4; Smyrn. 8.3.
prophets and teachers." Instruction is given that the gifts are to be exercised to 'order thanksgiving as much as they desire' (ευχάριστον δόνα ἑλθοντοι)—a phrase which probably means to celebrate the Eucharist at such length and with such frequency (cf. 1 Cor. xiv. 34, 42; 1 Thess. iv. 17; 1 Cor. xiv. 1-6; 1 Cor. xiv. 34; Apol. i. 67; Cont. Ap. viii. 12). There is no indication that the local ministry of 'bishops' and deacons was ordained by a higher order as well as chosen by the people; and there is nothing to show whether the prophets were or were not ordained. Some writers hold that this silence is a proof that there was no ordination in either case, but in connexion with such matters the incomplete and fragmentary character of the book must be borne in mind (Teaching of the Twelve Apostles, x. 7, xi. 3-12, xii., xv. 1.2, xvi. 3). The Shepherd of Hermas contains instruction how to distinguish a true from a false prophet by the observation of characteristic; but does not show whether the prophet was in any way appointed to his office (Menod. xi.). Prophets held a prominent place in the Montanist movement which began from Phrygia in the second half of the 2nd cent. Montanists maintained that the prophets and spiritual persons possessed the powers which were wrongly claimed by the officials of the Church. For instance, Ter- tullian in his Apologeticus writes: The Church will heed not forgive sins; but it will be the Church, the Spirit by means of a spiritual man, not the Church the number of the bishops' (de Prol. 21). It is a theory of some writers that in this respect the Montanists preserved the original tradition of the Church.

With the references to the prophets in the NT and the later evidence from the Teaching of the Twelve Apostles, Hermas and the Montanists, the privileges ascribed to the 'prophets' are in some quarters have been associated by writers who hold that the original constitution of the Church was not episcopal. A study of the Church Orders brings out the existence and alteration of a profession that a confessor might be accounted a presbyter without receiving ordination. The Canons of Hippolytus enact that one who has been tortured for the faith is to be regarded as a presbyter without ordination by the bishop if he is a freeman, and that if he is a slave he must be ordained, but the bishop is to omit the part of the prayer which relates to the Holy Ghost. A confessor who has not been ordained is a presbyter and not a deacon. The later Egyptian Church Order contains confused and inconsistent statements, which show traces of a similar provision to that in the Canons of Hippolytus as well as of its reversal (canons 24, 25, 54, 55 of the Ethiopian text; and canons 34, 67 of the Sabean text in Horner, The Statutes of the Apostles, 1904). The Apostolic Constitutions prohibit a confessor from acting as a bishop or presbyter or deacon unless he has been ordained (canon 12). A similar line of thought to that indicated by the allowance of this privilege to the confessors may have underlain the clause made at Carthage in the 3rd cent. that those who had suffered persecution and torture and danger of death for the faith might re-admit communion Christians who had apostatized (see, e.g., Cyprian, Ep. xvi. 111.). With this group of evidence may be taken an obscure sentence in the Canons of Hippolytus which occurs in the description of the rite of consecrating a bishop, a canon of the Council of Ancyra of 314, some alleged instances of ordination by presbyters, and statements about the Church of Alexandria. The sentence in the Canons of Hippolytus, 'Then, from among the bishops and presbyters let one be chosen who is to lay his hands on his head and pray, saying,' has been thought to form part of the older strata incorporated in the present text of the Canons, and to embody a primitive custom. That the ordination was not restricted to bishops prior to the clear distinction between bishops and presbyters already mentioned, and to the regulation by which the power of ordaining is explicitly said not to be committed to presbyters (canons of Hippolytus, 30-32). The thirteenth canon of Ancyra, according to the text adopted by J. B. Lightfoot and as translated by him (Philippians, pp. 232, 233), enacts that 'it is not allowed to country-bishops (συζευκόντων) to ordain presbyters or deacons, or even to city-presbyters (μυθον καθητηρον ούκ οίκος), except permission be given in each parish (εκ ημών ραητοί) by the bishop in writing'-an enactment which has been understood to mean that episcopal ordination can in some cases be dispensed with, if there is no simultaneous sanction, which on such an interpretation would testify to episcopal government as a fact, but would be inconsistent with an understanding for episcopal ordination exists as a matter of principle. To the present writer the true text and translation of the canon appear to be: 'Country bishops may not ordain presbyters or deacons, no, nor town presbyters either (ούκ οίκον), without the written consent of the bishop, in another diocese (εκ ημών ραητοί).'

The alleged instances of ordination by presbyters of Felicitians in the West is in the middle of the 3rd cent., the presbyter Novatus (Cyprian, Ep. iii. 2), of Daniel in the East in the 4th cent. by the abbot Pap- nutius (Cassian, Cont. iv. 1), and of St. Aidan in the 7th cent. by the abbot and monks of Iona (Be Like HE, III, iii. 5) (see probably in some cases the phrases 'appointed (constituuit), 'made' ('fecerat) a deacon, 'was preferred (est pretexuit) to the office of deacon,' 'he promoted (prosequi) him to the honour of the presbyterate,' 'ordinating (ordi- nante) him,' refer not to the act of ordination but to the making of arrangements for that act. As regards Alexandria there is a series of statements which need careful consideration. Jerome, after speaking of the identity according to his theory, of bishops and presbyters, proceeds:

'When afterwards one was chosen to preside over the rest, this was done as a substitute for schism, and removed the individual from rending the Church of Christ by drawing it to himself. For even if he is to be a presbyter or bishop, and not a deacon, he must be ordained; and it is a better course for the Evangelist to the episcopates of Hieraclea and Dorylaenus, the presbyters used always to appoint as bishop one chosen out of their number, and consecrated on a higher level, which or which should make a commander, or as it deacons should choose one of themselves whom they knew to be diligent, and call him an archdeacon. For, with the exception of ordination, what does a bishop do which a presbyter does not?' (Ep. cxxxv. 1.)

In a letter written by Severus, the Monophysite Patriarch of Alexandria between 518 and 538, it is said that formerly at Alexandria the bishop was appointed by the presbyters, and that it is by a later custom that his 'sollemn institution has come to be performed by the hand of bishop' (see E. W. Brooks, in JThSt ii. [1901] 612, 613). In the collection Apophthegmata of the Fathers, parts of which are probably as old as the second half of the 4th cent., 'certain heretics' are said to have abused the Archbishop of Alexandria 'as having received his ordination from presbyters' (Apop- thegmata, Patrum, 78, in PG lxv. 841). The 10th cent. writer Methodius of Byzantium, the Metropolitan or Uniate Patriarch of Alexandria, who took the name of Eutychius, gives a circumstantial account that 'the Evangelist Mark appointed, together with Anastasius the Patriarch, twelve presbyters to be with the patriarchate, when the patriarchate was vacant, they should choose one of the twelve presbyters, and that the other eleven should lay

their hands on his head and bless him and make him patriarch, and afterwards should choose some eminent men and make him presbyter with themselves in the place of him who had been chosen, and says thus twice, and adds that this custom was changed for the later custom in the time of the Patriarch Alexander in the first half of the 4th cent. (Annals in Pet. ii. 9). (Lat. tr. P. and C. p. 424.) According to a passage in Poecilus's ed. Ox. 1659; and of this passage in Selden, Eutychii Egyptii Orig., Lond. 1642).

None of this evidence appears to the present writer to counterbalance the testimony which indicates that Hermas's system of ordination was not that of the ordinary system in the Church from the first. It is easy to exaggerate the importance of the Teaching of the Twelve Apostles; and it is very questionable what inferences can rightly be drawn from its silence. Apart from a comparison with the Teaching, no conclusions contrary to episcopacy could be derived from the references to the prophets in the Shepherd of Hermas. The general history of the Church in the 2nd and 3rd centuries does not support the opinion that the Montanists retained a survival of the original tradition. The privileges allowed to the confessors seem to have been merely an outgrowth of the exaggeration being sometimes attached to sufferings on behalf of the faith. If the text and translation of the canon of Ancyra are as already suggested, the canon does not allow of any authority for bishops, but is simply a disciplinary measure designed to prevent the bishops appointed to supervise the Christians in country districts from encroaching on the rights of the diocesan bishops. The alleged instances of ordination by others than bishops do not, in the light of the consideration which has been already urged, bear examination. The case of the Church at Alexandria is much more important than the others. But here there is great doubt about the facts. In the midst of his statement on the equality of bishops and presbyters, Jerome, by introducing the sentence, 'With the exception of ordaining, what does a bishop do which a presbyter does not?' appears to restrict ordination to bishops; for it is hardly an adequate interpretation of his words to suppose that they merely indicate the practice which had come to be in his time, and are not in any way an assertion of the principle. Eutychius, apart from corroboration of his statements, is not regarded by any one as a trustworthy authority. It is not unlikely that there were different usages among the Anthropaeans, who is known to have been episcopally ordained; and it may be observed that Origen, who had plenty of opportunity for knowing the facts about Alexandria, does not show that he was acquainted with any such method of appointing the patriarch as Eutychius mentions.1

The state of things at Rome and Corinth at the end of the 1st cent. and in the first half of the 2nd cent. needs separate consideration. The epistle of Clement of Rome to the Corinthians, written about the year 96, lays strong stress on successions from the Apostles as a part of the ordered system of the Church. The Church, says Clement, is from the Apostles, and so, through the Apostles, from Christ, and, through Christ, from God. His epistle does not afford any clear evidence whether he regarded this Apostolical succession as necessarily preserved by means of bishops. The word 'bishop' is used in it, as in the NT, to denote the same persons as the presbyters. The presbyters are spoken of as filling posts of authority at Corinth. It is not clear whether the apostolical succession was made up of posts of bishops or presbyters. In two passages (3, 6) there is a doubt as to the meaning of the words 'rulers' (προφυαγόμενοι, and πρεσβευόμενοι, and in another passage (3-5) there is a doubt about the meaning of the phrase 'men of account.' (LXX. τοις πρεσβευόμενοι.) Of these passages taken by themselves there are three possible interpretations. (1) The phrases 'rulers' and 'men of account' are used in a specific sense to denote the holders of the highest posts of authority. (2) The phrases 'rulers' and 'men of account' are not used in a specific sense, but are simply synonyms for the presbyters; the word πρεσβευόμενοι in chs. 3, 6 denotes older men, not the presbyters; it follows that the presbyters held the highest rank in the ministry at Corinth and ruled the Church there, but there is no reason to suppose that they had not been ordained in such a way as to receive the episcopal powers which in Asia Minor and at a later time in the West were limited to the diocesan bishops. (3) The presbyters held the highest rank and exercised the chief rule, and there is no reason to suppose that they were ordained in any different method from the presbyters considered as 'rulers' in the present, Hermas mentions deacons, presbyters, bishops (about whom nothing shows whether they are to be identified with the presbyters, as in the NT and St. Clement of Rome, or to be distinguished from them), prophets apparently hierarch, 'rulers of the Church' (οἱ πρεσβεύομενοι τῆς ἐκκλησίας, and Clement (Ves. ii. 2, 6), 3, 4, 5), (3), iii. 1, 5, 9, 7, Mont. xi. 7, Sim. ix. 25, 26 (2), 27 (1), 22. Apart from the references which have already been mentioned, there is the same doubt as in the epistle of Clement of Rome whether the 'rulers of the Church' are to be identified with the presbyters or to be distinguished from them. The presbyters are said to preside over the Church (τῶν πρεσβευόμενων τῶν προφήτων τῆς ἐκκλησίας); and the 'occupants of the chief seats' (τοίς πρωτοκαθήμενοι) are either identified with or closely associated with the 'rulers of the Church.' Here again there are three possible interpretations: (1) there are three groups of officers, Clement the bishop, the 'rulers' as a special class under him, the presbyters, or there are two ranks of officers, a bishop, and the presbyters also called 'rulers'; (2) there is one group only, described as presbyters or as 'rulers,' of whom Clement was in the chief place as the presiding presbyter, but was not the holder of any different office from the rest. It is probable that decisions in regard to the interpretations to be placed on the epistle of Clement and the Shepherd of Hermas concerning this matter will be largely influenced by views of the evidence as a whole; and that in forming this general view the determining factor will be the importance attached to the list of the bishops of Rome as indicating a succession of single bishops at Rome from the first on the one hand, or to the position of the prophets regarded as a ministry independent of official rule on the other hand.

Later times. — It is clear that from the middle of the 2nd cent. onward the settled system of the Church was episcopal, and the episcopacy that of a single bishop, everywhere (on the theory of an exception at Alexandria, see above), and that this was the case whether the bishops were in Asia Minor and the East. Episcopacy and the rule of a single bishop then remained as the constant and universal tradition until the 16th cent., when the use of it was challenged in some quarters, and considerable bodies of Christians

who were without episcopal government gradually grew in numbers and in importance. The existing state of things was the outcome of influences derived from the pre-Reformation tradition and of new influences which arose in the course of the Reformation. In the churches of the East, episcopacy is regarded as a Divine institution, appointed means for the preservation and rule of the Church and the transmission of sacramental grace, and as essential in those who ordain. In the Church of Rome, bishops are held to be the Divine institution and appointed means and are the only ministers of ordination. Their position as rulers has been greatly modified by the practice and by the Pope. It has been much disputed whether the episcopate is a distinct order from the priesthood or only an extension of it. Most of the great schoolmen, including Aquinas (Sent. IV. xxiv. 3; Sum. Theol. Super. xi. 5), but not Dun Scotus (Sent. IV. xxv. 1, 2 ad 3), held that it is not a distinct order. The Council of Trent, while asserting that the hierarchy is Diviney instituted and consists of bishops, presbyters, and deacons, and that bishops are superior to presbyters and laity; the rule is in the hands of boards; then that the power of bishops is not common to them with the presbyters, was careful not to make any decision on this disputed point (Sess. xxiii. can. 6, 7). Of late years the prevailing opinion has been that the episcopate is a distinct order. In the Church of England great care has been taken to prevent the ministrations of any minister who are not episcopally ordained, and it is declared that 'from the Apostles' time there have been these orders of ministers in Christ's Church, bishops, priests, and deacons' (preface to the ordinal); but the phraseology used in the twelfth-third Article of Religion, by no means defining one who have public authority given unto them in the congregation to call and send ministers into the Lord's vineyard, stops short of requiring an opinion that in the abstract episcopacy is necessary to the maintenance of the ministry. Anglican divines have agreed that episcopacy is right; they have differed in the degree of emphasis with which they have asserted this; and they have not been agreed on the question whether episcopacy is actually necessary to a valid ministry as well as the proper means of conferring it. The German and Swiss Old Catholics and the Old Episcopal (popularly known as 'Jansenist') Church of Holland have received the claims of the bishops; but the Anabaptists, who have abandoned it. The Danish and Norwegian Lutherans, though retaining the title 'bishop,' are clearly without an episcopal succession, and 'bishop' is merely a name for a chief officer or superintendent. The case of the Swedish Lutherans stands on a different footing from that of the Danes and Norwegians, and there has been much discussion whether they have really preserved the episcopal succession which they believe that they possess. The Moravians claim an episcopal succession; but in their case also there is considerable doubt about the facts. Their bishops are simply an ordaining body, in the ordinary course of things do not recognize the validity of presbyterian ordination, and do not regard bishops as necessary for the administration of confirmation. The various Non-conformist bodies in Great Britain and Ireland and the allied communities in America do not possess episcopacy.1

1 The 'Protestant Episcopal Church in the United States of America' (in communion with the Church of England) owes its orders to Bishop Seabury, who was consecrated by three Scottish bishops in 1784, and to Bishops White, Provoost, and Madison, who were consecrated by English archbishops and bishops in 1785. The first 'bishop' of the so-called 'Methodist Episcopal Church' in America was Thomas Coke, who was set apart as a 'superintendent' by John Wesley in 1784, and received the title 'bishop' from the American Methodists Conference in 1785.
sence of the Christian consciousness, or of the voice of the Catholic Church, this universal acceptance throughout so many centuries makes a strong 

clear up all the other. The practical operation of the Christian the operations of the Spirit in the Church must decide how the life of the Church is maintained, and a question on this subject re- 
ed upon once a common work—in its Scope and Long-continued unification with which it has been believed that without the bishop there is not the Church. 

(6) Yet an argument of a different kind may be drawn from the signs of spiritual life which have been from the very beginning of Christianity since the 16th century. There are those who say that this fact weighs with them more heavily than the unification of many past centuries, even when the past is coupled with the impressive spectacle of the theory and practice of the churches of the East, of the Church of Rome, and of the Church of England at the present time. Those who so think do not consider that their contention is adequately met by any considerations derived from the unquestioned truth that ‘the power of God is not tied down to visible sacraments’ [Aquinas, Sum. Theol. III. lixv. 2; cf. Of Holy Orders, v. 4], and that this grace may overflow the channels of the covenant. (7) It is probable that the decision between the two conflicting lines of thought, the former with unimportance to the vast agreement between the Christian centuries among episcopal Christians, and the other to the life which has been manifested in non-episcopalians, really rests on a profound view deeply embedded in fundamental thought, and are connected with doctrines outside the scope of the present article, and in particular those concerning the whole question of Church authority. See Church, vol. iii. p. 624.

VOL. V.—22

EPISTEMOLOGY

I. Introductory. —Epistemological problems are at present the most interesting subjects of philosophical inquiry. Many books have recently been written on the problem of knowledge, many have been devoted to the history of attempts to solve it. These attempts have been made from various points of view, and there is a wide difference between the solutions offered. With some, Epistemology merely a branch of a particular problem of logical inquiry, for it is thought that the bounds of knowledge, its method, and its validity are given when Logic has found its proper place and is duly acknowledged. But in their case Logic has, like Aonon’s rod, swallowed soul and body, and logical processes are the whole of both knowledge and of reality. With others, knowledge is only a branch of psychological inquiry; and, when Psychology has completed its work, when it has discovered the origin, the growth, the nature, and the result of knowledge—Epistemology is also held to find its place and its justification. In all these cases, and in others which we do not mention, Epistemology is denied to be a separate discipline, its problems are submerged in other inquiries. But it is not possible for these problems to be merged in Logic, in Psychology, or in Metaphysics, as the history of modern philosophy abundantly shows.

It may, however, be granted that the epistemological problem is not the first for the individual mind or for the race. Historically we find that philosophy begins with Metaphysics. What is the form of the universe? What is its origin? What is reality? What is the nature of the soul? What is the body? And what is the relation of the soul to the body? These were the first questions that men asked, and it is possible to maintain that these questions, being only many but contradictory, and they gave rise to the further question: Is the human intellect able to solve such problems? From the historical point of view, Epistemology is the critical reflection on Metaphysics. It is an endeavour to ascertain why and how the contradictory answers which have arisen in metaphysical inquiry have emerged, and whether these are not due to a disregard of the limits of the human mind, and an unwarranted application of cognitive processes to matters beyond its ken.

While it is true that the epistemological problem arises out of the failure of metaphysical inquiry, it is also true that it emerges elsewhere and otherwise as soon as men begin to reflect on knowledge itself. At the outset knowledge is not a problem. Its nature and validity are taken for granted. Men assume nively that they are in contact with reality, that the objects which they know they know surely and immediately, and all that is needed is that the knowledge be verified in practice. They may ask: Have I really knowledge of this? Is this knowledge certain, and objectively true? or rather, since the question of objectivity and subjectivity has not yet arisen, and their thinking and its outcome have never been questioned, they abide in the conviction that the knowledge they possess is adequate and true. At first, both in the individual and in the race, knowledge is not concerned with itself, or with its processes; it is simple, immediate, and direct. It is only when difficulties arise in the practical application of knowledge that the mind begins to reflect on knowledge itself, its origin, its nature, and its limits. The external attitude is first: men look outward; they do not question the reality of common experience, or conceive of themselves as thinking beings at all. They are lost in the object, in the endeavour to master the means whereby they may serve their ends. The question of the self, of themselves as experiencing subjects, and of the bearing of the nature of themselves as the subjects which make knowledge does not arise until reflection has well begun. Apart from this, there have emerged, between Logic, Psychology, Metaphysics, and the Theory of Knowledge, there is no doubt that at the basis of all knowledge there is first the experience which is more or less indefinite. For
experience does not begin with a recognition of the distinctions whose subsequent reflection finds within it. At first it is vague and indefinite. The elements within it are not distinguished. These distinctions, in the work of the mind, we find of within experience which we call feeling, thought, and volition. These we discover to be ultimate, that is, we cannot identify thought with feeling or volition; hence all three are present in every experience. Similarly, we find in the sphere of knowledge that there are many elements which can be distinguished, and processes which can be considered in abstraction from the others—sensation, perception, imagination, conception, general laws, and so on; so that we may regard sensations becoming associated together, and by the apperceptive activity of the mind, along into images; perceptual progresses becoming perceptions by the same activity as increasing images; images becoming conceptions; and conceptions being worked up till they become ideas (Begriffe). Ideas in their turn give rise to newer and wider judgments, till the whole process is extended and placed in sure and definite relation with reality. Such is the kind of picture sometimes painted of the process and outcome of knowledge on its subject, or the way in which subjective objects interrelate with the subjective evolution, being bound together in order, so that the subjective and objective are only opposite sides of reality.

But many questions arise, such as the relation of sensation to perception, of perception to conception, of conception to judgment and to idea, and these questions are not yet answered. One fundamental question is, Can we consider any of these mental activities without involving all the others? Does not the simplest intellectual experience involve the whole activity of the mind, and is not the whole experience of the rational being implicitly present in the first rudimentary experience? When we concentrate attention on, say, perception, is not the rational activity of the perceiving subject involved in every perception?

2. Solidity of mental movements. Leaving these questions unanswered for the present, let us look for a little at the first abstraction which we make when we separate the cognitive activities from the volitions and from the feeling experience of the have a real Epistemology when we take the cognitive activities by themselves, and separate them from the other experiences inseparably bound up with them.

In knowledge, the knower appears to himself as an active and sensing being. Of the existence of this by himself and of his being such a being, he knows himself, and of these feelings we call sensations, which are in him, but which he neverthelecss attributes to the objects as their external cause. The knower is, above all, an intelligent will. He knows his object; the thing known, as he acts upon it, moves it, moulds it, makes or destroys or modifies it; and is himself moved, moulded, or otherwise affected by it. Without intellect there is no knowledge; without feeling there is no knowledge; without doing and experiencing the effects upon ourselves and our object, of this doing, there is no knowledge. And yet these elements, or facts, are all given together in the unity of the act or process of cognition (Ladd, Knowledge, Life, and Reality, p. 6).

It would seem, then, that Epistemology must be careful lest, in dealing with its own problems, it turn the fruit of its labor into a barren classification of the solutions untrue or inadequate. It must not proceed on the supposition that a purely cognitive experience is possible. It must accept from Psychology the fact that it establishes regarding the complexity of every act of cognition, and the further fact that not cognition but conation is the fundamental element in experience. It cannot investigate of itself, or inquire into the origin of experience, or go back to the first beginning of cognition. No science can go back to its own origin. Nor is there any science of origin. We cannot recall the beginning of our experience, nor can we say what experience is the simplest possible. But we can say that all experience is process. What we can discern as we look back on our experience is the past experience: we find of change felt and experienced—and also processes in which there is continuous interchange. There seem to be interchanges between external happenings and such feelings; all three are present in every experience. We find in the sphere of knowledge that there are many elements which can be distinguished, and processes which can be considered in abstraction from the others—sensation, perception, imagination, conception, general laws, and so on; so that we may regard sensations becoming associated together, and by the apperceptive activity of the mind, along into images; perceptual progresses becoming perceptions by the same activity as increasing images; images becoming conceptions; and conceptions being worked up till they become ideas (Begriffe). Ideas in their turn give rise to newer and wider judgments, till the whole process is extended and placed in sure and definite relation with reality. Such is the kind of picture sometimes painted of the process and outcome of knowledge on its subject, or the way in which subjective objects interrelate with the subjective evolution, being bound together in order, so that the subjective and objective are only opposite sides of reality.

But many questions arise, such as the relation of sensation to perception, of perception to conception, of conception to judgment and to idea, and these questions are not yet answered. One fundamental question is, Can we consider any of these mental activities without involving all the others? Does not the simplest intellectual experience involve the whole activity of the mind, and is not the whole experience of the rational being implicitly present in the first rudimentary experience? When we concentrate attention on, say, perception, is not the rational activity of the perceiving subject involved in every perception?

2. Solidity of mental movements. Leaving these questions unanswered for the present, let us look for a little at the first abstraction which we make when we separate the cognitive activities from the volitions and from the feeling experience of the have a real Epistemology when we take the cognitive activities by themselves, and separate them from the other experiences inseparably bound up with them.

In knowledge, the knower appears to himself as an active and sensing being. Of the existence of this by himself and of his being such a being, he knows himself, and of these feelings we call sensations, which are in him, but which he neverthelecss attributes to the objects as their external cause. The knower is, above all, an intelligent will. He knows his object; the thing known, as he acts upon it, moves it, moulds it, makes or destroys or modifies it; and is himself moved, moulded, or otherwise affected by it. Without intellect there is no knowledge; without feeling there is no knowledge; without doing and experiencing the effects upon ourselves and our object, of this doing, there is no knowledge. And yet these elements, or facts, are all given together in the unity of the act or process of cognition (Ladd, Knowledge, Life, and Reality, p. 6).

It would seem, then, that Epistemology must be careful lest, in dealing with its own problems, it turn the fruit of its labor into a barren classification of the solutions untrue or inadequate. It must not proceed on the supposition that a purely cognitive experience is possible. It must accept from Psychology the fact that it establishes regarding the complexity of every act of cognition, and the further fact that not cognition but conation is the fundamental element in experience. It cannot investigate of itself, or inquire into the origin of experience, or go back to the first beginning of cognition. No science can go back to its own origin. Nor is there any science of origin. We cannot recall the beginning of our experience, nor can we say what experience is the simplest possible. But we can say that all experience is process. What we can discern as we look back on our experience is the past experience: we find of change felt and experienced—and also processes in which there is continuous interchange. There seem to be interchanges between external happenings and such feelings; all three are present in every experience. We find in the sphere of knowledge that there are many elements which can be distinguished, and processes which can be considered in abstraction from the others—sensation, perception, imagination, conception, general laws, and so on; so that we may regard sensations becoming associated together, and by the apperceptive activity of the mind, along into images; perceptual progresses becoming perceptions by the same activity as increasing images; images becoming conceptions; and conceptions being worked up till they become ideas (Begriffe). Ideas in their turn give rise to newer and wider judgments, till the whole process is extended and placed in sure and definite relation with reality. Such is the kind of picture sometimes painted of the process and outcome of knowledge on its subject, or the way in which subjective objects interrelate with the subjective evolution, being bound together in order, so that the subjective and objective are only opposite sides of reality.

But many questions arise, such as the relation of sensation to perception, of perception to conception, of conception to judgment and to idea, and these questions are not yet answered. One fundamental question is, Can we consider any of these mental activities without involving all the others? Does not the simplest intellectual experience involve the whole activity of the mind, and is not the whole experience of the rational being implicitly present in the first rudimentary experience? When we concentrate attention on, say, perception, is not the rational activity of the perceiving subject involved in every perception?

2. Solidity of mental movements. Leaving these questions unanswered for the present, let us look for a little at the first abstraction which we make when we separate the cognitive activities from the volitions and from the feeling experience of the have a real Epistemology when we take the cognitive activities by themselves, and separate them from the other experiences inseparably bound up with them.

In knowledge, the knower appears to himself as an active and sensing being. Of the existence of this by himself and of his being such a being, he knows himself, and of these feelings we call sensations, which are in him, but which he neverthelecss attributes to the objects as their external cause. The knower is, above all, an intelligent will. He knows his object; the thing known, as he acts upon it, moves it, moulds it, makes or destroys or modifies it; and is himself moved, moulded, or otherwise affected by it. Without intellect there is no knowledge; without feeling there is no knowledge; without doing and experiencing the effects upon ourselves and our object, of this doing, there is no knowledge. And yet these elements, or facts, are all given together in the unity of the act or process of cognition (Ladd, Knowledge, Life, and Reality, p. 6).

It would seem, then, that Epistemology must be careful lest, in dealing with its own problems, it turn the fruit of its labor into a barren classification of the solutions untrue or inadequate. It must not proceed on the supposition that a purely cognitive experience is possible. It must accept from Psychology the fact that it establishes regarding the complexity of every act of cognition, and the further fact that not cognition but conation is the fundamental element in experience. It cannot investigate of itself, or inquire into the origin of experience, or go back to the first beginning of cognition. No science can go back to its own origin. Nor is there any science of origin.
and each must have its place in a systematic exposition of the activity of consciousness. On the other hand, both knowledge and will must be considered as parts of the same fundamental feeling which arouses attention and prompts to endeavour, with a view to an increase of pleasurable feeling, or an avoidance of an experience which is painful. Such is the primary feel, the feeling which is the starting-point of all action, whether in the region of thought or of action.

It is the signal to awareness, it arouses the attention, it inspires the action, it prompts towards the realization of a fuller experience. According as we look at the matter from one or another point of view, we shall have in the first place a world of truth or fact, in the second place a world of ideals more or less realized, and in the third place a world of appreciations, in which values and worths are the main feature. These three worlds ought to be one, and the present endeavour of philosophy is to make them one; and thus the worlds set forth in their exclusiveness by idealists, empiricists, and pragmatists must finally appear as aspects of that real world to construct which is the ultimate aim of philosophy.

While we thus caution ourselves that an abstract Epistemology must in its very nature be one-sided, and must ever be held in control by the other aspects of consciousness, it is yet a legitimate aim to consider knowledge in itself, apart from those important accessories, and then to round up with it as a matter of fact. It is legitimate to consider the operations of Logic apart from Psychology, and also to deal with problems of Metaphysics by themselves. But each of these involves the others, and every attempt to conduct to the others help and guidance. So, abstract Epistemology, or the discussion of the nature of knowledge, its limits, and its validity, may so far be considered in separation from the other philosophical sciences; yet the conclusions to be drawn from the discussion are themselves abstract, and are not forthwith to be regarded as true and adequate for the description of concrete reality.

3. Cognition as 'Awareness'.—Let us try then to get back to the simplest possible cognitive position. Even this will have elements in it which we shall be obliged to neglect, if we are to have only a cognitive position to attend to. When we seek the simplest possible cognitive position, we are not seeking the origin of knowledge. We have already said—and it is a commonplace—that inquiry into origin is not in order when we are considering the validity of a position. But we may ask, What is the fact about knowledge which involves the latter in its most elementary form? We obtain knowledge in its simplest form when we go back to the most elementary description of consciousness which we possess. It is simply that of awareness, or of simple apprehension. We may neglect for the moment the fact that awareness has in it a voluntary and a feeling element, and concentrate our attention on the fact that it has a cognitive element. Both Locke and Kant agree that all knowledge begins with experience, and from this there is no dissent on the part of any philosopher. What is the simplest form of experience, or the ultimate datum from which knowledge starts? Have we any state of mind which may, for this purpose, be regarded as ultimate, which, itself unexplained, may afford the explanation of everything else? The ultimate fact seems to be, not a stimulus of any kind, or a dependence of a state of consciousness on any sense complex, but an immediate presence to consciousness. What I feel when I see, when I hear, when I taste, when I see, is not further evidence of their existence than the fact that I feel, taste, or see them. I am aware of them, and this awareness is a primary act of knowledge. It depends on nothing but itself.

Here, if anywhere, we have an act of knowledge seemingly concerned with present reality, and with that alone. It is to be remarked again, by considering the problem from the point of view of the present study, the act of knowledge from the other elements in the complex state of consciousness which we call awareness. When we speak of knowing, of willing, of perceiving, of thinking, of attention, we mean the normal state of consciousness which usually involves all three. Pure thought, pure feeling, pure will, are abstractions, not names of any concrete reality. Awareness is a state of consciousness which may stress, and it may concentrate attention on the cognitive aspect of awareness. We may from this point of view name it apprehension, which is the simplest and the most ultimate of all cognitive acts. At the same time, it is contended that even the simplest state of consciousness has a cognitive aspect. The consciousness of the present is itself an act of knowledge. If at this stage we may use language more applicable to a subsequent stage of the argument, a state of consciousness is the state of any conscious subject, and it has an object. But, it may be said, is every conscious state one which may be described as knowledge? Is it not that, with the exception of the statement that knowledge, feeling, and volition are not to be derived from one another, that they are primary and undervived? It may be replied that the nature of intelligence has peculiarities inseparable from its very existence, which must be described from attributes peculiar to itself. On the other hand, it may be justly contended that every state of feeling has its cognitive aspect, that every state of knowledge has its feeling tone, and that every volition has its emotional and cognitive aspect. Still we may concentrate attention on the cognitive aspect which is present in every mental state. Awareness is mainly cognitive, even if it be also volitional and emotional. This awareness at its simplest implies the consciousness of a content present to us, and an assurance that we are so far in possession of a knowledge of it. It seems to be the simplest of all the acts of knowledge, and cannot be derived from anything more simple.

We are aware that the last statement is deeply contentious, and one which is attacked fiercely and from different standpoints. Idealism contends that the simplest act of knowledge is constituted by thought-relation, and we cannot have an act of knowledge without relation. But we may ask, What is the fact about knowledge which involves the latter in its most elementary form? We obtain knowledge in its simplest form when we go back to the most elementary description of consciousness which we possess. It is simply that of awareness, or of simple apprehension. We may neglect for the moment the fact that awareness has in it a voluntary and a feeling element, and concentrate our attention on the fact that it has a cognitive element. Both Locke and Kant agree that all knowledge begins with experience, and from this there is no dissent on the part of any philosopher. What is the simplest form of experience, or the ultimate datum from which knowledge starts? Have we any state of mind which may, for this purpose, be regarded as ultimate, which, itself unexplained, may afford the explanation of everything else? The ultimate fact seems to be, not a stimulus of any kind, or a dependence of a state of consciousness on any sense complex, but an immediate presence to consciousness. What I feel when I see, when I hear, when I taste, when I see, is not further evidence of their existence than the fact that I feel, taste, or see them. I am aware of them, and this awareness is a primary act of knowledge. It depends on nothing but itself.
the one hand, or all the facts which are formed into the ordered knowledge which we call by the name of Logic, Psychology, or Metaphysics, on the other. Awareness is the construction of all the systems, and it is well to take it as the starting-point of any theory of knowledge which can in any way be adequate to the fact.

4. Contents of knowledge.—Taking, then, this attitude of awareness as the starting-point for the discussion of knowledge, what do we find? The consciousness of a here and now, with a content more or less defined. This is the irreducible minimum, the ultimate datum of all experience. Apart from all subtlety of argument and all attempts at explanation, this is sure. There is a present experience, and from immediate experience every other kind of knowledge must start. The simplest form of immediate experience is just this awareness. No doubt the latter is a property of every form of life. It seems to lie at the bottom of adaptation, and may be considered as a characteristic of the environment, and, before organic life which helps an organism to adapt itself to its environment, as life becomes more organized, awareness is there in increasing measure. Organic habits and instincts are partly in this way, and in higher organizations they are the means by which the organism adapts itself to its environment. It is a matter of observation that every organism has a working knowledge of Nature, and is so far aware of the hindrances and helps towards its self-preservation. This is a characteristic of all life, and without it life would be impossible. How far adaptation to environment may be regarded as something which flows out of intelligence on the part of life is a question which does not admit of any definite answer; but the fact of adaptation is undoubted. Yet in a self-conscious being adaptation to environment must in the long run become a conscious process, and intelligent foresight will take the place of instinctive adaptation. At the same time it must be conceded that adaptation to environment, even in a being implicitly self-conscious, consists in adjustments common to men and the lower organisms. Men are practising science even before they recognize it. Even the tracks made by sheep up a hill-side are wonderfully engineered, taking the line of least resistance. The people of a village who have never heard of Euclid, in making their paths through the fields, act on the principle that the two sides of a triangle are longer than the third side.

We may recognize, then, that organic habits and instincts have a significance for knowledge, and that knowledge of a kind has made some progress before reflexion begins, or at least reflexion in a rudimentary condition. Insects, beliefs, habits, are part of that original endowment of man in virtue of which he is able to make himself at home in the world in which he has to live. These habits and beliefs develop in man in interaction with the environment of his daily life. Organic habits and beliefs, increased by the experience of many generations handed down from father to son and recorded in language, may grow to so great an extent that, in virtue of them, men may learn to obtain control over the world so as to make life more possible. This is the case when we begin to seek to understand the mystery of knowledge. Analyzing this complex body of knowledge with which an individual is acquainted, we see that so much is due to the primary endowment of the individual, which enables him to make himself at home in the world in which he is to dwell. We may not exactly measure the extent and limits of this primary disposition, or inquire how much of it is due to traditional lore and how much to the construction of its own, but it is not possible for one to tell how much is due to nature and how much to nurture. But, at all events, for every individual born into this world, there may be a certain portion of knowledge which enables him to start, by no means ill-furnished, on the work of living. No doubt much of this knowledge is uncritical, unsifted, and much of it must be cast aside as untrustworthy, but it is there, a natural knowledge, which is an individual must start with.

Coming back, then, to awareness as the simplest datum of a possible knowledge, let us ask what is implied by it. Of course the two elements which are combined in every act of knowledge are present here in their most rudimentary form. There is the attitude of the mind which is aware, and the object of which it is aware. What the nature of the object is we may be permitted to express, but that it is there, and may be its own feeling of pleasure or of pain; it may be the change from one state to another; it may be an impression from without; in every case there is awareness, and in every case there is the awareness itself, considered simply as an attitude of the subject. This awareness, thus simply considered, gives us the starting-point of knowledge. It passes through the various grades of experience, until, as the outcome of growing experience and of reflexion on itself, it becomes the full-orbed distinction which we call the distinction between subject and object, which is implied in all human knowledge. The subject has its own nature, characteristics, modes of action, its rules, its principles, and its laws which condition all knowledge. Objects have also their own characteristics, their own natures, and their own correspondences. So all knowledge is conditioned by the knowing subject and by the objects which are known. The two are in relation to each other, and the whole question is as to what is the relation, or what are the relations, of subject and object within the world of knowledge. Are we to think of subject and object as a distinction which is ontological? Are we to think of this distinction as the same which we name "self" and "not-self"? Are we to place the two under the law of causality, and name the one "cause" and the other "effect"? Are we to look at the object as the governing element in the formation of knowledge? Or, are we to look at the subject as the making of this knowledge, and to see knowledge in consistency therewith? All these questions confront us as we begin to wrestle with the epistemological problem, and the history of philosophy may be called the history of the attempt to answer them. Other questions also arise. There is the question of the possibility of knowledge, and of the various attitudes assumed thereto on the part of the human spirit. These attitudes are, or have been, mainly three. There is the attitude called scepticism, which denies the possibility of knowledge, and which has appeared in various relations in the history of human thought. There is the attitude of dogmatism; and, finally, there is criticism, or an examination of the principles which are implied in the possibility of knowledge both on the side of the subject and on that of the object. All these attitudes must obtain an admission in a discussion of knowledge, its possibility, and its existence as fact. Further, there are questions as to the relation of knowledge to the object that is known. Is the object of knowledge independent of the fact that it is known? Is knowledge an essential quality of things? And, if the object is knowable, what is the machinery by which it is knowable? Is
knowledge in immediate relative relation to its object, or is it representative?

It is clearly the object of the question in this article to give anything like an adequate account of the various attitudes of the mind towards the epistemological problem, or to institute an inquiry into the characteristic features of scepticism, dogmatism, or criticism. It is equally impossible to set forth the various theories which have been involved in history regarding the relation of thought towards its object, or to give a full and complete view of realism, idealism, or the theories of knowledge contained under these or similar names. To deal with empiricism fully would be to give a complete account of English philosophy from Hobbes down to J. S. Mill, with a glance at the philosophy of Shadworth Hodgson.

One main characteristic of this philosophy is that it regards the object as the determining element in knowledge, and looks at the relation of object to subject as one of causality. Nor can we give a full account of idealistic conceptions of experience, whether subjective or objective, for that would be to attempt to write the history of philosophy since Locke invented the new section made to thought by the splendid achievements of Greece.

We must travel by a shorter route, which will not leave the above questions without an answer. We shall look at them first from the point of view of objective knowledge, and next under the subject as one of causality. For we must regard the subjective, or, if it is valid, must correspond with reality. Under the former question, the object is the subject, and, as, less knowledge, if it is valid, must correspond with reality. Under the latter heading, all questions regarding the physical relation to subject, and, as, less knowledge, if it is valid, must correspond with reality. Under the latter heading, all questions regarding the physical relation to subject, and, as, less knowledge, if it is valid, must correspond with reality.

5. Epistemology and sense-experience. — Starting from the concrete fact of our experience, which we consider to be a primary fact of our mental life—the awareness of a content—we must seek to show how this really involves, or contains implicitly, what is evolved into the structures of Metaphysics, Psychology, Logic, and Epistemology. All the mental sciences spring out of this fact of awareness—a fact of which the simplest analysis gives position, discrimination, and comparison. These are not independent acts or processes, nor can they be regarded as constituting the fact of awareness. They are simply aspects of this fact, and are not before it in point of time. They are in themselves abstractions, and are to be viewed as strictly subordinate to the reality out of which they spring, and apart from which they have no meaning. On the other hand, the simplest facts of mind, even sense-impressions and ideas, cannot be facts of mind at all unless they have in them, implicitly at least, the rudimentary forms of those features of distinction and relation which have become articulated in the form in which we find our highest thought. To make explicit what is involved in the simplest form of experience is the function of philosophy.

Here we are at the parting of the ways; and, according as we take the one path or the other,
opposition. On the one side there is extension, and on the other there is feeling or a state of consciousness; and how are these to be reconciled? The objects which affect us seem to be out there beyond ourselves; and we really ask what they are like. We need not recall the story so picturequely written in the history of human thought, of how the relation of the mind to its objects, as this is set forth in the sense-experience, has culminated in Scepticism on the one hand and Solipsism on the other. Doubt as to the very existence of an external world, followed by doubt as to the existence of any external world, has arisen from the attempt to make sense-experience the whole experience of man. Yet sense-experience is a fact, and has to be taken into account on any theory of knowledge. The characteristic quality of it is the customary immediate existence of a consciousness content. 'I see,' 'I hear,' 'I feel,' 'I taste,' and so on, simply give, so far as sense is concerned, the present experience and nothing more. This,' that,' here,' in,' and the like which have been the presence of consciousness of a sense quality. No doubt, there is a difference between these indications—here is one thing, now is another—but they are only variations of the same kind of conscious life. Taine points out the various points of view that all that has been evolved by conscious activity in elaboration of it in former experience, and what is left for pure perception is only an experience of a 'here' and 'now.' What is perceived is not an articulated object, say, a horse, with all the characteristic marks of a horse as it is to a scientific mind, or even to a practical mind, with all the implications of a gathered knowledge; it is only a difference of colour which is presented to sense. This is commonplace ever since Berkeley's classic analysis of the nature of vision—an analysis which is true of all our interpretations of sense-experience. When we strip sense-experience bare of all that is added to it by interpretation, we have only a present content of consciousness—in practical experience it is not possible to make so drastic an abstraction.

On the other hand, it is vain to say that the nature of things is to be perceived. The statement Ex hoc est percipiet is without meaning unless we add to bare perception those perceptual judgments by which a mere presentation of difference of colour and shape becomes a judgment of distance, of character, and so on. But, when we do so, we have come to a perception which is charged with the burden of all the experience of a long experience, functioned by interpretations gathered by a mind in contact with reality, and which has formed judgments in accordance with its own nature and the nature of things. It has been customary to refer to perception as the standard and norm of knowledge. But, when this is done, we have passed from perception as simple sense-experience, and have introduced into it all the secretions which have been gathered from the action of the mind in interaction with the objects of its experience. Perceptual presentation (to use the phrase of Ward) implies more than can be justified from sense-experience. It is possible, indeed, on the one hand to arrive at something like a universal. That universal is precisely what Ward calls a 'presentational continuum'; or, as the same thing is expressed by Kant, 'the universal is just the continuity of the process which makes up the life-history of immediate sense-experience.' This may be briefly described, except in distinguished phases or parts, as a purely perceptual judgment which constitutes the identity between them. The incessant change of sense-life is due to its being a mere presentation of the same simple form of existence, is due, in fact, to the unceasing variations of the content: a 'this' can equally well become a 'that,' a 'now' a 'then,' and so on.
of the contents of consciousness. But there is another order, in which we seek to establish not contingency but necessity, not accidental conjunction but inner connexion. Over against the uncontrolled flow of sense-presentations, and the unregulated flow of the intellectual function which we place the exercise of a mental activity of our own. We seek to place together the things which we think, belong together. We may recognize that they belong together, not because they have happened to come together in some passing phase of our experience, but because they are fixed in changeless relations.

The properties of a circle belong together, and cannot be separated without destroying the notion of a circle. Thus, science is the attempt to ascertain the things and qualities which belong together, and to replace a contingent and accidental order by one that is fixed and connected. Nor is the activity of thought limited merely to the recognition of the things which belong together in the objective order of the world—whether that order is fixed by the peculiar constitution of the actual world to be ascertained by experiment and observation, or is one whose being as (as in pure mathematics) constructed solely by the mind. For mind is creative. In the normative sciences there is not merely recognition of things which belong together, but the being of things that some things shall belong together. In the one case, the self is the discoverer and the interpreter of an order which it has not instituted; in the other case, it is a law-maker, determining both the end which it has and the means by which it is to be accomplished. Here it is possible to 'give to airy nothing a local habitation and a name.' In this sphere we certainly find the activity of the subject, the expression of self and of its own purpose, where the train of thought is dominated by a purpose, and the means are arranged by which a new meaning is given to the material so arranged as to fulfil a purpose. As Adamson has remarked: 'Taken in the mass, our thinking appears (1) as a subjective activity; (2) as the expression of some purpose, and therefore as self-conscious; (3) as relating together the materials supplied by presentations and representations' (op. cit. II. 258).

Leaving the discussion of the first two characteristics of thinking for the moment, we shall dwell on the third, namely, that of relating together materials as available for presentations. We have already seen that the aim of thinking is to bring together what belongs together. Now, it is clear that the presentational continuum does not bring together what belongs together; it presents experience as it happens to come. It, therefore, gives no principle of rational connection. Nor do the happenings which are merely associated together supply the linkage which we are in search of. What are the criteria of things which belong together? How are they to be related? In the first place, we must consider the rational principles of the mind which links them together, and, in the second place, according to the native connexions of the things themselves. But in every product of knowledge these are together. True, in dealing with the two factors of knowledge, we may neglect one or other for the sake of convenience; but we must always try to restore the wholeness of what we have thus disrupted for the time.

7. The conceptual and perceptual order. — In his later works, as indeed also in the 'Thought,' W. James says, with all the emphasis of italics: 'The intellectual life of man consists almost wholly in his substitution of a conceptual order for the perceptual order in terms of which his experience comes.' (Some Problems of Philosophy, p. 51). And on the previous page he says: 'If my reader can succeed in abstracting from all conceptual interpretation and lapse back into his immediate sensible life, ... he will find it to be what some one has called a big blooming buzzing confusion, as free from contradiction in its "much-at-onceness" as it is all alive and every-thing and evidently the semblance of the fineness which we expect from its author. But is it true or adequate? The sensible life is, so far, an ordered life. Impressions which come to us through the senses are filtered as they come. Eye, ear, and all the other senses select out of the big blooming buzzing confusion' those waves of sight and sound which can be transformed into sensations; and, even at the very beginning, the eye does not see sound, or the ear appreciate light. But the eye does have a picture of a coloured something, which is not confused, or blooming, or buzzing. At the outset, therefore, there is not confusion, but something which is already full of order; sense-impressions are definite and ordered, and the work of science is to ascertain, define, and describe the order.

But can it be fairly said that the order in which our experience originally comes is the perceptual order? Or, if it is, can we separate thus abruptly the perceptual from the conceptual order? Can we have percepts by ourselves? James evidently does not think that the perceptual order offers constantly to the perceptual order as the norm and criterion of valid knowledge. To us, on the other hand, a percept is as much the work of thought as a concept. Even sensation itself, in so far as it has a meaning, is a work of thought.

8. Thought and reality. — It may be well to guard ourselves at this stage against a possible misunderstanding, which might arise from speaking in separate terms of thought and reality, and the relation between them. We do not mean by Epistemology, or the theory of cognition, an examination of the nature of knowledge as something apart from the reality which is then taken as an external standard. Rather we regard the treatment of thought, and the analysis of reality itself, as the attempt to reach a world of reality considered as a system of ideas, which may actually become the world of reality. It is our interpretation of reality, and is part of the reality which is constructed by intelligence in response to the whole universe of experience. The environment of thought is the hypothetical world of experience as a possible world of action; it is the whole world of experience, which is to be articulated into system, and made such as to answer to our intelligence. Not, indeed, that we may ever hope to transfer all reality into our system of thought, but the solution of the thinker is the reality he can command and use. Yet our system of thought falls far short of reality. For, while the world which each mind constructs for itself out of its own experience is the world of which it is the centre, there must be a world common to all intelligences, or, in other words, a higher experience than ours, which in its organized state is the supreme world of reality. All the worlds which seem separate and unconnected, as constructed by each for himself, have common ground and purpose in that experience which is higher and deeper than ours. In this view, reality is the dependent of our intelligence, and something which far transcends our experience. Yet our judgment and its outcome must be held to be an element in that higher experience, and the world we construct is a part of the world that is what it is for the higher experience.

As, on the one hand, reality must be held to transcend the final worlds which knowledge builds out of our experience comes. On the other hand, there is something given before thought can begin its constructive work. Our immediate feeling has a
content of its own, something which is there in a sort of unity and simplicity which we have not made, but only experience. It is a mode of con-
tact with a world that is not yet conditioned in its
elements. We do not confer on that immediate
direct experience either its immediacy or its individ-
uality; we experience it in its unity. The first step of
the action of thought on the immediate feeling is
to break up its formal unity, to distinguish ele-
ments in it, and to pass beyond it into another
kind of unity, namely, that which is conferred by
thought. But to restore the lost unity is very
difficult, and the whole task of philosophy is to
restore that unity which is first given in feeling,
disrupted by thought, and made diverse by the
analysis which thought has performed upon it.
Thus, in the end, we strive to attain, by the exer-
cise of discursive thought, to something like intu-
ition of unity, the unity of a whole, what life started
with in that intuition of unity which is the charac-
teristic of our feeling life. For the mind, in its
contingency, in its dependence on the world, finds
that it passes its strength either to attain to intuition
which envisages the world as a whole—that is only
for a higher experience than ours—or to rest con-
tent with the former possibility of mere experi-
ence. It is the province of Logic (p. 27) to set forth
the categories of mind, or the machinery by which it
does its work, as it is the province of Psychology
to set forth cognition considered as a merely mental
process. It is the part of Epistemology to accept
from the sister sciences the description of the pro-
cess of knowledge considered as an internal fact,
and to accept from Logic the deduction of the
categories, their inter-relations, and their worth
as instruments for the organization of knowledge.
We need not, therefore, dwell here on the signifi-
cance of space and time as the forms within which
all our intuitions take place. Nor need we inquire
into the subjectivity or objectivity of space and
time. Sufficient for our purpose is the fact that
all our mental life is conditioned by these forms;
at least all our sense-presentations are of such a
case as never to transcend the boundaries of space
and time. Into the origin and nature of our con-
ceptions of these we are not called to enter. It is
sufficient to say that they are forms into which
mind gathers its experiences, and that it is con-
strained to regard all things as things in one space,
and all events as happening in one time. In these
forms it finds the first possibility of a unity of
experience.

9. Thought and self.—The notion of space, then,
dominates all our thinking with regard to things,
and time does the same with regard to the inner
life. It is another matter, however, with what we
ask ourselves how the notion of time governs all the
phenomena of the inner life. Can we in this rela-
tion do without the supposition that the very possi-
bility of time depends on the fact that there is
a continuity of the thinking subject to which the
events that happen to it, or in it, are referred? Is
not the permanence of the thinking subject the
condition of the possibility of the notion of time?
We are aware that this is a keenly contested
question.

*It is a fact recognized explicitly or implicitly by every one,
that the most striking and fundamentally changing experiences that
enter into the life history of an individual mind are in some
sense owned by a self or ego which remains one and the same
throughout his various vicissitudes. We begin to inquire into the
precise nature of the unity and identity ascribed to the self,
and the principles by which its experiences belong to it,
we are confronted with a fundamental enigma of 'experience.'
On the one hand, it is maintained that, just as the unity of a
thought, or of a melody, or of an organism consists merely in the
special mode in which its parts are connected and corre-
bated so as to form a specific kind of complex, so the unity of
what we call an individual mind consists merely in the pecu-
liarity in which we call its experiences are united with each
other. On this view, when we say that a desire is some one's
desire, we mean that it colors and is conditioned in the
same way by the experiences of others into a connected totality of experiences having a certain
sort of unity and continuity which can belong to
experiences only, and not to mere phenomena or
merely the manifold experiences through their union with each
other form a single whole.

10. Judgment the category of thought.—This
order, which I do not make but discover, is one
which I am able to discover because it is in itself
in relation to my intelligence, and can be con-
strued by me in accordance with those principles
on which I act as an intelligent being. These
rational principles are implicit in every act of
judgment, and the rational principles of my judg-
ment are found to be at work in the order which I
discover. Because I do discover, I do not find it
the business of Logic to set forth. For our purpose
it is necessary to refer to only one of these categories,
that is, that of Judgment, which is the form which
thought uses in the apprehension of truth. Logic is coming more and more to recognize judgment as the one category which involves all other categories in its operation, and in its discussion of logical principles the doctrine of the judgment holds the foremost place. We refer to the treatise on Logic of the 

Dr. von Hart's Logic in illustration. The various forms of the judgment may be found in treatises on Logic, and need not be detailed here. But the fundamental conditions of the judgment are fundamental conditions of thought, and in every form of it involves a relation to the thinking self or to the unity of the mental subject. This holds good even on the hypothesis of Stout, as quoted above. It is the self that judges, and it judges in consistency with the totality of its rational experience, or at least it ought to do so. In the second place its judgments must be consistent with each other; in other words, all judgments must have regard to the law of identity and contradiction. If we are to have a constant and consistent meaning, we must think according to that law. Again, our judgment must have regard to the fact of connexions among the objects of thought. The irresistible belief that things are connected, and that the connexions may be discovered, lies at the basis of every judgment. What the connexion is the mind may not know, as is shown in the possibility of discovering but that such a connexion exists is a conviction without which there can be no judgment.

In dealing with the judgment in its various forms and applications, we ought to remember that there is one element common to all, which no judgment can explicitly set forth. In all judgments, reference is explicitly or implicitly to the subject which judges. It is the subject which supposes, affirms, judges. The subject may say itself to be the object of reflection. Thought itself may be the object of thought, and it may be reflected on till all its implications become explicit, and its modes of acting may be articulately set forth. But that does not exhaust the meaning of the subject. Is thought capable of exhausting in its own way all the meanings which are implied in the function of thought? But, the more we do so, the more is the reference to a subject a persistent relation. Exhusted itself by an object and thought as much as we please, yet at the end the self persists as the final condition under which knowledge of the self as object is possible. The meaning of self or subject as capable of statement as object of thought does not exhaust its substantive meaning.

The great aims of philosophers have been, on the one hand, to show that the self as "subject" is nothing but the self as "object"; and, on the other hand, to show that the self as "subject" is only a sort of restatement of the self as subject; or, yet again, to show that the self as object arises as a sort of cognitive screen or blind on the self as subject, so that the latter is hopelessly obscured or hidden—the subject disappearing in the realm of the "unknowable," or the "thing-in-itself." (Sadewa, Thought and Things, or Genése Logique, I. 267.)

In this relation we may quote from the essay of Stout (L.c., p. 8):

"The self is the same self, inasmuch as throughout the process of such awareness of the desire as is the same, and inasmuch as it is aware of the object attained as identical with the object perceived. The best example, however, is supplied by the continuity of attention. In the condition when it is thereby directed to the same total object from varying points of view, so as to distinguish successively its different partial features, aspects, and relations. For instance, in considering a flower as a flower, as a plant, as a flower as classification as a natural species, the stem, root, and leaf, all features may be successively distinguished. The total object is a flower as a species—a whole flower of the whole flower of the whole flower of the whole flower; science so far as this may be relevant to the classification. The parts of the total object as total object are successively discriminated, and in their turn cease to be discriminated, but there is continuity of attention, inasmuch as the partial features successively acquired are throughout uniformly apprehended as being partial features of the same complex entity.

As a description of the work done by the mind in the classification of a flower, this leaves nothing to be desired. But to speak of attention as continuous because it is throughout directed to the same object seems a rather inadequate account of the processes of thought. For, if attention does describe the attitude of attention as continuous; for, as a matter of fact, the process of attention by which the flower is classified may not be continuous; it may be distributed over many times, and in any segment of it may be resumed and resumed after an interval. But the main point is that the process of attention as described by Stout is attended by a consciousness of the strain of attention. I may be absorbed in the attempt to classify the flower, but on reflection I am conscious that I was attending all the time. In fact, all the objective meanings—even those in which the subject or thought itself have been thought of—are over against a subject-self. The self is not to be merged in its own products, and the unity of the object seems to be inadequate to produce that unity of the subject which is the presupposition of knowledge. For, if attention ever work out the fact of a subject over against all the objects of thought or objective meanings, as the very ground of the unity of the subject, it is the unity of thought to work out. The first condition of the possibility of knowledge is just this reference to a subject, which becomes, in the process of working out the kingdom of truth, a self-conscious subject to which all the objects of knowledge finally assume the form of a coherent world of truth. In this ideal goal, truth and fact become one; and the content of mind, articulated into system, becomes the content of reality as well. But such a goal is never attained by the finite mind; it remains an ideal, but one that influences and shapes all our lesser and more partial systems of actual knowledge. So, the real question becomes not how to attain to the notion of the unity of the subject from the object, as Stout really does, or to attain the unity of the object world from the subject, but how to construct an object as related unities in a wider unity which transcends and yet contains both. Are not subject and object subsumed in the wider world of experience? Are they not really given in the earliest experience possible to a subject which finally becomes this subject? Are not both factors really present in the first cognitive experience, which we have already found to be present even in the sense-life? No doubt in our reflective analysis we place the subject over against the object and the object over against the subject, and make their relation to each other one of utter opposition; yet the relation of opposition is a relation after all, and even in opposition the two are really held together in the unity of one experience.

II. Intelligibility of the objects of knowledge.—In any case, there is a conformity between cognition and its objects. What is the meaning of that conformity? Are we to say that cognition must conform to objects, or are we to say that objects must conform to cognition? This is the experiment of Kant, who maintains that the assumption that cognition must conform to objects had led to scepticism, asked what would be the outcome of the supposition that objects should conform to cognition. His question and the answer to it were epoch-making in the history of thought, and every theory of knowledge must take them into account.
In answering his question, Kant endeavoured to discover the nature of reality from the conditions of reality, and in so doing he constructed the world of objects, step by step, on the plan of the world of knowledge. If there is such a world intelligible to us, the conditions of its intelligibility are very analytical. Whether the actual world was of the kind which answered to these conditions was, and is, a question which Kant could not answer. For his solution had regard to the conditions of intelligibility, and not to the actual world of human experience. So his intelligible world remained a phenomenal world, purely hypothetical; and the question of the relation of this phenomenal world to reality remained unanswered, or, rather, the answer was farther removed than ever. Instead of the old dilemma, we find ourselves in the presence of a new one, and one more radical than ever; for we have removed the older difficulties, only to be confronted with a new contrast between reality and appearance, between phenomena and things-in-themselves, between the world of the knowable and its relation to the world of the known and the analysis of thought and its action will give us the conformity of objects to cognition, and the consequent setting forth of the conditions of knowledge, lead to this contrariety of the world of reality and the world of thought? If conformity to our cognition, as in the new question asked by Kant, and its answer, removes reality from our knowledge, and restricts our knowledge to phenomena, there is time to ask another question as to the relation of thought and things. When and where in experience does intelligibility begin? Are we to regard intelligibility as something impressed on things by the action of the mind? Are mind and objects? Of course, if objects are to be intelligible, they must conform to the nature of the intelligence which apprehends them. But is the intelligibility conferred on the object, or is it to be supposed intelligible in itself? Are objects really what Hume—and in this Kant seems to be at one with him—calls independent facts, and are events really disconnected which are outwardly and contingently gathered together in our minds by purely mental relations? Kant did in his philosophy show that the Nature known by us as knowable is systematic, and finally came to the conclusion that this systematic character is associated with the unity of self-consciousness. But consistent thinkers must not suppose that this systematic character of Nature is not conferred on it by us, that, in fact, it is implicit in the earliest experience of rational beings; and the business of our thinking is to make explicit what is implicit there, and to articulate in detail what is incursively present at the beginning.

And yet, while we regard as true the relation of thought to an intelligible world, it must not be supposed that the world of thought and the systematic world discovered by it are identical. Nor can we suppose that the two are so connected that the analysis of thought and its action will give us the real world. While thinking is a real factor in the making of the world, as we know it, it does not follow that the real world is one thing when thought and other sense data are given to us, as thinkers and actors, it is so, and the reality for us expands with its explanation, and, through the operations of thought in the processes of conceiving, judging, inferring, the indefinite becomes defined. The contents of thought presents are articulated into a systematic whole, and differences are held together in a unity which contains and explains them, and so for us the world is made. Yet the law of gravitation was at work before Newton formulated the law of inverse squares, and the conservation of energy was a law of things before Joul made his experiments and expanded its meaning.

It is not possible, then, to identify the movements of the world, or the succession of events, with the lifeless sequence of our intellectual processes, for the latter may render explicit what lies before us in the world of mere concrete experience. It is necessary for the philosophy of the present time to go further back into the intelligibility, and ask how it began, and to show that the world of ideas into which thought has gathered its experience had relations with fact long before reflexion began, and that the difference between sense and understanding, between fact and truth—In whatever way we put this ever-recurring contrariety—is less absolute than empiricism has supposed. The correspondence between the perceptual and the conceptual worlds is closer than has been supposed. As we have already said, percepts are a product of the activity of thought, and concepts are in touch with perceptual reality. The processes which we may describe in our text-books as if they were separate and in isolation from the hypothetical object of our thought determine our interaction with the world and its objects comes to self-realization.

We must, then, set aside the assumption that reality and knowledge begin in each other. We must begin, and from these strive to reach a world beyond itself. Subjective states as such are never present without some objective reference, whatever that reference may be. Even feeling, which has been described as subjectively objective, has in it a content which cannot be explained without a reference which leads beyond that state considered in itself. Pleasure and pain, though subjective states, have an objective reference. More clearly, is this true of the states of consciousness which we describe as sensation and cognition. These have objects, desires, aims, purposes; and they reach forth towards their objects. Thus we are justified, from the psychological point of view, in saying that there are objective and subjective elements in the simplest cognition. All the changing states of consciousness have objective references, which may be described as both subjective and objective; and the process of thinking is just the articulation of these correlated elements into the fabric of our thought, whether that thought is occupied with the analysis of itself, or with the body of knowledge which is the real possession of the kind. Thus we seek to advance from thought to things, not from things to thought; these are together at the onset of cognition, and full cognition ideally realizes them as one. Instead of holding that thought determines reality, it would be better to say that reality determines our thought, and that, when reflexion uses the apparatus of notion, judgment, and reason, it is guided by principles which are true of reality as well as characteristic of thought.

More especially it may be affirmed that the aim of the mind in its judgments is always objective. It seeks universality which will give us a better way to connect together what belongs together. But there is a distinction in its procedure, which marks also a distinction in the form of judgment. There are judgments which are active endorsement and acknowledgment. There are judgments which are attended by active belief, and with the conviction that it is impossible not to believe. The attitude of genuine belief, of acceptance of control by the mind, is characteristic of certain judgments. Here the mind is in an attitude of certainty; it knows, and can act on the assurance that this judgment is true. But there are judgments which seem only
probable. Here the mind is in a state of suspense; it is uncertain, and can only construct a conclusion from which it withholding that position of certainty which in other situations it asserts. It is not possible here to enter fully into the positions of those who have been called lately the Austrian school, or to dwell on the suggestive work of Meinong and others. (As to the meaning of assumption, see Meinong, Uber Annahmen [1910], and Baldwin, *Genetic Logic.*) It is sufficiently to say that we regard belief, when always, or is always regarded as, of objective reality and validity. It regards itself as true, and as valid in the sphere of fact.

12. Connectedness of objects of thought: significance of mathematics for Epistemology. — We come now to what we stated to be the third mark of true knowledge—the assumption of connectedness among the objects of our thought. That there is such a connectedness, which we do not make but discover, we regard almost as axiomatic. What the connectedness really is has to be discovered in every case. The postulate of the mind is that there is such connectedness; that its formal attitude in relation to all the objects of its knowledge. With regard to things, it postulates the relation of cause and effect, and other universal axioms which it regards as necessary. No doubt there has always been a tendency to bind together the abstract form to extremes, and to bind all experience into those unities of abstract thinking. As an illustration of this, we may instance the tendency to make that necessity, of which mathematics may be cited as the symbol, the type and norm of all experience. We see this tendency at work in the attempt to reduce all the sciences to mathematical form, and in particular to reduce biological problems to physical and chemical terms.

Yet, after all, the study of the history of mathematics, especially in some of its more recent developments, is not without interest to the student of the theory of knowledge. In his *Prolegomena to all Future Metaphysic*, Kant asks the questions, 'How is pure mathematics possible? How is pure metaphysic possible?' He thought he had established the validity of the mathematical sciences by showing that they are confined to phenomena, and do not apply to things-in-themselves. In mathematics we have the unconditioned necessity, the a priori truths, which may be regarded as constructed by the mind itself, and the knowledge of such things does not apply to things-in-themselves. Whether this really involves the doctrine of the relativity of knowledge and of the unknowable we do not stay to inquire. Our present aim is to look at mathematics and physical science generally, in the interest of Epistemology. For in mathematics we may distinguish between the thinker and his thought, as we do in other branches of science. We may look at science from the point of view of a record of the mind that thinks, relates, elaborates, and as a record of the inter-relations of the facts of Nature as these are understood and interpreted. It has been held that in mathematics the mind is creative, that it has made the facts with which it deals, and that in this sphere there is no difference between mathematical science and mathematical thought. We make our definitions, we state our axioms, we claim our postulates, we have our intuitions; and, reasoning from these, we have elaborated our algebra, and constructed our calculations. In this sphere, at all events, it is claimed that the mind has constructed its objects, and not only constructed them, but has also called them into being. But it has to be borne in mind—and here the pragmatist has something to say which is relevant—that geometry, algebra, and all the other branches of science, have arisen in response to the demand of practical need. Geometry arose to meet the demands of land-measurement, and algebra arose simply as an extension of arithmetic. These sciences arose out of practice, and in its highest forms mathematics may be viewed as a measuring and calculating instrument invented by the mind in its desire to make Nature subservient to its own purposes. The primary purpose of the main interest of mathematics, and there are others who regard mathematics as the type of true knowledge. The latter look at the applications of mathematics as of interest only in so far as they suggest problems in pure mathematics. They are inclined to think that all the sciences remain imperfect and crude until they have come under the mathematical yoke and submitted themselves to its rule and method. But the ultimate question in Epistemology is, Does thought determine reality, or does reality determine thought, or what is the relation between thought and reality? Granted that mathematics is so fact-mental a product, in fact much more a mental product than the more concrete sciences are, still we may ask, What is the relation of the constructive mind to the science which it has constructed?

If we go back to the beginnings of mathematics, we find that it grew out of practical need. It was an instrument made for the overcoming of Nature. Man had to master his environment, and in the struggle he came to those constructions which we find used as a means for measuring and counting. But, when man drew his first circle or saw the mystery of parallel lines, a new view burst upon him. The figures became something in themselves and to be studied for their own sake; so we find various demonstrations discovered by many thinkers, various problems solved, until at length Euclid gathered the geometrical science of his time into that book which still remains the foundation of geometrical science. We find men also studying the various properties of the sections of the cone, and setting them forth, largely for practical use, but also with a desire to know all the possible meanings of the construction which they themselves have made. Numbers were useful for counting, but their characteristic features were themselves the object of abiding interest. So it has been with the figures, with the mathematical science and mathematical thought. Mathematical formulae may be regarded as concepts, and they play the part in mathematical thinking which analogies play in other thinking. But the meaning and scope of concepts or of mathematical formulae, and their worth and validity, are things not given when they are formed. In both cases the intent and meaning are the objects of endless research. Thus we find, throughout the ages, those thinkers to whom mathematical thought owes their advance towards systematic coherence occupied with examining and strengthening the foundations of mathematics, purifying its methods, submitting them to proofs ever increasing in rigour, and putting to stringent tests the scope and range of current conceptions. Geometry by itself made progress, algebra by itself became more and more comprehensive and thorough; and, by their union in the hand of Descartes and their cross-fertilization, a new era in mathematical science began. Analytic geometry arose, and out of it sprang the calculus. Here, too, men were occupied with the meaning of the new formulae which they had invented. For a new formula, though the work of mind, obtains an object value as soon as it is formulated. Mathematicians had to study their own
formule, to follow out their implications, and they were often surprised at the new and strange worlds which opened out to their investigation. For by means of the mathematical method, old equations, and rules invented by the ancients, were discarded, and new and more universal and more particular by the exercise of that thinking power which first constructed them. This is one feature of the epistemological value of mathematics.

But there is another aspect equally significant. Mathematical formulae, as we saw, arose out of practical need, and were invented in order to obtain control over Nature. Equally every new departure and every extension of mathematical formulae was supported by practical need, and their validity was tested by ability to solve the problems which were presented to men by the practical difficulties they encountered in the course of their widening experience. On the one hand, man strove to extend the range of his concepts through the notion of symmetry, more logical, more flexible, and more comprehensive; and, on the other hand, they applied them to the solution of practical problems. We may note here the great advances which Newton made by the conception of fluxions—a new conception, by the use of which he passed beyond the static world of concepts, in which every concept was regarded as eternally one and the same, to a world of motion, of change, of continuity. Even change had been regarded before him as discrete, discontinuous, made up of steps, each step being regarded as equal to another. By the use of the concept of fluxions Newton enabled mathematics to accommodate itself to the notion of continuous change.

All applications of mathematics consist in extending the empirical knowledge which we possess of a limited number or region of accessible phenomena into the region of the unknown and inaccessible. Nature herself has the power of pure analysis consist in inventing definite concepts, marked by symbols of complicated operations; in accumulating their properties as independent of recent or old research; and in extending their usefulness beyond the limits they were originally invented for,—thus concepts of a higher order. A brilliant example is the most suggestive example of this kind of reasoning was afforded by a novel mode of treating a large class of physical problems by means of the introduction of a special mathematical function, termed by George Green, and later by Gauss, the "Potential Function." All the problems of Newtonian attraction were concentrated in the study of this formula; and when the experiments of Coulomb and Ampère showed the analogy that existed between electric and magnetic forces on the one side, and Newtonian forces on the other; still more when Fourier, Land, and Thomson (Lord Kelvin) pointed to the further analogy which existed between the dissipation of tension in the stationary flow of heat and that of statical electricity on a conductor, and extended the analogy to hydrostatics and hydrodynamics,—it became evident that Nature herself pointed here to a mathematical dependence of the highest interest and value (Mers, History of European Thought, the Nineteenth Century, ii. 608.1).

We might give many instances of the advance of mathematical thought, and note how, as knowledge widened, new problems arose, and, as they arose, new inventions or modifications of old mathematics to meet with them. Our present interest is not, however, in the development of mathematical thought, but in the light which that development casts on Epistemology. That interest is regulated by the concluding phrase of the foregoing quotation: "Nature herself pointed here to a mathematical dependence of the highest interest and value."

Mathematical formulae have an interest in themselves as products of thought—a world in themselves, self-contained—and they can be exhibited in the light of the highest admiration for the symmetry and beauty, but we learn also that this mathematical world by no means gives us that particular world in which we dwell, and which we must learn to live in. The new mathematical world is consistent with many kinds of worlds, whereas ours is a particular world, and has its own character and meaning. No doubt it is consistent
mathematical science has its limitations as well as its conveniences, if not its necessities. A very successful for the enlargement of knowledge within its own sphere led to that abuse against which Baldwin has protested so emphatically. It is limited, we again say, to what can be numbered, weighed, and can somehow be measured. There is a sphere in which mathematical reasoning is inept. Even in the spheres in which mathematical reasoning has been so triumphant, it is found, as in physics, that the changes in Nature depend not so much on the laws of mass and energy as on their distribution and arrangement. While there are thus truths of reason which are valid for all objects, whatsoever they may be, and while there are what we call laws of Nature, valid for the physical world in which we live, there are actual facts of collocation and facts of distribution and arrangement which cannot be deduced from the necessities of reason, or from the laws of Nature, which have to be ascertained. Any fact is consistent with the laws of Nature and with the ideas of reason, but what the fact is must be otherwise discerned than by deductive compulsion. Concepts of new magnitude are subject to constant revision; but, revise them as we may, there are many things and experiences which escape their grasp.

Summary of mathematical thought.—Mathematical science has, therefore, its limits; experience is not to be measured by them, however great and far-reaching they may be. Dissatisfaction with mathematics, physics, and chemistry, as the north and south extremes, is even variously expressed. For instance, Baldwin gives energetic expression to his dissatisfaction in the following note:

"The essential requirement, I take it, if one would accustom oneself to thinking in genetic terms, is that one free himself from the compulsion of the mechanical and a-genetic concept of causation. We have all been hypnotized by the thought that the cause of the type of impact, transfer of energy fixed in quantity, with a formulation of effect in terms of an equation with composition of forces issuing in a resultant—as in the "paradigm of forces." We are told that nothing can be in the effect that is not already in the cause. All this is a partial and forced interpretation of nature. If science deals only with such causation series, then the great body of what we may in the large sense call "conditioning," or "sequence," remains uninterpreted. The Adaptations, Growth, Novelties, in nature are, as it were, in the antecedence to the scientific observer as are the Identities, Conservations, and Effects. Why may not the sequential and contingent event have something to do in it among the antecedent term? It usually does. The causal interpretation, commonly given an abstract meaning reached by excluding certain transitions or characters in an event called the effect. The genetic progression recognizes all the characters of a sequence, both the causal interpretation and an abstraction, but attempts to reconstruct nature in the fullness of her processes of change from the mode that conditions to the richer mode—be it what it may—that succeeds' (op. cit. L 25, note).

The protest is emphatic enough, but it might have been accompanied by a recognition of what has been accomplished by the assumptions it criticizes. By the use of mathematical formulae, by the study of physics and chemistry, by the evolution of mathematical thought, science has penetrated far into the arena of Nature. Assuming, as it did, that there were an order and arrangement to be found out in Nature, science, by inventing mathematical formulae ever more comprehensive and more subtle, was able not only to set forth the more conspicuous elements of the natural order, but to set it forth in its continuity, and in so doing advanced towards the conception of unity. These mathematical formulae also raised fresh problems which, in being solved, led to interpretations of natural phenomena which, had there been a sphere in which lay far beyond the unbiased vision of man. So the content of knowledge, the control of Nature by knowledge, and the validity of knowledge as it is, is not to be explained, as the casual interpretation of an abstraction, but attempts to reconstruct nature in the fullness of her processes of change from the mode that conditions to the richer mode—be it what it may—that succeeds' (op. cit. L 25, note).
Biologists; and we must construct suitable concepts for their expression. Yet men are unwilling to take the trouble, or to yield up the control which the use of quantitative concepts apparently gave over the phenomena, to which they were applied. Hence we have lost the extension of mathematical and physical formulae to cover the field of life. Biological phenomena were attenuated till they were brought under the domain of mathematics, physics, and chemistry. No doubt this attempt was so far a just one, because living forms, so far as they are quantitative, are subject to measurement, and are, therefore, suited for mathematical analysis. What cannot be mathematically analyzed are simply the internal states even of the protozoa. If a thing has an inside, and its relationship to other things in space is not determined merely by its outer surface, there is no term yet defined which rests outside of the thing. We may explain it in the term of a paradox: The better we conceive the things we understand them, and conversely. We conceive the inorganic processes best, that is, we can define them most accurately as to make them calculable. The vital processes are so easily reduced to conceptual mathematical formulae and calculation. Biology works with empirical laws altogether, the complete reduction of which to ultimate elementary laws of Nature has so far proved to be impossible. Man is the most incalculable being in existence. Hence it is that his acts are still regarded as absolutely indeterminate, or as the effects of an indeterminate agent, the so-called free will, which is simply equivalent to denying the possibility of conceiving or defining him. The reverse is true when it comes to understanding. Human life is the only thing that we understand perfectly. We reach the maximum of understanding in history; it is a less complete in zoology and botany, and vanishes altogether in physics and astronomy, where we have the most perfect mathematical concepts possible. (Intro. to Philosophy, Eng. tr., 533.)

15. 'Begreifen' and 'Verstehen.'—Paulsen distinguishes between Begreifen and Verstehen, as thus set forth, is an interesting one, and may be regarded as both useful and convenient, from a popular point of view. But it is difficult to make the distinction good from a logical point of view, or an epistemological point of view. For, in the first place, what he regards as 'understanding' and as 'conceiving' are both mental processes, and are not the work of mind; and the distinction between them is one not of kind. In the second place, mathematics and physics, and especially chemistry, are not sciences which depend on calculation alone. Both physics and chemistry are experimental sciences, and, so far as they are experimental, they belong to what Paulsen calls 'understanding.' No physicist would limit his knowledge of any substance merely to what he can calculate. He must know the air, the sun, the earth, its roundness in its particularity, and is face to face with it as a real thing. He conceives it, and he understands it in its nature and in its behaviour. So here the distinction is inept. In the third place, when he says that the air is the most incalculable, and its existence, and refers to free will, one would like to know what is his view of free will. To be fair, he does not say that he holds that view of free will which I have just described in the paragraph before. He so far identifies himself with that indeterminate view as to use it as an element in the position that man cannot possibly be conceived or defined. Is man incapable of forming a doctrine of freedom he is well able to infuse intelligibly set forth in a definition of freedom as a principle of explanation in a description of man? We submit that all that can be inferred from the distinction between Begreifen and Verstehen is that mathematical, physical, and chemical concepts have their limits, and have to give place to other concepts when we turn from the physical sphere to the sphere where quantity comes to an end, and quality takes its place.

So then, when we strive to attain controlling knowledge of beings which are something for us entirely outside of ourselves, we first set forth in relation to other things in a world in space and time, we have to change our mode of conceiving them in order to suit the altered circumstances. The determining concept must give place to the teleological. We have to conceive a kingdom of means and ends, of things inter-related with a view towards a purpose. A new form of causation or linkage must be found. And the new concepts are forthcoming if only they have fair play. Final causes may be sneered at as vestal virgins, and may be discredited from many points of view, yet in modern times teleology has come to its own.

The theory of evolution has so far reinstated purpose as the ruling idea of modern thought; and in all spheres of inquiry we have learned to value history as the key to the explanation of the world of external things. Evolution makes room for novelties, for growth, for development, for the effect which was not in the cause, and we have to alter our conceptions to make them fit the facts. The processes of the world are not repetitions of former happenings; they are growth, development, evolutions; and the growths are intelligible and may be stated in terms which may be understood.

16. Objects as linked together by the teleological judgement.—Our Logic, Psychology, Epistemology, must be made flexible enough to meet the new situation. Not that the situation is new in reality, for the processes of evolution have gone on from the beginning; only men have changed the flowing, growing, evolving world into a static world which could be calculated in numbers, weights, and measures. Now that we have come to a better understanding of the world, let us alter our formulæ to correspond. In seeking to do so, we may not cast all the blame of former failures on our conceptual modes of thought. For we have no other means of thinking than by concepts, and our veneration of historical thinking which is directed towards the endeavour to make them adequate to their task. This can be done by the recognition of the differences between the objects which we think about, and by the recognition of the fact that what is fitting and adequate in one sphere are not applicable to others with different qualities and characteristics. For example, a little ago, we spoke of order, continuity, and unity as notions which have a meaning within physical science. In physics, however, order may mean nothing more than arrangement, but in the biological sciences, and especially in the sciences which deal with man, order means something more: it is a Quality of evolution: it is an aspect of the social order, where the conception is bound up with the highest social, ethical, and religious interests. Continuity has also to take on a larger meaning, as the subject with which it deals becomes more complex, and is not the consequence of cause and effect, nor is it the linkage of mere sequence; we have to think of continuity as constituted by a purpose which seems to gather the contingent into a rational whole. In this way, we can speak of meaning to individuality. So also with unity and with individuality. In truth it is only when we come to the action of life, only when we study things that have an inside, that intelligible meaning to individuality. There is a certain indefinite mantle of individuality attached to an atom of matter, but then its individuality is
limited by the fact of its inertia: it moves only as it is moved. It has its attractions and its repulsions, but it moves in response to them without any hesitation or choice. In living matters the response seems to be of a different kind: the organism responds according to its own nature. As we ascend the scale of organization, individuality receives wider and more precise meanings until it becomes the characteristic of the organism. Kant could not speak now. In living creatures we do not speak of inertia, but of self-preservation—a very different conception. We can speak also of reproduction, and of heredity, and of those sentiments which seem to lie at the basis, or to accompany the fact, of self-preservation—of love, and hunger, which assume deeper and deeper meanings as the human race moves onward to higher progress.

This does not mean, therefore, that, when we pass from the sciences which are mainly occupied with inorganic matter, we are to do without concepts; it means only that we must form our conceptions directly to express the new facts. It is essential to hold that new concepts may be formed, or old concepts may be modified, and that new ideas may be evolved to meet the new needs. But the ideas that we depend upon are the laws of reason and the principles of Logic still hold good; only we may regard them as outside the scope of quantitative measurement. That is simply to say that sentiments are not to be calculated in foot-pounds, and that we do not measure love by the yard. It may be measured in intensity, if not in extensity. There is needed a treatise to deal with the teleological judgment, which will place it on the same plane as the determinate judgment. It is not enough to regard the determinate judgment as the type of judgment in general, and to place it on a platform of its own, as the only form of universal and necessary implication, and to regard the teleological judgment as merely empirical. This was the way of Kant. But it may be doubted whether the distinction between empiricism and idealism is as absolute as it has been assumed to be. If there is an order of the world, if that order can be understood, and if there are principles of arrangement in the world, then it may be postulated that the empirical order is also rational; and the judgments which have been regarded as purely hypothetical may also have a meaning in relation to the ideas of reason. That is too large a question to be discussed here. But, if the assumption of idealism that the real is the reflection of the mind, and that the distinction between empiricism and rationalism tends to disappear. What is empirically true may not be rationally false. Mathematics has shown us that facts and relations experimentally discovered may, with proper assumptions, be expressed with the utmost generality and necessity. Faraday’s electric discoveries were mathematically explained by Clerk-Maxwell, and his mathematical formulas were afterwards mastered by Hertz, and applied to practical uses by Marconi.

17. Relation of the determinate to the teleological judgment. This may be variously illustrated. Indeed, so copious are the sources of illustration that we are at a loss which to select. They are not opposed to each other. Rather the relation is that the teleological judgment steps in to afford an explanation where the determinate judgment ceases to be intelligible. The teleological presupposes the determinate judgment. In the case of the latter we are occupied with the understanding of things as they are—their nature, their sources, their functions, and so on; but when these are so far understood, we are prepared for a new kind of action. Just in proportion to our knowledge of things as they are, are we able to impress new meanings on them, and make them subservient to our purposes. We investigate Nature, and transform it into our sciences of astronomy and ethnology: we apply the principles of mathematics; or we measure and calculate heat, light, electricity; and, having so far mastered these, we proceed to new constructions, the explanation of which is not found in the abstract sciences, but in those sciences which deal with the relations of teleology begins, and it has a place in the theory of knowledge, not merely on empirical but also on other grounds. The whole system of efficient causes is implied in every machine, in every work of art, and in every construction which man has impressed on Nature. So we mould, alter, control Nature, and make her do our will; and she lends herself to the expression of new meanings which have been impressed on her former system of working. We make our harbours, build our ships, construct our roads and railways, invent all the instruments of peace and war, and reap the reward of our ingenuity and intelligence. When we are satisfied that a machine is a new meaning impressed on Nature, in order that man may make his work. It is possible to explain a steam-engine as a system of mechanical forces; or we may write a history of its invention, and trace the course of its evolution from the kettle of Watt to the engines which drive Atlantic liners across the sea. In this history no mention need be made of the minds which successively made those changes which increased the complexity, efficiency, and usefulness of the steam-engine. But every step of the process, looked at from another point of view, illustrates the action of the teleological judgment. Applied science is always teleological. Machines are constructions with a meaning which goes beyond the machine regarded only as a mechanical construction. The meaning is impressed on a system of efficient causes, in order that it work out a purpose. Thus in the case of any machine we pass beyond the sequence of cause and effect, and beyond the linkage of mechanical explanation: we have to consider the effects of things of another kind—things which require new concepts for their description and interpretation.

18. Validity of teleological knowledge. Here, too, we may instance something which is of significance for knowledge. We may recognize that there is a valid knowledge of the individual. Individuality is a valid concept, though in our logical and psychological systems there is apparently no room left for it. Psychology tells us formally that it has no place for biography; and Logic tends, on almost every scheme, to pass away from what it calls the mere individual. But, on any theory of knowledge, room must be left for the idiosyncrasies of the individual. Surely a biography may be written, and may contain true and adequate knowledge, and there may be a description of the uniqueness of the unique. Hamlet and Macbeth have been described, and attempts have been made to understand Julius Caesar and Napoleon; nor have Plato, Aristotle, Kant, and Hegel been set aside as unintelligible, though all of them have risen above the commonplace. We may perhaps call the great poets, not by subsuming them under general categories, but by diligently studying them in the circumstances of their life. We place such
men under the subsumptions of the teleological judgment, with its categories of purpose and freedom; we find room for the study of individuality and the personal, individuality, purposes come into view. An organism cannot be defined without implicating all these at least. We cannot describe an organism without the recognition of it as the product of an organ in life, without the implication that the organ has a meaning only in relation to the whole organism. We may, for descriptive purposes, reduce the phenomena of an organism to a number of systems, such as the circulatory, the muscular, etc.; but, after this description, we have to go back to the recognition of the organism as a living system, all the parts of which are in relation to the whole, and the whole is realized through the inter-relations of the parts. Still further, there is the fact that for the understanding of the organism the principle of unity and of action is within it. It has an inside. It is an old observation, 'Plant the skill of the shipbuilder within and you will see how Nature works.' The skill of the shipbuilder is within the timber in the case of every organism. This conclusion has been forced on us more and more by the progress of the science, and that of Darwin. It is not necessary to point out how, even contrary to the tendency of Darwin himself, teleology has been enthroned in the highest place in the sciences which deal with life, and Epistemology recognizes the significance of the concept, and has to make room for it. In every organism considered in its individuality, in every case considered in a concept descriptive of a certain kind, in the slow process of the evolution of living forms, we have been taught to see, in the growth of living things, a tendency towards a goal, a means towards an end; and this tendency has all the system of efficient causes at its service. It is not necessary to dwell further on the story of evolution as it is told to us at present; the great epistemological interest of it lies in the fact that a new set of concepts is at the service of the theory of knowledge—concepts which have the merit of recognizing a sphere of knowledge and of action, which had been inadequately recognized in our logical and psychological inquiries. A study of the theory of ideas in Epistemology will yield fruitful results for Epistemology.

18. Criticism of the teleological judgment.—A critical inquiry into the teleological judgment would necessitate, in the first place, an investigation into the psychological conditions of its exercise, and, in the second place, an inquiry into the objective products which are the outcome of that exercise. Psychologically, we should need to investigate the whole web of purpose, the phenomena of means and ends, the fact of aim and desire, the power of forming ideals, and the means at our disposal in order to carry them out. For it is indispensable, it is, indeed, a fact of common experience, that living creatures have some conception of using Nature for their own ends. It is a fact that rational creatures have a certain power of self-guidance, and of modifying Nature, and of making Nature serve their ends. They seem to live and reap, they can use the changing of the seasons in order to store up food for future need, they can adapt themselves to their environment, not merely by the instinctive action of the animals, but by adapting the environment to their needs. They clothe themselves in heavier raiment when the seasons change, they build houses, they seek their food, and everywhere in human life we see men moulding Nature in order to make life more easy, more comfortable, and more successful. We need not dwell on the fact of the teleological judgment, it is manifest. It is one element in adaptation, and it is thus a proof of the validity of the scheme of means and ends which is characteristic of life in general.

In the second place, a critical analysis of the teleological judgment would lead us into the objective investigation of all the works of man. These, again, are of the most important kind for the purpose of the teleological judgment. We must investigate these works of humanity from various points of view. We might look at them as bodies of truth, and seek to test their scientific value. We might regard them from the point of view of description, and set them forth in that descriptive process which is another name for explanation. Or we might seek to appreciate them, to estimate their worth, and their aesthetic, logical, psychological, and metaphysical values. But, from our present point of view, our aim is to regard them as a set of human ideals concretely realized in the art, the science, the poetry, the philosophy, and the religion of mankind. Teleology would thus become a history of the ideas which are embodied in the history of literature, to use a comprehensive word which includes all the works of man enumerated above. Teleology studied in this comprehensive sense would give us most valuable material for a complete view of human knowledge, and would set us free from the tyranny of mere science, with its exclusiveness and its incompleteness. It would enable us to set its proper value on history as the supreme record of human endeavor, and to realize from a new point of view that distinction which Paulsen sought to establish in the quotation already made. The study of ideals, as these have been objectively realized in the life of a people, as realized in art, in sculpture, and in painting, as realized in the great poets of the world, as also in the philosophies of all nations, would open out to us the objective realizations of the teleological processes of the human mind and their several worths.

20. Teleology and ideals.—The power to frame ideals, and to appreciate them when they are set before us, is one of the characteristics of man. If this be so, then there must be some way of setting forth the procedure of the mind in the formation of ideals, and some way by which their validity and influence may be tested. This investigation into the whole subject—an investigation which can hardly be said to have begun. For it would mean an investigation into the whole of human creations, as these are embodied in institutions, constitutions, political activities, national characteristics, and international influences. All these may be regarded as embodiments of characteristic ideals, and their sources and influences would have to be considered. Again, art, science, poetry, literature—in fact, all the achievements of man in the world he has made—would have a place in the great analysis of ideals, their nature and influence. Out of this investigation there would issue a new set of concepts, to describe the experiences of mankind in this relation, to supplement and correct, or at least to modify, conclusions drawn from the system derived from man's primary intercourse with Nature. Whether this be the case, or whether, then, there may be great gain for the theory and nature of knowledge, if one could only find a way to utilize it. It is the glory of ideals to be great and broad and comprehensive as it is the same to all, too wide to be realized in any single form or mode. Take the ideal in any sphere of human aspiration—architecture, for example—and we find it to be made up of certain qualities,
none of which can be neglected in any building worthy of the name—qualities such as strength, beauty, dignity, fitness, durability. Each of these may be realized in different ways: there may be many buildings which realize it under this style has its ideal; architects have their visions, and they have examples in which former ideals have been realized; and so, out of the grandeur of their vision, and what is the knowledge, they build, and the building remains an illustration of the working out of an ideal. So in art we may make a study of the vision which the artist saw, examine the way in which he realized his vision in the form of painting or of statue, and note the limitations and restrictions laid on him by the material in which he has worked. So also in poetry, and in literature generally, we may trace the sources of the ideal; we may note how it grew, what it fed on, and how it was realized; and we may be persuaded that in these investigations we have a real illustration of the growth and law of human knowledge. Here we are delivered so far from the bondage of the actual. We are in a sphere where the human mind, master of its own experience, or so far master of it, sets itself to embody its own meaning and its own vision in a real way, and so the ideal is not a private meaning, but one that can be the common possession of all men. This translation of a private, individual vision into forms which become a common possession is one of the characteristic ways of human achievement, and one of the ways of raising men to a higher level. We may study the work of the great masters in painting, sculpture, architecture, poetry, science, metaphysics, and in the study of them learn a lesson in the characteristics of what knowledge is and means, which we could never learn from the abstract discussions by which men have sought to delimit knowledge, and to assent to it bounds beyond which it cannot pass. Here, too, we may study in concrete form that great subject of individuality and personality which eludes the analysis of discursive thought. We may allow Psychology to occupy the place of the abstract spectator, and to say that Psychology is not biography; we may allow Logic to lay down the conditions of thought, and to elaborate the categories under which all fruitful thinking is to be performed. We may cause metaphysics to deal with the ultimate problems of reality, and need not refuse generous recognition of their validity and worth, and yet claim that in the work of the great masters revealed, painted, lived, and acted, and fields of knowledge of which they take but little cognizance. For there is real knowledge in this sphere, which all must recognize as real.

In this sphere we are not independent of Psychology, Logic, Metaphysics, or Ethics. For these supply the principles upon which our study of the achievements of men must proceed. In all our actions we must be logical, psychological, metaphysical, and even mathematical; but the sciences mentioned do no more than prescribe the conditions under which we work; they do not fix the vision which the seer sees or the ideal which he seeks to order. And whereas we must postulate the man who sees, and the mind which has been in the presence of the ideal. But the vision has been seen, the ideal has been ordered, and the ideal must be fixed and acted on by the man himself. And this is true of not only the facts of physical or chemical science, and as such they may be known and set forth in practice. Here, too, we may study the activity of man in its creative, object form, so that it is no longer a private, individual vision, but becomes the common possession of all men. And in the study of the conditions under which such activity is possible, for it works under conditions in art the conditions are primarily those set by the material in which the artist works. The sculptor must have regard to the marble or other material in which his creative faculty labors. He has also to work under the mathematical, physical, and chemical conditions of the material, and these are all human conditions, for they are set by knowledge. Mental conditions are also present, but need not again be enumerated. Yet, when the artist respects all these conditions—and if he neglects any of them, his work must fail—within the limits of means of means, he embryos his vision and realizes his ideal. The conditions do not fix the vision, nor do they contain the ideal; they only say that, if the artist is to work, these conditions must be fulfilled. If we are to understand the new product, the only cause to be assumed is the artist. And to understand him, if we can, we must pass from the general conditions under which he has worked, and study him as something which cannot be subsumed under general rules. For the proof of this we must refer to the critical studies of artists and poets, which, happily, are not non-existent, though they are often lost under the general rules which are applicable to all men, and therefore are not illustrative of the singular genius they seek to describe in his habit as he lived. There must be some way of studying and understanding him, for he has appeared on the earth, and have been active in making history; and such a study is not without significance for the theory of knowledge.

21. Teleology and History. The mention of history leads us to the recognition of what it is, what it means, and how it is to be understood. Paulsen, as quoted above, says that this is what we all understand but cannot conceive. This presupposes that conceiving is only of the general, the abstract, the universal, and necessary. But concepts may be changed, and their range enlarged, and they may be made such as to represent the reality with which we have to deal. We see how, in physics and chemistry, we have a new set of names to represent the new understanding of Nature to which men of science have come. Why should it not be so in the sphere of history? Are we to say that our failure to conceive belongs essentially to the very nature of conceptual knowledge? Even in that case, the limitation and the imperfection of knowledge are not determined by the knower or by the known, but by the imperfection of the instrument by which the knower seeks to express himself. If this is so, then there is hope for knowledge. It must revise its instruments, and make them more elastic, and more precise than it眼前 or eye must be aided by the microscope, and the language must become more precise and more fluid at the same time. We must find a way of expressing the particular as well as the general, nor ought we to preach agnosticism until we have exhausted the possibilities of expressing the knowledge which we plainly possess, though it has escaped the meshes of our previous formulæ.

The study of the productions in which the human spirit has objectively expressed itself ought to give rise to the science of ideals. There is true and real knowledge to be found in this line of investigation, however great may be the difficulty of bringing it under rules and categories. All we need is to be in the sphere of religion and ethics we are face to face with sets of facts which have not yet been formulated. Here, too, we are in the sphere of creative personalities, which set from their own knowledge on which facts we have to deal. It is curious to observe that in the history of mathematical thought we are ever in the presence of creative personalities. From Pythagoras and the Pythagoreans onwards under such conditions is possible, for it works under conditions in art the conditions are primarily those set by the material in which the artist works.
called by personal names illustrious in the history of electric discovery. But in the sphere of religion and ethics personalities dominate. Ideals are created and appreciated by other men, and become the living influence by which history is determined and character is formed.

Real, deep devoutness, such as controls the whole life, is certainly of a character that is only to be found in a few. But it is on the basis of those few that the nature of an age's piety must be determined. Just so must we determine the art of a period on the basis of the real artists. For in these devout men, as in those artists, lives the eternal, ever-moving spirit of religion and of the civilisation and of the rest, ever fresh, always new, just as they, to follow them, and at least to acknowledge as form and authority that which they cannot receive as spirit. But many out of the throng do receive a ray of the spirit, and warm their cold life with it. Any one, therefore, who desires to depict the pietà of the West in the fifth century must describe the pietà of Augustine; whosoever wishes to understand the pietà of the twelfth and thirteenth centuries must study the piety of Bernard of Clairvaux and Francis; he who seeks to grasp the pietà of the sixteenth century must make acquaintance with the pietà of Luther, Calvin, and Knox; and so throughout.

But these names show what a power a pietà has been in the history of the world and of civilization; these names show that the level of that which is the beginning only not of wisdom has also of night. Ought I to add the name of Crouwell or of Mohammed? The greatest events and changes in the history of the world have had their origin in religion—not in the public religion, but in the purely personal, in that secret religion which remains unrecognised by individuals, undistinguishably leaft and faintly from a newly breaking spring? (Harnack, IV, x. (Oct. 1911) 707.)

We quote this interesting and profound passage as the kernel of our definition of our thesis that the knowledge of individuals and of personalities is real and valid knowledge, even though it cannot be predicted, and cannot be calculated. Harnack has shown that personal, purely personal, has been the source of the greatest events and changes in the history of the world; and this is true not only of piety, but of every characteristic of creative personalities who have been centres of influence for their age and epoch. Rightly to understand the influence of man on man, and the receptiveness of the average man towards the personal influence which streams forth from the exceptional man, would be to see the inner connectedness of history, and to differentiate history from the mechanical action which is the rule of the lower world.

'As there exist graded series of special and more general laws for things, there are also numbered steps between the influence of the average man, whose will is included only in the will of his neighbours, and the will of the religious leader, or the artist, or the prophet, or the hero whose will gives the will of millions, and enters in pure identity into the minds of whole nations. For such a will exists, judgments, nothing is all but absolutely unimportant there; but only by this emphasizing of the important and decisive does the system of identities become an organic system, in which the fate of peoples, in their leaders' spirits and in their quiet names, can be understood.' (Münster, Die Entwicklung des Welterlebens, 102.)

Leaving now the study of the products of mankind in the light which they cast on the problems of knowledge, let us look for a little at history, and endeavour to find why the methods and assumptions of natural science are inapplicable to history.

We assume, indeed, a connectedness in history, but we soon find that the connectedness is not that of cause and effect, or mere temporal perseverance, as the final judgment finally amounts to. In the historical world, or in the world of which men live and work, objective things assume a new form. They become not only a system of causes and effects, but one of means and ends. They are objects of desire or of aversion. When the actual becomes an object of desire, it is invested at once with new properties, and is transformed into an object which has a new meaning—a meaning arising out of the relation placed on it by the fact that it has become an object of desire. In history all objects are considered as objects of will, and their natural qualities are treated as arbitrary.

In history, therefore, what is dealt with is no longer objects as seen in their scientific connectedness, but objects seen in their new transformation as interesting in their relation to the fulfilment of human desires. Thus a new science arises, with new methods and aims, also with new categories to set forth all that newness, which yet has a connectedness that can be understood. It will become a science which deals with subjects, with wills in action and interaction with the world in order to transform that world into a world of values and worths. The new science will take into account the fact of individual wills and personalities, and endeavour to show how these wills become the general will, or how individualities, while maintaining their distinctness and their peculiarity, become a conscious part of an organic whole, which will have its own reality. We shall have to widen our conception of organism, advance their new form of it. Just as politically we have to find a new conception for the British Empire, which is a system of relatively independent nationalities, bound in unity such as the world has never been before, so it is with regard to the new conception of organism.

Real objects or objects out in the world of space become ideal when they enter into the world of desire. It is just the fact of this transformation which marks out the science of history from other sciences, and it is in this sphere that we are to look for the connectedness which obtains and must be obtained in history as in other sciences. The connectedness does not lie in the thought of the tendency of things to persist in their present state, but in the capacity of being transformed to meet human desire. It is not in connexion with the past that in history we seek explanations; it is in the unity impressed on natural objects when seen in the light of the possibility of their transformation to meet and to fulfill the purposes of man. That there is here an actual connectedness admits of no doubt, and to set forth this connectedness is an important task for knowledge. In history, then, there exists a real world which has arisen through human effort; and, if it is to be understood, it must be regarded as the characteristic activities of man. How human wills agree to act in common, how ideals can be impressed on the average man, how men act together, have a common purpose—are matters of great interest. How meanings arise, how they are communicable, and how ideals may become the common possession of a people—are questions which we may put but which we cannot answer here. Looking back over the past, we find that all ideals have been traced by the peoples to their great men. All religions trace themselves ultimately to a personal founder; all laws have been ascribed to a personal legislator. And, in general, every discovery of individual discoverers, inventors, or thinkers. In the transformation which takes place in objects when they become objects of desire, they are charged by those who are great enough to indicate to the common mind what objects they ought to submit to this transformation. What ought men to desire? What ought they to avoid? Here come in all the desires, and all the religions of the world, and the transformations which they have effected on the common world.

We may instance also the ideals which in the history of the world have become national—Hebrew, Assyrian, Babylonian, Indian, Greek, Roman, Teutonic, English, Scottish. Ideals are
there, with all their greatness, and also with all their limitations; and the influence of a national ideal on the members of the nation can be described. That ideal every individual within the nation makes higher, according to it, and thus makes the national will his own will. Again, one may arise within the nation who transcends the national ideal, yet is within it; and so he may modify it, and, without breaking with the past, make new feet upon which the ordinary man can safely tread. The main thing insisted on here is that history has to be understood from the point of view of ideals, that these are descriptive of the varied desires of man, and that the outcome of historical endeavour is determined by the efforts of men to realize their ideals. For these they suffer, strive, work; in the accomplishment of them they find their joy and their lasting joy. In a word, the sphere of history is the sphere of the teleological, and history is the story of the strivings of men to reach the ideal which somehow they possess.

The critical judgment as a system of values.—Here, again, we see how mind changes its methods and its language as it comes into new fields of study. It does so in consistency with the laws with which it deals, and also in consistency with the nature of the objects it seeks to understand. In the fields of ethics, religion, and history it has to construct a system of values, for these are of essential importance in a world of ideals. But as a discussion of them will be found in art, Value, we need not deal with the subject here. Nor do we find it possible to discuss the problem of negligence or of error. The problem of error lies along the line of the problem of truth, and accompanies it all the way (see art. Error AND Truth). The subject need be discussed here only in so far as it bears on the task and nature of knowledge. Of course, all along the line of the effort to complete the task of knowledge there lies the possibility of mistake. The epistemologist may make a mistake in Psychology when he considers knowledge as a mental process. He may make a mistake in his description of the process through which the subject elaborates its objects, classifies them, transforms them. He may make universals which are not really such and land himself in the perplexity of those who work with inadequate models. The mistakes of the method may be made, which may be found treated in detail in any treatise on Logic, under the name of 'fallacies.' Mistakes also occur in the metaphysical field which may render untruthful the whole discussion of the epistemological problem. In our attitude towards the problem of knowledge we may be dogmatic, or we may be sceptical. We may have an attitude of belief towards which is essentially incredible, or we may refuse belief to truth which can be shown to be valid and trustworthy. All these things are possible, and many of them have been present as matters of fact in every age. What then? Are we to beware of knowledge, or of the possibility of coming to a right apprehension of knowledge, its worth, its validity? What are we to say of those systems which work out their own boundaries and declare that beyond it there is the unknown? Is it possible to say what are the bounds of knowledge, and if so, how far is it possible? Can this be done from the point of view of the nature of the knower, or from the nature of the known? We have not found this to be the case. We have not found it possible to delimit the sphere of knowledge, or to set it aside as a process inapplicable to anything which can fall to be found by its methods to be often inadequate; we have seen that it is apt to make conceptions which have proved powerful and adequate within one range applicable, without further inquiry, to another set of things, and to make one aspect of experience dominant over all experience, just because this has been more manageable, according to it, and thus makes the national will his own will. Again, one may arise within the nation who transcends the national ideal, yet is within it; and so he may modify it, and, without breaking with the past, make new feet upon which the ordinary man can safely tread. The main thing insisted on here is that history has to be understood from the point of view of ideals, that these are descriptive of the varied desires of man, and that the outcome of historical endeavour is determined by the efforts of men to realize their ideals. For these they suffer, strive, work; in the accomplishment of them they find their joy and their lasting joy. In a word, the sphere of history is the sphere of the teleological, and history is the story of the strivings of men to reach the ideal which somehow they possess.

The critical judgment as a system of values.—Here, again, we see how mind changes its methods and its language as it comes into new fields of study. It does so in consistency with the laws with which it deals, and also in consistency with the nature of the objects it seeks to understand. In the fields of ethics, religion, and history it has to construct a system of values, for these are of essential importance in a world of ideals. But as a discussion of them will be found in art, Value, we need not deal with the subject here. Nor do we find it possible to discuss the problem of negligence or of error. The problem of error lies along the line of the problem of truth, and accompanies it all the way (see art. Error AND Truth). The subject need be discussed here only in so far as it bears on the task and nature of knowledge. Of course, all along the line of the effort to complete the task of knowledge there lies the possibility of mistake. The epistemologist may make a mistake in Psychology when he considers knowledge as a mental process. He may make a mistake in his description of the process through which the subject elaborates its objects, classifies them, transforms them. He may make universals which are not really such and land himself in the perplexity of those who work with inadequate models. The mistakes of the method may be made, which may be found treated in detail in any treatise on Logic, under the name of 'fallacies.' Mistakes also occur in the metaphysical field which may render untruthful the whole discussion of the epistemological problem. In our attitude towards the problem of knowledge we may be dogmatic, or we may be sceptical. We may have an attitude of belief towards which is essentially incredible, or we may refuse belief to truth which can be shown to be valid and trustworthy. All these things are possible, and many of them have been present as matters of fact in every age. What then? Are we to beware of knowledge, or of the possibility of coming to a right apprehension of knowledge, its worth, its validity? What are we to say of those systems which work out their own boundaries and declare that beyond it there is the unknown? Is it possible to say what are the bounds of knowledge, and if so, how far is it possible? Can this be done from the point of view of the nature of the knower, or from the nature of the known? We have not found this to be the case. We have not found it possible to delimit the sphere of knowledge, or to set it aside as a process inapplicable to anything which can fall to be found by its methods to be often inadequate; we have seen that it is apt to make conceptions which have
and the resultant purification of our methods. May we not take it that the long processes of building up our knowledge and belief may be hastened as much as becomes master of his methods? Eminent mathematicians have been able to see the outcome of lengthened demonstrations in a brilliant flash of intuition; their mathematical formulae have been comparable with miracles, and they thought to read them as the ordinary man reads the pages of a book. May not intimations be the goal of all our discursive reasoning?

On the subject or from the object there is no hindrance to the hope of the indefinite increase of our knowledge. Intensively it will increase as we learn more of ourselves, of the world, and of the Maker of the world; extensively it may increase until it stands over against the world, and recognizes that through and through it is an intelligible world, a world that may be understood. With the increase of knowledge the knower grows, and the mastery of the world grows also.

I am a part of all that I have met;
Yet all experience is an arch whereby I
Glance that untravell'd world, whose margin fades
For ever and for ever when I move.'

JAMES IVERACH.

EQUIPROBABILISM.—1. Definition.—Equi-probabilism is a form of probabilism (q.v.) which stands midway between simple probabilism and probabilism. The equi-probabilistic principle may be stated thus: the opinion quo aye iure tute, i.e. the opinion quo liberati facit, may be followed, on condition that it is as probable as the opinio tute, i.e. the opinion quo legi faciet; we may not, on the contrary, follow the opinio minus tute if it is considerably less probable than the opinio tute. Probabilism does not admit of following the opinio minus tute unless it is more probable than the opinio tute. Simple probabilism demands only a strong probability in favour of the opinio minus tute.

2. Founder.—Alfonso Maria di Liguori (q.v.) is generally regarded as the founder of the equi-probabilistic system. This theologian was originally a rigourosus, as appears in his Malee Systematis. He afterwards went over to simple probabilism, and then to equi-probabilism. There are signs of the latter evolution in several of his writings prior to the year 1792 which he published at that date, for it was in 1792 that the founder of the order of Redemptorists published his Breve dissertazione dell' uno moderato dell' opinione probabile. It is difficult to say whether this change of opinion was suggested to him by the thought of the abuses to which simple probabilism gave rise, or by the desire to avoid seeing his doctrine suffer the discredit into which the ethics of the Jesuits had fallen at that time. St. Alfonso, in his equi-probabilistic system, rests on the authority of Eusebius Amort, who published a Theologia Dissertatio in 1733, and Junius (1679), Antony Mayer the Jesuit, author of a Theologia scholastica which appeared in 1729, and Rassier, author of a Norma Recti, published in 1738. Equi-probabilism is also regarded as a branch of equi-probabilism, but equi-probabilism as a theory distinct from simple probabilism makes a definite start only with Alfonso di Liguori. In ch. ii. (‘De Conscientia’), of his Homo apostolicae et decided in confessione instinctus (see the 1897 ed., Paris and Besançon), Alfonso formulates his opinion as follows:

'Tertius ittig, quae nostra est sententia, dict quod quosque opinio quo liberti facit esse acqua probabile atque opinio liberti facet, sine dubio et fidei potest.' Nevertheless he callecs attention to the fact that, in a matter of faith, one must always follow the opinio tutor.

3. Controversy.—Towards the end of the 18th and the beginning of the 19th cent. probabilism and even tutiorism became pressing issues, and remained so until the time when the Jesuits and other scholars revived the doctrine of St. Alfonso. Among his modern disciples special mention is due to Father Gury, the author of a well-known Manuel de théologie morale, and to Cousset, who insists strongly upon the equi-probabilism of his master. In 1864, Antonio Ballerini, the Jesuit, published a Dissertatio de morali sistematis S. Alphonso for the purpose of showing that Alfonso di Liguori had never taught equi-probabilism, and of claiming him absolutely for the side of the simple probabilists. This dissertation called forth an answer from the Liguorians, and in 1872 the Vindiciae Alphonsonianae appeared. This great work is a special plea in favour of St. Alfonso and equi-probabilism. It seeks to prove that this theologian was the inventor of the equi-probabilistic system, and that this system was always his. The authors relied chiefly on the dissertation of Liguori, written in 1749, entitled De usu moderato opinionis probabilis in concursu probabiliorum. No one before Liguori, they said, had ever spoken of a moderate use of probable opinion. In their eyes equi-probabilism was the most correct, most sensible, and easiest rule of moral conduct. They summed up their master's doctrine as follows. (1) In a case of doubt as to the existence of a thing the opinio quo libertatis facit must be as probable as the opinio quo legi facet. (2) In doubt with regard to the extinction of a law which has certainly existed, the opinio quo libertatis facit must be sufficient ground for moral certitude. (3) In doubt concerning a fact which involves a non-moral danger, the surest opinion must always be followed; in other words, one has no right, under pretext of probity, to be in danger, in any given case, the interests of a third person.

The Vindiciae Alphonsonianae led to a lengthy controversy. In 1873 a pamphlet was published in Belgoz, entitled Vindiciae Imediatiae against the argument of Ballerini (his dissertation is reprinted in the pamphlet) that Liguori was always a defender of simple probabilism. In the same year a discussion took place in the newspaper L'Univers (see the issues of 8 May, 25 June, 28 July, 28 Oct. 1873), in which Ballerini himself participated. He took his stand upon Liguori's early writings, and recalled the fact that even Liguori's own partisans claimed that he never changed. Besides, if he did change, says Ballerini, it would be better to follow his original opinion. The same author recurs to the subject in the 1893
editors of Gury's Manuel, to claim the authority of St. Alfonso in favour of the argument; one must, however, be on equiprobabilism as a direct principle of conscience.

As far as the first point is concerned, it may be remarked that this historical question is interesting mainly to biographers of Alfonso de Liogni. The Jesuits and their partisans maintain that St. Alfonso never taught anything but moderate probabilism, and that he repudiated laxity only; the majority of Liogianists assert, contrary to the evidence of facts, that the founder of their order was always an equiprobabilist. Some Liogianists, however, admit that the equiprobabilism of their master dated only from 1762. On account of the want of precision that characterizes St. Alfonso's terminology, it is quite easy to find arguments in his writings in support of all these different opinions.

As regards the second point, equiprobabilism has actually had more opponents than supporters. Among the former we may mention—besides Ballerini—Lehmkuhl, Huppert, Le Bachelet; and among the partisans of equiprobabilism may be named Berti, Heras, and Jansen.

Some of the opponents of the equiprobabilistic system claim that it is only an attenuated form of simple probabilism; others acknowledge the original character of equiprobabilism, but only to demonstrate that this principle is illogical and inapplicable. They hold strictly by the three fundamental rules of probabilism: (1) liberty is prior to law, and cannot be dispossessed of its rights except by an absolutely certain law; (2) a doubtful law is not obligatory; and (3) if a ver e solidi probabilitatis reason exists against law and on the other side of liberty, the law becomes doubtful. The substance of their reasoning is as follows: it is impossible to measure exactly the degrees of probability of different opinions, and therefore a comparison between the reasons which militate for and against liberty is of little value; besides, even if it is possible, in favour of law, the latter remains none the less the only law. One may act even with a certain formido multitatis, for only moral certainty, in favour either of the law or of liberty, excludes this formula, because it excludes any judgment of doubt. Between a simply probable opinion and a morally certain opinion there are no intermediate degrees. In most cases only the so-called reflex principles, and in particular the principle lex dubia non obligat, have practical certainty, which, of course, must not be confounded with theoretical certainty.

To these arguments the equiprobabilists reply that only a comparison between the reasons which can decide if one of them is vere et solida probabilitatis. Practical certainty is of a subjective kind, and to obtain it we must consult our personal feeling. If the law is more probable than the opinion favourable to liberty, there is no real doubt. Now, nothing but real doubt removes the obligatory character of law. It is perfectly possible to oppose an opinion which is not its like and such an opinion is more or less probable than another. It should be noted that equiprobabilists as a rule admit the general principles of probabilism formulated above. Jansen, however, calls attention to the fact that it is incorrect to claim that liberty, being prior to law, has a presumption in its favour (libertas possibilis), and that it is always the existence of law which entirely and wholly establishes itself, according to St. Alfonso, liberty exists only by virtue of law, the source of our rights as of our duties. He does not, as the Roman Catholic moralists usually do, place liberty in opposition to law. He affirms that law is in itself more probable than liberty, and that, consequently, it must prevail if there is another reason in its favour.

Considering the general principle of probabilism, simple probabilism is unquestionably more logical than equiprobabilism. The latter is a timid protest against a purely legal morality, in favour of the subjective conscience, an attempt to stay the abuses inherent in the former and to generate in faith. What makes the controversy which we have just summed up interesting is that at the present time, in the sphere of Roman Catholic morality, equipment is the last instrument behind which the small number of defenders are fighting against the principles and morals of the Jesuits. Probabilism and tutiorism have now no supporters.

LITERATURE.—Delling-Rausch, Gesch. der Moraltheoretiker in der jüdischen Kirche seit dem 2. Jahrtausend, Munich, 1869; the works of Lignori, esp. his Theologia moralis et Homo apologeticus ad ancilariam compositionem illustrobant, ib., 1873; and other treatises of the P. Alphonse de Liogni . . . publicitatis vel primo contrarius vel suae beatae morti, 1 vols., Paris, 1873; Gounet, T.e., 1874; Vindiciae Alphonsianae ad Socian, in Etudes de Droit, Paris, 1874; Vindiciae Alphonsianae ad postea recognicionis Vindiciarum Alphonsianarum, Paris, 1876; see remarkable treatises by P. Grandclaude, Paris, 1873; Jansen, La doctrine moraliste et ab Antonio Ballesteri, Jansenistische Zeitschr., 1878; Rome, 1873; Le Bachelet, La Question liguinaire, Paris, 1879; De l'Etat d'ete en tant que moraliste, 1879; Probabilismus dissertatio historico-critica, Paderborn, 1879; Maxilignon, art. in Etudes (cited above), 1876, the Montef, Feb. 1874, the Civitas Cattolica (on the Vindiciae Alphonseanum) and the Irenes Thoinite, July and Sept., 1879; Jansen, l'Equi-probabilismus, in Revue des sciences ecclésiastiques, 1875; various articles by Grandclaud and Didot, 1857, etc. 12; De l'Equi-probabilismus de St. Alphonse de Liogni; and two articles signed A.O. entitled St. Alphonse de Liogni and its Propaganda. Jansen, 'Probabilismus u. Kritik,' p. 316 f.; and various other articles by the same authors containing this controversy. The Thiel. Quartalschr., 1897, contains an article by Koch, entitled 'Die Entwicklung des Moralismus des hl. Alfonso v. Liogni, auf Grund seiner Briefe dargestellt'; see also arts, 'Lignori' and 'Probabilismus,' in F.R.K.

EQUITY.—In common usage, 'equity' denotes what is right as distinct from what is according to law. The law represents what is enacted by Parliament or the legislature, and, though it may intend to embody the right, it does not always do so, and the courts judge the case according to 'equity.' 'Equity' thus comes to mean some 'law of nature,' as it did in Roman Law, or the consensus of opinions of what is right in the circumstances. The term 'equity,' in its modern distinction is an old one familiar to Greek philosophers and Roman jurists.

Aristotle (Nic. Eth. v. 10) remarks that the equitable and the just are sometimes identified and sometimes distinguished, and that justice and such an opinion is more or less probable than another. It should be noted that equiprobabilists as a rule admit the general principles of probabilism formulated above. Jansen, however, calls attention to the fact that it is incorrect to claim that liberty,
EQUIVOCATION (Logical)—ERASTIANISM

'law' or principle. This supposed 'law' is the mind's sense of right, or some standard assumed to represent it. In speaking of the obscurity and equivocation of the terms, Aristotle says: 'What obscures the matter is that, though what is equi-

called with, but is determination, of that which is just according to law.
The reason of this is that every law is laid down in general terms, while there are matters about which it is possible places to break in general of the terms.' Hence, when a positive law does not strictly apply to the special case in hand, an appeal has to be made to 'equity,' which means some principle of law. The actual enactment is supposed based or which it is intended to serve. For instance, the law may be that a person convicted of murder shall be hanged, but the conviction may be wrong, and, when there is reason to believe this, 'equity' may come in, when process of law will not deal with the matter and remit the punishment.

Sir Henry Maine (Anc. Law, p. 60 ff.) suggests that the distinction held is that equity is the final authority, and sure jurisdiction, the am juris. For supposedly Aristotle treated the case, where the authority, which is the basis of the law, is not what was meant by the law. In the case, where the law is not what was meant by the law, it might mean to be applied in cases of emergency or cases of accident. Hence, when a positive law does not strictly apply to the special case in hand, an appeal has to be made to 'equity,' which means some principle of law. The actual enactment is supposed based or which it is intended to serve. Church of Scotland. With this defence of the Church of Scotland we may compare the words of R. I. Wilberforce, Sketch of the Hist. of Erastianism (London, 1839), p. 76: 'It will be found that Presbyterianism, to whatever other evils it has been open, is at least a deadly enemy of Erastianism. But the Presbyterian is more hostile to the ecclesiastical policy of the State. He is more hostile to the ecclesiastical policy of the State, which is the State of and by the State in all things.'

We may quote also the following passage from Figgis:

'The real object of Erastus was to give clear expression to the denial of any right to coercive authority in the religious society apart from the State. He decided, in fact, to prevent the Evangelical churches becoming what one of them claimed to be in Scotland and actually became in Geneva, a societas perfecta, with all its means of jurisdiction complete and independent. (Cumb. Med. Hist. ii. [1902] 743; cf. also Lee, Pref. p. xxi, and W. Cunningham, Discussions on Church Principles, Popish Erastian, and Presbyterianism, Edinburgh, 1820, pp. 184, 207.)

Figgis's reference to 'the simpler definition of Erastianism as the theory that religion is the creature of the State' (JTAS ii. 83) is hardly the account of the matter which modern religious historians like Freemantle and Gwatkin would admit, though it expresses the tendency of modern political Erastianism which Hobbes propounded in the early doctrine of Leviathan. 'Of Power Ecclesiastical,' 1 as Machiavellianism 2 subordinates morality to political exigencies, so Erastianism, pushed to extremes, subordinates religion.

An attempt at even the most cursory review of the operation of Erastianism is rendered difficult, not only by the persistence and variety of political intervention in ecclesiastical affairs since Christianity was 'renounced' by Constantine, but still more by the notorious fluidity of the term, and by the contradictory judgments of historians and political philosophers as to the determining factors of the ecclesiastical policies of the princes and statesmen — even of churchmen — which are called in question. In the criticism of theorists, too, as we have seen in the case of Erastus, the application and justification of the epithet are often matters of debate. How far a monarch, for instance, was actuated by a genuine desire to propagate Christianity and to extirpate heresy in his dominion; how far he merely subordinated the organization, the central and local ecclesiastical establishment of the Church to the aggrandizement of his personal power or the prosperity of the State — these are problems which not only must frequently remain insoluble because of the psychological and casuistry, but will always be different according to the different conceptions of the mutual relations of Church and State.

The divergent verdicts recorded on the careers of Constantine the Great, Clovis, and Charlemagne furnish conspicuous instances of the difficulty of estimating the quantity or the quality of the Erastianism that has actuated the great makers of Church history. It is necessary, too, to distinguish between the home and the foreign policy of monarchical claims, such as those of William I., Henry II., and Henry VIII. of England; for statesmanship that was Erastian in its treatment of the Church of England was not necessarily, or necessarily, that of the Church of the State itself, though the Church of the State did, on the other hand, Gülzow towards the ecclesiastical policy of the later Byzantine Emperors was, like that of Constantine I. at Nicea, dictated by an honest desire to heal the schisms made in the Church of the State itself by the growing controversy between Church and State, and identified with the party who maintained that political and ecclesiastical authority must outlive the religious, is discussed by Burd, H. Figgis, Notes, p. 67.

1 'Erastianism,' as a by-word, is used to denote the doctrine of the supremacy of the state in ecclesiastical causes; but the word has many meanings, and many between church and state is one on which Erastus nowhere enters. What is known as 'Erastianism' would be better connected with the name of Grothus, as a by-word.

2. Life and work of Erastus.

Erastus was born at Baden, in Switzerland, on 7th September 1524. On his matriculation at the University of Heidelberg, in accordance with the fashion of the time, the Greek equivalent (Erastus) of his family name. In 1544 he quitted Basel and proceeded to Italy, where the general revolutionary movement, referred to earlier, spread over nine years—three at Bologna and six at Padua. First he studied philosophy, and after three years medicine, graduating as doctor in the latter. In 1557, while he held the appointment of physician to the court of the Count of Hainberg, in South Germany, he received almost simultaneous invitations from a number of princes. Declining the offer of the Duke of Saxony, he accepted the professorship of the Elector Henry, the Elector Palatine, offered him at the University of Heidelberg. He was attached to the new faculty of medicine, in the capacity of professor of therapeutics, on 3rd May 1556. At the end of the same year he was unanimously elected to the Rectory for the following year, having already, as Bonnard suggests, received at Heidelberg the degree of doctor of philosophy. He immediately exhibited great ability and energy in the development, not only of the study of medicine, but of culture and science generally, while his election to the Church Council of the Palatinate drew him forthwith into the vortex of those confused conflicts in which Heidelberg, 'a retic for theological eclectics of all nations' (Figgis, p. 69), enjoyed an unexampled pre-eminence.

Erastus, who remained throughout his life attached to the Zwinglian party, of which he was the leading layman at Heidelberg, and chief of the doctrines of the Zwinglians, was always, as Figgis observes, 'the most indispensable community.' In the year 1559 by his opposition to the interlacing action of Hunsen, the Lutheran dean of the faculty of divinity, in attempting to replace the Zwinglian tutor of the children of the Elector Palatine, at Heidelberg, on 12th February, the Elector Otto Henry being succeeded by Frederick IV., the Dean of College Hunsen, the Zwingolian professor of divinity, Frederic was strongly anti-Lutheran. In the Colloquy of 1560 between the Reformed theologians of the Palatinate and the Saxon representatives of the Lutheran church at Bologna, Erastus, at the request of the Elector, defended the Reformed doctrine of the Sacraments, and the independence of the Reformation of Calvinist Osiander (1556-1587), who had been appointed director of the College of Wisdom at Heidelberg. In August the Reformed faith was incorporated, both Lutheranism and the rest of the Roman Catholicism of the Palatinate being proscribed by edict. Two years later Frederick IV. restored the interlude of the Reformed Catechism of Heidelberg, which Osiander and Ursinus had composed, and in the same year (1566) was printed, by the Elector's command, the Itinere von Grottkuchen ("Panphilet on the Preserving of Broad"); of which Erastus was undoubtedly the author. John Marbach of Strassburg, issued the Lutheran rejoinder, which, evoking, in 1566, the second contribution of Erastus to the sacramental quarrel.

The account of the part taken by Erastus in the theological disputes at Heidelberg before the controversy which gave his name a dubious renown is not only indispensable for the right appreciation of his standpoint on the question of excommunication and discipline, but also advantageous for the study of what may be called the normal 'Erastian' character of the Protestant States of Germany. In April 1561, Erastus, as one of the Elector's theological auxiliaries, was prominent at the Colloquy with the Wurttemberg doctors at Mainz, and two years later he accompanied Frederick on his mission to Amberg. The 10th of June 1568 was the red-letter day in the discipline controversy at Heidelberg, when George Withers of Bury St. Edmunds, afterwards Archdeacon of Colchester, but at present a refugee in consequence of the Vestiarian controversy in England, maintained before the University his theses in defence of the authority of the ministers, along with the Presbytery, to perform all that related to church discipline (including excommunication) upon all offenders, not excepting princes. The Heidelberg Catholicoes (Ursinus, Grynicus, Siles &c.) had already pronounced the principle of the excommunication of impious and hypocrites, and had been followed by two successive ordinances, of which the first was of 24th May 1567. Osiander, who, however, was opposed to the second, because reserved to the prince the right of pronouncing excommunication in the strict sense, namely, that of exclusion from the Lord's Supper. It was the debate begun by Withers and continued with the long-sounding flame, Erastus opposed Withers on the second day, a friend having taken his place in his absence. In the dispute thus inaugurated, Osiander, on the side of Withers, was supported by his fellow-Calvinists, Ursinus, Zanchius, Tremellius, and Dathener. Chief among those who held with Erastus were Neuser, Sylvanus, and Willing, with Simon Grynaeus, the brother of J. J. Grynaeus, who had married the sister of the wife of Erastus. The first two were subsequently accused of heresy and excommunication. Erastus, however, although his excommunication was not proven against Erastus, the Olivia in which these associates involved him accelerated the defeat of the anti-discipline. The Erastian order was established by an edict dated 13th July 1570, and the pleas of Erastus rendered nugatory.

Before the end of January 1568, Erastus had all but completed a commentary as he called it, a theological bullinger—against the proposed discipline. His arguments were thrown into the form of one hundred Theses on excommunication. Copies of the work, which he had not intended of publishing, were circulated in manuscript. Soon afterwards the Theses were reduced to seven copies, but unsuccessfully, of anti-Trinitarian tenets.

On 26th October 1576, Frederick III. was succeeded by Ludwig VI. A violent Lutheran reaction ensued; Luther's Catechism supplanted that of Heidelberg, and the Reformed were expelled from the Court and Court. On 31st July 1579, the Elector, having subscribed the Formula of Concord, commanded the University professors to adopt the new confession so recently promulgated. Erastus, like the majority of his colleagues, chose the latter alternative, thus proving that he was no 'Erastian in the ordinary sense.' In 1580 he removed to Basel, where his brother-in-law Grynaeus had died in theology since 1552. At the beginning of 1581 he was admitted into the collegium medicorum of Basel, and in the summer began to teach ethics, of which he was appointed professor in the following January. He died on the 15th March 1583, two days after the first anniversary of his election on the governing council of the University. Though inferior in spiritual insight and moral enthusiasm to many of the second generation of the Reformers, his career justifies the epitaph in St. Martin's Church at Basel, 'Actus Philosophus, Elegans Medicus, Sincerus Theologus, Heidelbergeria Academiae Columna, Basilimensi Lumen.' More than five years after the death of Erastus appeared a volume containing: (1) the seventy-five Theses, with a preface, (2) the Confirmation, and (3) a thirteen letter relative to discipline and the controversy over Erastus by Bullinger, Osiander, and others. The work bore the title: 'Expositio gratissimae questionis, utrums excomunicandi, quatenus religionem intellectuelles et complicatur, sacramentorum sum, proprie adhuc medicinae, medicinae sanitatis et medicinae sanantis, accessorum intersit, ad aureum, ad eumque habendi, ad hominum; autores clarissimi, viro Thoma Erasto B. medico. Oppo. nunc recens expeditus, ad medico autem autographo eremonum obversionem. Osiander ... Positiv. Apud Basileus Sylvanum, anno salutis et 15. Positi, 'Positi' (Positivus) was merely a pseudonym for London, and the following name the anagram for Jacobus Castelvicens, who had married the widow of Erastus. The two theses between Erastus and Beza were those of Excommunication and the Organization of Discipline. Erastus, while recognizing the existence of exceptional cases where excommunication might be exclaimed, was in the right of withholding the Sacrament from professors of the Christian faith who, notwithstanding a moral lapsed, are nevertheless desirous of participating, such desire being,
in his opinion, sufficient proof of their repentance, and the Sacrament being, like the Word, a means of grace intended to benefit all, whereas it is an abuse of it to make it an occasion or instrument of punishment while elsewhere. He holds, in the Law of Moses 1 or in Jewish history is excommunication the penalty for moral offences as distinct from ceremonial disqualification. Further, by a minute dissection (suggestion of the time) of NT passages, Erastus eliminates from the latter also all authority for excluding believers from the Lord's Supper, concerning the significance and efficacy of which sacrament his views are consistently Zwinglian.

Erastus emphatically disclaims any desire to weaken Church discipline. 'Nihil deserit magis quam sub severissima in Ecclesia morum disciplina servetur' (Thes. xvii). But the question at issue is, Who, in a Christian State, is the depository of disciplinary authority? It is here that we reach the problem of Erastianism and of Erastus' relation thereto, for, according to two governments— the invisible, whereof God is the Head, and the visible, whereof the magistrate is the head (and he, ex hypothesi, a Christian)—a State containing two or more distinct visible authorities is an anachronism, as much a monstrosity as a two-headed body: 2

1 God having entrusted to the Christian magistrate the sum of the temporal government, the Church may no means the right to exercise (in a Christian country) a power of repression distinct and independent of that of the State' (Bonnard, 154).
2 Erastus holds that such is the teaching of the OT and the NT. To claim visible power for the Church is tantamount to robbing Caesar of what belongs to Caesar, and the height of usurration is to summon princes to the Church's tribunal and to excommunicate them. The Christian magistrate, though he may be admonished according to the word of God, and may profitably choose pious laymen to assist the ministers in superintending public morals on his behalf, is not to be set in antithesis to the Church as the profane power by the side of the sacred. The Church may warn and censure offenders, but punitive action belongs to the magistrate alone.

Without inquiring how far the objection of Erastus to the exercise of disciplinary jurisdiction by the Church was conditioned by his dislike of the 'principle of equality' at Heidelberg, we must endeavour to trace the connexion between his views on the specific question of the right of the Church to exercise discipline, especially that of exclusion from the Sacrament, and the wider question of the supremacy of the temporal power in matters spiritual—a question touched on incidentally by Erastus, who is more interested in Scriptural disquisitions than in the discussion of principles in politics and history. Both the extent and the boundaries of his contention may be defined as follows. In a State where all profess the true religion, all coerce authority (from which excommunication follows) resides in the magistrate alone, the functions of the Church being restricted to teaching, exhortation, and the due performance of worship. (Only where the magistrate is not a Christian or is unorthodox may the Church substitute its own authority, and in this case, also, the power of excommunication is withdrawn.) Our sketch of the life and teaching of Erastus presents him as an exponent of the Lutheran doctrine of the Supper underlay his antagonism to excommunication, and whose antipathy to the Calvinistic discipline was the exciting cause of his denial, in favour of the magistrate, of the Church's right to any coercive action. Yet his true relation to Erastianism must be sought, not so much in the propositions which the Expiatio and the Confirmatio actually formulate, as in the common orientation, of Lutharians and Zwinglians especially, towards the rival claims of Church and State, a theocracy being rather the Calvinistic ideal. It was not so much the opportunity publication of the writings ('allowed by Whitgift's imprimatur in 1601') as the appearance to the Keats of Erastus by the Arminians against the Calvinists in Holland that gave Erastianism the varying connotation which, since the politico-eclesiastical debates of the eighteenth, and the first part of the nineteenth century, had taken a new shape in Great Britain. The opponents of Arminius and his friends reproached them for appealing 'to the superior magistrate against the ecclesiastical authority' (Figgis, p. 78, note). Both Grotius (who published in 1614 his Erastian tracte de imperio summorum potentatum circa sacra) and Althusius (whose view of the holiness of the State places him, with Luther, the Anglicans, Zwingli, and Erastus, 'between the Devil and the deep blue sea') treat the Arminians with their theory of the Church as societas perfecta regard a Christian commonwealth as a State wherein the clergy form but one class of officers. Though it was Grotius who elaborated what we call Erastianism, he himself does not mention Erastus, and holds other views on excommunication. Nevertheless, the fact that Erastus was the first to assert in a Protestant country the principle of the subordination of the Church to the State entitles him to what ambiguous fame attaches to his memory in the name 'Erastianism.'

3. Erastianism in history. [I.] FROM CONSTANTINE TO THE GENEVA CONFESSIONS IN 1553—CONCERNING THE THEOLOGICAL AND THE ECUMENICAL COUNCILS. Concern with the affairs of the Church was for Constantine and his successors a political necessity. Yet it is easy to exaggerate the actual amount of imperial interference exercised, and to forget the extent to which the motives of the State were in the interests of peace.

The whole question of the State's power over the Church was, when Constantine came to the throne, a very delicate one. The Church, as the most powerful political force in the Empire, was in a position which might be dangerous. Constantine disposed of the problem, by the Edict of Milan 3 in 313, by which the State conferred on the Church and Churchmen all the rights of the Empire. The Edict was not a constitution; it was a step in the direction of ecclesiastical independence. The Church of Rome was placed on the same footing as the other Churches; but the political theory of the Church was still that of the antecedent centuries. The Church was supposed to be the instrument of the State, and the State was supposed to be the instrument of the Church. The Edict was not a constitution; it was a step in the direction of ecclesiastical independence. The Church of Rome was placed on the same footing as the other Churches; but the political theory of the Church was still that of the antecedent centuries. The Church was supposed to be the instrument of the State, and the State was supposed to be the instrument of the Church.
ERASTIANISM was

Braetianism was Eutychian (Cunningham, Tragedy'). Thus

their problem of Church and State presented great diffi-

culties, was an endeavour to secure peace by the

Emperor's endorsement of what appeared to be

the creed of the majority. Nor must we forget that

Athanasius, as Patriarch of Alexandria, was

regarded as wielding an authority that might be
detrimental to the unity of the Empire. The

entourage of the Arian prelate Eusebius of

Nicomedia, with their allies (including Eusebius the

historian, bishop of Casarea), we have the

first instance of what may be called an Erastian

party, their aim being to support the form of Chris-
	

tian faith which, if not to give them the Rome

influence at Court, and, on the other hand, to

strengthen the Imperial supremacy over the

Church. Foakes-Jackson has suggested that the

support of Arianism by Constantius, to whom

the Emperor the principle which

Hosius and Hilary, in their opposition to Con-
stantius, had first asserted, namely, that the

interpretation of Christian things was the concern of

Churchmen. Not without reason did Nestorius, the

Patriarch of Constantinople, who, soon after his transfer-

from Antioch to the capital, inaugurated the

bitter controversies of the succeeding centuries,

give to his autobiography the title "Tragedy."
The vehement wrangles about the Two Natures in

Christ occasioned the issue of the First Council of

Ephesus (431), at which Nestorius was condemned.

Seventeen years later Eutyches propounded the

opposite heresy, asserting that One Nature of

Christ after the Incarnation; and this first form of

Monophysitism triumphed in the tumult of the

"Robber Synod," as Pope Leo (Ep. xev. 2) design-

nated the Council summoned by Theodosius II.

to Ephesus in 449. The change of attitude in the

Theodosian period, and in the

discarding of Nestorius, was probably due to the influence which, before the Council of

431, Cyril had succeeded in exercising upon the

Imperial ladies. But the death of Theodosius in

450 brought about a speedy reversal of his policy.

The Empress Pulcheria and her consort Marcian,
supporters of the doctrine of Two Natures, decided
to summon another Ecumenical Council, and that,
too, against the wishes of Leo, who preferred

the question at issue should be determined by the

authority of his Rome, rather than by the decision of

a Council dominated by the Emperor and Em-

peror.' Thus the official line of the

Emperor with paganism by abdicating

the title of Pontifex Maximus, and Theodosius had

supported his youthful colleague (an apt disciple of

Ambrose) in refusing to replace the altar of

Victory in the Senate. Honorius (395-423) and

Arcadius (395-408), the sons of Theodosius, who

succeeded to the rule of the West and the East

respectively, differed, like the brothers Valentinian

and Valens, in the extent of their cooperation with

the Church—the Western Emperor, according to

the rule that prevailed, henceforth being the less

pragmatical. Nevertheless Honorius, besides con-

vening the conferences with the Donatists (411),

whose remission he vainly sought to repress by

an edict of 418 banished Pelagius and his

principal followers, notwithstanding their recent

acquittal by Zosimus, the vacillating Pope who

for his time did nothing to stem the

Italian bishops to subscribe his anti-Pelagian

Epistola Tractator (417). But more important, for

our inquiry, attacks to the reprimand ad-

duced by Honorius to Arcadius after the con-

demnation of Chrysostom had passed, were

unwarrantable control exercised by the Emperors of the East

over the Patriarchs of Constantinople and the Greek Church

during the half-century following. Though, while in this country it is generally

known by the name of Erastianism (Cunningham, p. 164; see

also p. 209).

5 Bury, Hist. of the later Roman Empire, London, 1889, i. 105.

6 Alice Garnier, "Religious Dissension in the Fifth Century," in

Orthodoxy on the restoration of the worship which her husband had temporarily checked.

For the orthodox Eastern Church, because of her cultus, her Monophysitism, and her dependence upon the Emperor, 'it was easy to be,' as Omar says, 'as no other people ever been in the Church, and at the same time non-political' ('The Church and the Divine Order, London, 1911, p. 134')—words that recall the statement of Freeman ('Historical Essays,' ii. 288, London 1901).

'To the Eastern Romans the orthodoxy of the Eastern Church made up for the lack of nationality in the Eastern Empire. The sway of Christ and the Church went together. The true Byzantine mind the two ideas could barely be conceived asunder.'

(b) The struggle of the Empire and the European kingdoms with the Papacy.—The iconoclastic controversy forms a significant transition, from the history of the developing Byzantinism that dominated the religious life of the later Roman Empire in the East, to the history of the titanic conflict of the Romano-Germanic Empire with the Papacy. As King of the Franks, Charles the Great had already vindicated his headship over the Frankish Church, nor had he hesitated to reject the decisions of the Ecumenical Council of 787. He passed over the Frankish ecclesiastical councils, and even in the Papal domain exercised all the rights of the lord of the land. The fact that there was at the moment no Emperor in the East, and the necessity of securing Charles’s personal support, have been a factor in determining the action of Pope Leo III. (755–816) in crowning him Emperor on Christmas Day, 800. On the death of Charles (814), we pass from the hardly challenged supremacy of the Emperor over the Church to the Church’s assertion of her right to temporal supremacy as well as to absolute spiritual authority over Emperors and princes. The interests of the separate countries, too, both within and without the Empire, were all alike imperilled by the growing claims of the Papacy, from Nicholas I. (858–867) to Innocent III. (1189–1216); but the question of Byzantinism itself, in any given circumstance of domestic policy, is complicated by the phenomena of feudalism and the rise of national Churches. Notwithstanding the strong hand with which monarchs like William the Conqueror dealt with ecclesiastical affairs, a very real limitation of regality was involved in a recognition, however grudging, of the Papal supremacy. An obvious effect of the success of the Papal pretensions was the entailment of Erastianism on the German Empire. The brute of the struggle fell upon the German Emperors, because of the unique relation which they bore to the Popes, who were regarded, by princes outside the Empire, as foreign potentates exercising in the separate realms a jurisdiction more or less resented. To the Emperors the Popes were allies, for neither the rivals themselves nor the theorists who severally supported them envisaged the struggle as a contest waged by two different societies. But, though it would be a misreading of history to speak of the conflict as between Church and State—having regard to the prevalent theoretical conception of the right of the Holy Roman Empire as one society with two functions, sacerdotium and imperium, discharged by different officers—the crux of the struggle was, nevertheless, the recognition of the supremacy of the spiritual or of the temporal power in the State. The representative anti-Papal theories,1

1 Freeman holds that, had it not been for the Romanizing influence of Edward the Confessor, as he held, England would have become as subordinate to the State as was the Eastern Church ('The Norman Conquest,' v. (Oxford, 1876) 491 f.).

2 The magnitude of the medieval literature relating to the controversy may be inferred. The bibliographic compilation of C. E. 1S98J, 'Monophysite Controversy,' and the dissertation of A. H. Harnack, 'The Monophysite Controversy;' the debates over the controversy in the American Council of 1885, no less than 100 Publicists, Legists, and Canonists from the 17th to the 19th centuries, (Glorieux-Mailland, Political Theories of the Middle Age, Cambridge, 1890, pp. 1331–1367).
which we shall briefly summarize, demonstrate the strength of the dialectical defence of the right of princes, and the force of public opinion allied with them. Time after time did the temporal power at height the fact if negative superiority, as is instanced in the death in exile of Gregory VII. (Hildebrand, 1073–1085), who accused Henry IV. at Canossa (1077), and of Alexander III. (1159–1181), who humbled Frederick I. (Barbarossa) during the period he was engaged, by the Babylonian captivity of the Popes at Avignon, the blow to royal prestige that was involved in the fall of Frederick II., the last of the Hohenstaufen (1212–1250). From the earlier days of the Church herself, that the State was co-ordinate with her, and from the original idea of a pre-existent harmony between the two powers, both policy and speculation drifted to the more and more enthusiastic assertion of their distinctness and even opposition. It will suffice for our present purpose to review the anti-Papal theories of two great Italians and two great Englishmen—Dante (1255–1321) and Maritain (1882–1973) and William of Ockam (died after 1342); William of Ockam (died in 1347) and John Wyclif (1324–1387).

(a) The De Monarchia of Dante is not only ‘the most purely ideal of political treatises ever written’ (R. B. Gardner, Dante, London, 1909, p. 660), but it is among the epilogue or epitaph of the Empire as the earthly Kingdom of God, and ‘a prophecy of the last days of Christendom, and of that doctrinal war between the Divine kingdom and the kings, which formed for long its theoretical justification against clerical pretensions’ (C. F. G. Fromm zu Ermstedt, Cambridge, 1907, p. 20). The first book shows that the temporal monarchy—whereof the Empire is the unique embodiment—is necessary for the well-being of the world, the second, that the Roman people, under the jurisdiction of whose Emperors Christ designed to be born and to suffer, succumbed by divine Will to the empire of the world; the third, that the authority of the Roman Monarch or Emperor depends immediately (sine ullo medie) on God and is subsidiary to the Emperor, man’s two necessary guides of life, corresponding to the two celestial and the two terrestrial powers of the State. It was the conflict between John xxii. (1316–1334) and Ludwig of Bavaria (1314–1347), who attempted to depose each other, that made the De Monarchia, hitherto almost unknown, an armament of international arguments, the supporters of Ludwig including William of Ockam, whom Pope Clement regarded as having inspired Maritain of Padua.

(b) Maritain of Paris (whose Defense of Papacy was, by the command of Henry viii., published in an English translation, The Defense of Peace, by William Marshall, in 1539) anticipates, in its polemics, the intellectual climate. He maintains not only that coercive power belongs exclusively to the State, but even that no compulsion may be exercised in the Church. Sovereignty rests with the whole body of citizens, acting as the faithful lawyer, and the prince should be responsible to the former for his judicial power over the Church. Papal decrees have no temporal effect, and all bishops are equal.

c) William of Ockam opposed the cause of Ludwig of Bavaria against John xxii., by whom Ockam and Michael of Cesena, the Quaestiones de Rebus Temporalibus (d. 1321) from Avignon during the minority guarded on the subject of clerical power, this being the cause of Ockam’s opposition to the Papal claim to unlimited potestas potestatis, both temporal and spiritual. He contends that the whole hierarchy, from the Pope downwards, is a human order, and not immediately Divine. Were the Pope’s power unlimited, he could depose princes, and reduce Christianity to an unprecedented slavery. Ockam would even advocate a college of Bishops in preference to a monarchical Papacy. The ordinary judge of the Pope is the Emperor, but the Church has jurisdictio over him. In case of necessity he could be deposed by a General Council representing the whole Church. Inasmuch as every society can make laws for itself, the Church, assembled as a General Council on the basis of parishes, could appoint a successor. Ockam maintains that Church law is just as much the law of the State. His principles are not only subversive of Papal domination, but also assenting to the fact that the true faith resides among the people. He succeeded in being unseated as bishop of Paris (1317), although he had already been unseated as an advisor to the King of France. He published his Quaestiones under the name of God’s ancient virtual community. (d) Wyclif has been accounted more Erastian than Erastus. In his de Officio Regis and other tracts he asserts the king’s right to all the power of the Church. He held that the right to withhold revenues from unworthy ecclesiastics and to depose clergymen was an advance against contemporary anti-Papal theories consists in his extension of the State’s option over the Church.

Not content with maintaining the State’s autonomy in civil affairs, Wyclif contested the right of the Church to interfere in the administration of the Church when she neglects her duty. The State’s jurisdiction in religious matters is plenary, and it does not leave the Church to the mercy of the ministerium, not a dominium, but this ministerium the secular lords may remove from irreligious clerics. The link between Wyclif and Luther is supplied by John Hus (1373–1415), whose tracts, de Ecclesia, de Potestate Papae, and De Servo de ablatione temporis, show how completely he had absorbed Wyclif’s anti-Papal teaching.

(ii) THE REFORMATION.—(a) Germany. It was inevitable that the Reformation should be established in the various German States, as in other countries, only by the help of the secular power. If the German princes and nobles had not responded in sufficient numbers to the call of the French king, and if Charles v. had not honoured Luther’s safe-conduct to Worms, the attempts of Luther at reform would have proved as fatally futile as did the premature efforts of Arnold of Brrescia and Savonarola. Luther’s Address to the Christian Nobles of the German Nation (1520) bore immediate fruit in the list of grievances against the Roman see which the States drew up two years later at the Diet of Nuremberg. On the ground of the priesthood of all believers, Luther appealed to the German princes to undertake the reformation of the Church—the duty which the bishops refused to perform (Luther died after 1541). From this point of view the Reformation, at least in its principle was adopted which forms a landmark in the history of the Reformation—that, in the matter of putting in force the Edict of Worms, whereby Luther was placed under the ban, each component of the Empire was left to itself.

(b) England. So closely is Erastianism interwoven with the history of the Church of England, that the record of its operation here is to a great extent conterminous with the ecclesiastical history of the kingdom, the English kings having always claimed a visitatorial authority over the Church. Before Henry viii. the greatest assertors of the independence of the Crown against Papal jurisdiction from without and clerical influences were William the Conqueror, Henry ii., and Edward iii. The first two were concerned with the problems of civil and ecclesiastical (1308) the principle of Erastianism being also occupied with the matter of

1 A fundamental theory of the German Reformation was that of the transference of episcopal jurisdiction from the bishopric to the Protestant States. It was Luther who first expressed it by the princes of the power, which, though naturally theirs, had been usurped by the clergy. After the Compact of Passau (1552), pressed merely to restore to the princes their inherent ecclesiastical rights, was passed, the Holy See, with the consent of the German princes, was deposed, and our author supported this view at the expense of the Neo-Lutheran position of John E. S. Ryle, that the entire Church is under the imperium of the State, that the State has a priori jurisdiction in all the fields of human activity.

2 Cesius regius unus religio is a maxim as fatal to true religion as it is to freedom of conscience. It is the cement of despoticism, the formula in which the German Prince Express the fact that they have the power and willingness to act in reliance upon their power, against the State (the passing of the Edict of Worms in Germany, in Cont. Mod. Hist. [Cambridge, 1903] 278). On the important diplomatic correspondence which intervened in the Polish question, see Lindsay, Hist. Reformation, Edin. 1869, i. 389 note 2.

3 Longman, Life and Times of Edward iii., Lond. 1868, ii. 93-95.
investitures. Hildebrand recognized the right of lay investiture as a privilege enjoyed by English kings, while William rejected Hildebrand’s claim to suzerainty over England. The conflict of Church and State waged between Becket and Henry ii. centered in the legislation of the Canon and the Law, together with the numerous claims to privileges or immunities made by the Church on the basis thereof, especially as regards the civil impor-
tance of the clergy.

The sixth session of Henry viii.’s Reformation Parliament (1534-1535) witnessed the culmination of the breach with Rome, the Act of Supremacy giving the King the title of ‘Supreme Head on earth of the Church of England,‘ while the Prayer Book, under which Fisher and Moore were con-
demned, included, under the category of treason, maliciously depriving the sovereign of any of his royal titles or calling him a schismatic. With Henry’s ecclesiastical legislation, Erastianism in England enters upon a new phase. Even before the rupture with Rome had been consummated by Clement vii.’s refusal of the divorce with Katherine, Cranmer declared himself as ‘Supreme Head,’ and reluctantly acquiesced in the ‘Submission of the Clergy’ (1532). In Elizabeth’s Act of Supremacy (1558) her father’s claim to the head-
ship of the Church was declared to be ‘Supreme Governor of this realm as well in all spiritual or ecclesiastical things or causes as temporal,’ but section 20 of the Statute recognized the limitation of the royal prerogative in matters of doctrine, reserving the right of the clergy in Convocation to assent. While the professed purpose of the Statute was to restore ‘to the Crown the ancient jurisdiction over the State ecclesiastical and spiritual, and all spiritual and temporal power repugnant to the same,’ it was the monarch’s personal authority, rather than that of Parliament, that was herein enhanced, and the Acts of Supremacy, both of Henry viii. and of Elizabeth, were im-
portant factors in Tudor absolutism. On the other hand, the developments of Protestantism in Puritanism, Independency, Quakerism, and other move-
ments towards religious and political liberty and equality, effected the ultimate overthrow of the Stuart dynasty. Now were laid the foundations both of modern Erastianism and of the manifold opposition to it. Even when Hooker published his ‘Hermeneuticks’ (1595-94), the fundamental assumption of his Erastianism (not unlike the basis of Arnold’s idea of a Broad Church co-extensive with the nation) was already falsified by the fact that the State, even as viewed by Pro-
testant, was no longer of one religion. From the beginning of Elizabeth’s reign the interminable controversy of Church and State assumes a new signification. It no longer hinges upon the rival claims of Pope and Emperor or King. The vindica-
tion of the spiritual autonomy of presbyters, of congregations, and of individuals against the authority of Sovereign, Parliament, or Magis-
trate compelled inquiry into the true nature of the Church of Christ. Yet it must not be forgotten that, as Hutton says, ‘the English Revolution was thoroughly Erastian in its treatment of the Church question,—an absolute contrast to the Scots.’ The Erastianism of the Independents was in great measure due to their anti-Presbyterianism.
4Prothero, Select Statutes and other Constitutional Documents Illustrative of the Reigns of Elizabeth and James 1, London, 1871.

king and bishop, refused to abdicate its supremacy cæsar sacris.

(c) Scotland.—In no Protestant country has greater opposition been shown to the very sugges-
tion of Erastianism than in Scotland. Not only the Secession of 1560 and the Disruption of 1843 (the latter especially being, in the first instance, a protest against lay patronage and intrusion), but also the growing effort on the part of the Established Church to free itself from State control, shows how deeply engrained in the Scottish religious consciousness is that idea of the essential autonomy of the Kirk which John Knox acquired during his exile in Geneva. The revolt against Erastianism in Scotland may be said to have begun when the Scottish Estates, on 25th Aug. 1560, abolished the Papal jurisdic-
tion and the Mass.1 But it was especially in connexion with the repeated attempts of the Stuart Kings of England to establish prelacy that the term ‘Erastianism’ acquired in Scotland its evil connotation.2 Resistance to successive Acts which were under-
stood to be aimed against the Presbyterian Church of Scotland was especially instigated by the heroism of a series of movements—those of the Covenanter, the Protes-
ters, the Conventicles, the Hamiltonians, and the Cameronians.

No one has discerned more clearly the tre-a
d in the discussion of the relation between Church and State been in any country more learnedly, eloquent-
ly, and judiciously handled than in Scotland. Prob-
ably no Church in Christendom is in this respect more ecclesiastically minded, in the true sense of the term, than the Presbyterian Church of Scot-
land, whether Established or Free. The current opinion of many modern English ecclesiologists, that the Established or non-Free Church in England can only almost complete autonomy, is a mistake. On the question of State aid it has been tersely expressed that the Established Church of Scotland was non-
voluntary, the Free Church was voluntary on conditions, and the United Presbyterian Church was voluntary without conditions.3 Apart from the Disruption of 1843, when resentment at the decision of a legal tribunal was of the essence of the movement, no Corporation of Church establishment was shown on the part of the United Free Church against the claim of a majority of the lay tribunal of the House of Lords (1st Aug. 1904) to controver determine the development of doctrine in the Free Presbyterian Church of Scotland. Thus the religious history of Scotland exhibits opposition to Erastianism, whether the State control be exerted legislatively or administratively.

ERROR AND TRUTH.—Both in its philo-
sophical and in its popular acceptation the word 'error' is applied to false opinions. But popular usage also extends it to the term a wider meaning, whereby it includes not only false opinions, but numerous forms of practical failure, and of defective conduct, whose relations to conscious beliefs are by no means constant or easily discoverable. The derivation of the word illustrates the natural-
ness of associating the conception of a false opinion with the idea of some such act as wandering, or straying, or missing the way. It seems, therefore, as if a first approach to a sharper definition of 'error' would be aided by clearly distinguishing between the practical and the theoretical applications, and then confining the philosophical use of the term, so far as possible, to theoretical errors. But the difficulty is, that even theoretical error without reference to some genuinely practical considerations. However much we try to avoid popular confusions, we shall be led in the end to a concept of error which can be stated only in t. logical terms, and which involves the idea of action for an end, and of a certain defect in the carrying out of such action.

The present article, after distinguishing, as far as possible, the concept of theoretical errors, or false opinions, from the popular concept of practical errors, and after stating some of the best known views regarding what a false opinion is, will seek to indicate more particularly the nature of the problem in terms of a doctrinal basis which forms the relation of the cognitive to the volitional processes.

1. Practical errors and false opinions.—When one emphasizes the practical aspect of an error, one sometimes makes use of the more drastic word of 'blunder.' A blunder is something which involves serious maladjustment, defect in conduct. Errors in the sense of blunders may be due to false opinions or to ignorance of true facts: but it is largely consist of such. On the other hand, they must need involve false opinions, and must involve actions which do not attain their goal. These actions may be only partly voluntary; but the relation of their defec-
tive action to the accompanying volun-
tary processes is what makes us call them errors. Thus, we speak of the error or blunder of the marksman who misses his mark; of the player who fails to score, or who permits his opponent to score when the game calls for some device for hindering the opponent from scoring. We speak of the mistakes error when he sings or plays a false note. Such errors may, but often do not, result from, or accompany, false opinions or misjudgments. Thus one may fail as marksman, as player on the other hand, there may be, or an error due to confusions, either through mistakes, or else through defects of physical training, of temporary condition, of mood, or of attention—defects which may involve no false opinions whatever. In the moral realm, the relations between such practical errors on the one hand and false opinions on the other are especially momentous and intricate. Here, in fact, the theory of moral error involves all the main problems about the relations between knowledge and action. A sin is very generally called an error. 'We have erred and strayed from thy ways like lost sheep.' The error is, first of all, practical. It has also some relation to knowledge. Yet, since sin appears to depend upon a deeper study of knowledge of the right, the 'error' in question does not merely result from a false opinion about what one's duty is. On the other hand, that sin involves 'unwilling,' and so does the sin of the sinner. It depends upon false opinion in its generally asserted. Any careful discussion of those practical errors which have a moral significance will, therefore, show that it is not merely accidental confusion which has led to our use of a word derived from our experience of wanderings from the right path as a term which is also to be applied to false opinions. Opinions certainly express themselves in actions; and voluntary actions are guided by opinions. The resulting relations of cognition and volition, especially in the moral world, are amongst the most complex and intricate which are known to us anywhere. They are relations which we can neither ignore nor wholly disentangle. Hence the clear separation of theoretical error and practical error, at least in the moral world, is impossible. For sin involves both theoretical and practical defects.

We can, however, make some approach to such a separation of the theoretical and practical aspects of error if we turn for aid to a very different realm, namely, formal logic. The distinction between true and false is a fundamental distinction of the best known general relations, such as formal logic considers and analyzes. We may use these relations for what they are worth in attempting to define what a false opinion is. Having thus laid the way through some of the more complex regions of the problem of error.

The distinction between true opinion and false opinion obviously depends upon, but also is obvi-
ously not identical with, the formal logical distinction between true and false propositions. This close relation and important difference between these two distinctions appears upon a brief study of the considerations which formal logic employs in dealing with the concepts of truth and falsity. True and false are, for the formal logician, predicates belonging to propositions, quite apart from the basis for further analysis, we may attempt to clear the way through some of the more complex regions of the problem of error.
reciprocal or 'symmetrical'; (4) of two contradictory propositions, one is true and the other is false. These may be here regarded, if one chooses, merely as defining principles, explaining what one means by propositions, i.e., propositions to be used in logical predication 'true' and 'false.'

Granting these purely formal principles, of which all exact reasoning processes make constant use, it is obvious that propositions may be collectively as a system constitute an ideal realm wherein to every truth there uniquely corresponds its contradictory falsity, and to every false proposition its contradictory true proposition. The realms of truth and falsity are thus formally inseparable. To know that a given proposition is false is to know that the corresponding contradictory is true, and vice versa. Omniscience regarding the realms of truth would, therefore, equally involve knowing true propositions as true and false propositions as false; nor could the one sort of knowledge be defined or real without the other.

But no such formal logical necessity appears to connect right opinion and error. No one can know that 2+2=4 is true without thereby knowing that 2+2 # 4 (that is, the contradictory of the former assertion) is false. But we can conceive of a computer that could make any errors in computation, and such a computer might even be supposed so perfect, in the possession of some superhuman infallibility of computation, as not even to know what it would be to err in his additions. We ourselves, when we use the assertion 2+2=4 as an example of a peculiarly obvious proposition of computation, find this bit of summation one about which it is rare or difficult for a man deeply to err in. Yet for us the knowledge of the truth of the proposition 2+2=4 is logically inseparable from the knowledge of the falsity of the contradictory of this proposition.

In sum, then, true and false propositions are logically inseparable. To possess a knowledge of truth is, therefore, inseparable from the possession of a knowledge of what falsity is, and of what false propositions mean. But a being can be supposed to know truth and falsity, and their distinctions and relations, without having any tendency to fall into error. At all events, no purely formal logical reasons, such as for the moment concern us, can be given for supposing that a being who is capable of knowing truth would be capable of falling into error. The more concrete distinction between true opinion and error must, therefore, be different from the formal logical difference between truth and falsity. The latter may be viewed as a logically necessary distinction between inseparable objects. The former must be due to motives or causes, and must imply mental tendencies and situations of which formal logic, taken in its deliberate abstraction from the fullness of life, gives no account.

The concept of a false opinion is thus obviously distinct from that of a false proposition, and not every true opinion requires that the corresponding false opinion should be held by somebody. It is the purpose of advancing science, of education, of the propagation of truth, to diminish and, so far as may be, to destroy, the minds of men from which error arises. If this purpose were somehow miraculously attained, there would be as many false propositions in the formal logician's ideal realm of truth and falsity as there ever were; but human errors would have ceased.

2. The leading definitions of error.—To define false opinion, hereupon, as the acceptance or the mistaking of false propositions for true ones, or of true ones for false ones, is precisely as objectionable as ever was; but human errors would have ceased.}

accept a false opinion as true—what is this but simply to make a mistake, or to hold a false opinion? This supposed definition is but a tautology. Not thus is the nature of error to be clarified. Further light is thrown on the nature of error through (1) defining more exactly the distinction between true and false propositions; and (2) showing upon what further distinctions the conception of error depends, and, in the light of these, how to accomplish this result must next be summarily stated and criticized.

(1) The 'correspondence theory of truth and falsity' and the definitions of error based upon it deserve to be stated, because they are familiar, and because they have formed the starting-point for supplementary doctrines and definitions and for corrections. According to the view now in question, a proposition is true if it reports, or describes, or portrays 'facts as they are.' The emphasis is laid upon the 'as.' A true idea 'corresponds in its structure to the thing, or reality, or fact of which it is a true idea; a true proposition is one which asserts that an idea does not correspond to the facts, when it actually so corresponds. Or, again, if the account given by a proposition conforms to the structure of the facts of which it attempts to be an account, the proposition is true. Thus, a proposition may relate to the number in a real flock of sheep. In this case an idea, gained by counting the sheep, is first formed, and then the assertion is made that this numerical idea represents the real number of sheep present in the flock. The correspondence of the idea with the facts constitutes that to which the assertion is committed. If the correspondence exists, the assertion is true.

Such being (according to the 'correspondence' theory) the nature of truth, error takes place when, because of inadequate observation of the sheep, or because of some other psychological defect on the part of the one who counts, a numerical idea which does not correspond to the real number of the sheep arises in the mind that is subject to the error; while, because of these or of still other psychological motives, the false proposition, 'Such is the number of the sheep,' comes to be asserted. That the correspondence does not exist makes the proposition false. That this non-existent correspondence, or belief, or knowledge, or opinion has to exist constitutes the essence of the error.

In order to understand what error is, and how it arises, one therefore needs, according to this view, to analyze the nature of belief, and the motives which lead the erring mind to make assertions. From this point onwards, the definition and the theory of error have always required the consideration of various associative, affective, or volitional factors of the process of making and believing assertions—factors of which pure logic, considered in its usual abstraction, can give no account. In brief, the nature of truth and falsity once having been thus defined, the nature of error depends upon some dispositions to accept or to deny an untrue proposition—a disposition which cannot be due to the merely logical nature of the untruth itself, but must be referred to the prejudices, the ideas, the biases, the devices, the habits, or the other psychological fortunes of the erring subject.

What further accounts, upon this basis, have been attempted as explanations of error, there is here no space to set forth at length. A few points must be noted. One may assert: (1) that error in such a case as the foregoing, or in the more complex cases of superstitions, supposed theological heresies, false philosophical doctrines, false scientific opinion, false political doctrines, etc., may be mainly due to a negative cause—the mere
ignorance of the erring subject, his lack of 'adequate ideas,' are the absence of correct and sufficient portraits of fact. What a man lacks he cannot use. If he has no ideas that correspond with the facts in question, how can he make true assertions? Error is then, at least in the main (so long as we confine our consideration to the question under private). For instance, may not even attempt to count the sheep in the flock. I may merely guess at random. In such a case, error seems to be due merely, or almost, to a lack of ideas. But, an error is not a false theory of error was worked out by Spinoza, and applied by him, as far as possible, to decidedly complex cases. Naturally, according to Spinoza, the order and connexion of ideas corresponds to the order and connexion of things. This, for Spinoza, is the case with even the most worthless of our human imaginations. But, for psycho-physical reasons, which Spinoza discusses at length, most ideas of the ordinary man, relating to his world, are extremely 'inadequate;' that is, such ideas correspond only to very fragmentary aspects of the real world. The majority of men live ignorant of God and of themselves, and of things. This ignorance prevents them from possessing the stock of ideas which could furnish the basis for true opinions. Men fill the void with errors. Yet none of their errors is without basis in fact. The idea of a judge, without any regard to that of which they know not, just because they know so little. This doctrine of error as ignorance, if accepted, would give us the most purely and completely theoretical definition of error which has ever been offered.

Plainly, however, ignorance is not of itself error. I cannot err concerning facts of which I know so little as to have no idea whatever about them; just as I cannot, in a speech, make grammatical blunders of which existence I have never heard. Some other factor than ignorance determines the actual acceptance and utterance of false propositions. This even Spinoza himself has in the end to recognize. In his study of the errors of human passion, he makes the mechanical associative process, and the resulting passions themselves, factors in the genesis of error. Thus we are inevitably led to other theories.

One may assert: (2) that error is due to whatever moves the will of the erring subject to make assertions even in the absence of ideas that correspond to real objects. This volitional theory of error plays an inextricable part in the dogmatic doctrine that error was obviously useful in giving reasons for the moral condemnation of the errors of heretics, infidels, and schismatics; and has, in fact, an obvious and important basis in the psychology of opinion. Descartes recognized it in connexion with his own form of the doctrine of the freedom of the will. Spinoza, who rejected the theory of free will, and defined both intellect and will in terms of his psycho-physical theory of the associative process, still on occasion was obliged, as just pointed out, to use his own version of the doctrine of 'human bondage' as an explanation of the fatal errors into which the play of our inadequate ideas and of our passions leads us. In other forms this theory of error is widely accepted. From this point of view an error is a willful assertion of a false proposition—an assertion made possible, indeed, by the erring subject's ignorance of the ideas that do correspond with reality, but positively determined by his willingness to assert. False beliefs are thus due to a combination of ignorance with the will to believe.

One may insist: (3) that the affective processes which condition the mood called 'belief' are the principal factors in making a false proposition, when it chances to be suggested, seem plausible. Where error is propagated by social contagion, or is accepted through reverence for authority, more so much the will as the emotional life of the erring subject seems to be the factor which makes error possible. Here, according to the previous view, ignorance is an idea that does correspond with reality, hence becomes a condition of error, but constitutes neither its essence nor its sufficient cause. An error, according to the present view, is a false opinion which, because of its appeal to the sentiments, the feelings, the passions, the will of the erring subject, because it is harmonious with his social interests or with his private concerns, wins the subject over to the state of mind called belief.

One may further maintain: (4) that the principal cause of error is whatever associative, perceptual, or imaginative process gives such liveliness, strength, and persistence to ideas which as a fact do not correspond with reality, that the erring subject is forced, in the absence of sufficient corrective ideas, or (to use Taine's expression) for lack of 'reducers,' to regard these ideas as representative of reality. Theories of error founded upon this view may have played a prominent role in the psychical literature which deals with the genesis of pathological forms of error, and have been prominent in the teachings of the Associationist school generally. From this point of view, error is due to the correspondence of the erring subject through the mechanism of association, and mainly because no other ideas than those which this assertion declares to correspond with the facts can win a place in the subject's mind when he thinks of the topic in question.

The foregoing accounts of the nature and source of error have all been stated with explicit reference to the 'conventional facts.' This theory supposes that the test of truth is the actual conformity of a representative idea with the object which it is required to portray. Idea and object are viewed as distinct and separable facts, just as a man and his portrait or photograph are possessed of a separate existence. The representative idea is external to the object. Truth depends upon a certain agreement between such mutually external facts. And, just as the idea to whose truthfulness as a representation a proposition is committed is external to its object, so, as we have now seen, the motives which lead to error appear, in the accounts thus far given, to be external to the truth or falsity of ideas and propositions. The falsity of a proposition, so far as we have yet seen, gives no reason why the error involved in believing that proposition should be committed. The truth of a proposition, also, in no wise explains why the true proposition comes to be believed—unless, indeed, with Spinoza, one comes to accept, for metaphysical reasons, a theory that ideas are by nature in agreement with objects. In case, however, one does accept the latter theory without any limitation, then error can be defined only in negative terms as due to mere absence of ideas. Such an account of error, as we have also seen, is incapable of telling us what it is, and is inadequate to explain the most familiar facts about its occurrence.

If, then, the truth or the falsity of a proposition does not of itself explain why it is true or a false belief, the existence of error, for one who accepts the correspondence theory of truth, has to be explained by psychological motives which are as external to the logical meaning of true and false propositions as the ideas. The correspondence theory of truth are external to their objects. Some propositions are true. Their contradictions are false. So far, we have a system of facts and relations that seems, according to this
account, to be wholly independent of the psychological processes of anybody. But of these true and false beliefs, the subject is already somewhat acquainted with the constitutions of the object, and is aware what propositions are true about the object quite apart from the psychological fortunes of the poor subject, whose escape from error is to be added to such other causes. As a fact, philosophers who give such counsel very often behave for the moment as if they, at least, had not to wait for a slowly acquired conformity with the reality, but were already assured of their own grasp of the object, and were therefore able to give such good advice to the erring psychological subject. No purely psychological theory of the way in which a conformity to an external object can be gradually acquired through clear ideas, freedom from prejudices, and so on, can serve to explain how the critic of human truth and error has himself acquired his assumed power to see things as they are, and thus to guide the psychological subject in the right path. That sort of attainment of truth which this theory attributes to the philosopher who teaches it is just what it does not explain.

In fact, a little reflection shows the answer: when we hold, as we very rightly do, that a certain wise conduct of our ideas, feelings, will, observations, processes of recording observations, and other such mental enterprises helps us towards truth, it only tells us to avoid error, we are comparing, not ideas with merely external objects, so much as less coherent with more coherent, unified, clear, and far-reaching forms of experience, of cognition—in general, of insight. If we once see this fact, we have to alter our definition of truth, and herewith our definitions both of true opinion and of error.

Truth cannot mean mere conformity of idea to external object: first, because nobody can judge an idea merely by asking whether it agrees with this or with that indifferent fact, but only by asking whether it agrees with that with which the knowing subject meant or intended it to agree; secondly, because nobody can look down, as from without, upon a world of wholly external objects on the one hand, and of his ideas upon the other, and estimate, as an indifferent spectator, their agreement; and thirdly, because the cognitive process, as itself a part of life, is essentially an effort to give to life unity, self-possession, insight into its own affairs, control of its own enterprises—in a word, wholeness. Cognizance does not merely to represent its object, but to attain, to possess, and to come into a living unity with it.

Accordingly, the theories of error which have been founded upon the 'correspondence' theory of truth must be, not simply abandoned, but modified, in the light of a richer theory of truth. A true proposition does, indeed, express a correspondence between idea and object, but it expresses much more than this.

(ii) Another definition of truth, which has its foundation far back in the history of thought, but which has been of late revised and popularized under the names of Pragmatism, Humanism, and Instrumentalism, may next be mentioned. According to this view, an idea is essentially something that tends to guide or to plan a mode of action. A proposition expresses the acceptance of such a mode of action. It is founded on a less sharply defined end. Now, a mode of action inevitably leads to consequences, which arise in the experience of the active subject. These consequences may be called the 'vindication' of the view which tended to guide or to plan this mode of action. These workings may agree or disagree with the intent of the idea. If the idea agrees with its expected workings, that idea is true, and with it the proposition which accepts that idea as
suited to its own ends is true; otherwise the idea and the proposition are erroneous. Such is the definition of truth which is characteristic of Pragmatism.

The case of the right or wrong counting of the flock of sheep will serve to illustrate the present theory. If true opinion and true belief are to be exemplified by the representative theory of the same matters. A flock of sheep is not merely an external object to be portrayed. It is, to the one who counts it, an interesting object of human experience. He counts it in order to be ready to estimate his possessions, to sell or to buy the flock, to know whether he needs to hunt for lost sheep, or because of some other concrete purpose. His counting gives him an idea, perhaps of what he ought to ask of a purchaser, or of a plan for the shearing or for the market, perhaps of whether he ought to search for missing sheep. When he accepts and asserts that some determinate number represents the actual number of the flock, he, no doubt, takes interest in the correspondence between the idea and the object; yet his real object is not the indifferent external fact, but the flock of sheep as related to his own plans and aspirations. The practical results of these plans. The only test of the truth of his count, and, in fact, the only test that, when he counts, he proposes to accept, is that furnished by the workings of his count. Does his idea of the number of sheep, when accepted, lead to the expected results? One of these results, in many cases, is the agreement of his own count with that made by somebody else, with whom he wishes to agree concerning a sale or some other enterprise. Or, again, he expects the enumeration which he makes at one time to agree with the result obtained at some other time when he counts the flock anew. Furthermore, a habit of inaccurate counting betrays itself, in the long run of business, in the form of failure to get expected profits, or in the form of a loss of sheep whose straying is at one time not noticed because of the inaccurate counting; while later experience shows, in the form of the experience which traces the loss, the non-correspondence of expectations and results. Such expectations, tests, and agreements define the sort of truth that is sought.

What so simple and commonplace an instance illustrates, the whole work of the natural sciences, according to the pragmatist, everywhere exemplifies. The Newtonian theory of gravitation is accepted as true because its ideas lend, through computations, to workings which agree with observation. The older corpuscular theory of light was rejected because certain of its consequences did not agree with experience. The same process of testing hypotheses by a comparison of expectations with outcome can be traced throughout the entire range of empirical investigation.

As to the cause and essence of error, upon the basis of this theory of truth, there can be, according to the pragmatist, no very subtle difficulties to solve. The whole matter is, upon one side, empirical; upon the other side, practical. Experience runs the course, and error does. We, the truth-seekers, are endeavouring to adjust our actions to empirical happenings by adapting our expectations, through the definition of our ideas, and through the forming and testing of our hypotheses, to the observed facts as they come. As we are always in our practical life looking to the future, and are seeking the guidance which we need for our undertakings, our propositions are hypotheses to be tested that certain ideas will, if tested, agree with certain expected workings. If the test shows that we succeed, then, just when and in so far as we succeed, our propositions prove to be true and there true. If we fail, they prove to be errors.

Truly and falsity, and, consequently, true opinion and error are not 'static' principles, or fixed classifications of our ideas or of our hypotheses. Both the ideas and the propositions 'come true' or 'fail to come true' through the fluent and dynamic process of the empirical test. Thus every truth and every falsity, and every falsity false, is relative to the time when, and the purpose for which, the individual idea or hypothesis is tested. Absolute truth or permanent truth, and equally absolute falsity or permanent falsity, are not concepts. From this point of view, purely abstract and ideal predicates, useful sometimes for formal purposes, when we choose to define our purposes in terms of logical or of mathematical definitions. Concrete truth and error are of the nature of events, or series of events, or of 'the long run' of experience. That many of our ideas should not 'work,' or that many of our hypotheses should result in disappointed expectations, is, for the pragmatist, merely an empirical fact, requiring a special explanation no more than do the marksman's misses or the player's failure to score. We are not perfectly skilful beings; experience is often too fluent or too novel for us to catch its drift. This ignorance, or error, leads us, he says, to this is not more frequently the case. That man is as skilful a player as he is of the game of ideal expectations and anticipated consequences is a mark of our stage of development, but failure is as natural an event as is success.

The traditional accounts of the psychology of error mentioned above are readily accepted by Pragmatism, precisely in so far as they are indeed accounts which experience justifies. No doubt, ignorance is a source of error. We are, in fact, ignorant of all except what experience, in one way or another, permits us upon occasion to prove by actual trial. This ignorance permits errors, in the form of false expectations, to arise. Prejudice, emotion, willfulness, and the associative process unite to engender expectations which may prove to be false. Nor is there any known cause that uniformly ensures the attainment of truth. The difference between success and failure in our adjustment to our situation is simply an empirical difference. We have to accept it as such. No deeper account can be given than experience warrants.

The result of the pragmatist's definition of error obviously forbids any sharp distinction between theoretical and practical errors. The presence or absence of the ideas lend, through computations, to workings which agree with observation. The older corpuscular theory of light was rejected because certain of its consequences did not agree with experience. The same process of testing hypotheses by a comparison of expectations with outcome can be traced throughout the entire range of empirical investigation.

The result of the pragmatist's definition of error obviously forbids any sharp distinction between theoretical and practical errors. The presence or absence of the ideas lend, through computations, to workings which agree with observation. The older corpuscular theory of light was rejected because certain of its consequences did not agree with experience. The same process of testing hypotheses by a comparison of expectations with outcome can be traced throughout the entire range of empirical investigation.

As to the cause and essence of error, upon the basis of this theory of truth, there can be, according to the pragmatist, no very subtle difficulties to solve. The whole matter is, upon one side, empirical; upon the other side, practical. Experience runs the course, and error does. We, the truth-seekers, are endeavouring to adjust our actions to empirical happenings by adapting our expectations, through the definition of our ideas, and through the forming and testing of our hypotheses, to the observed facts as they come. As we are always in our practical life looking to the future, and are seeking the guidance which we need for our undertakings, our propositions are hypotheses to be tested that certain ideas will, if tested, agree with certain expected workings. If the test shows that we succeed, then, just when and in so far as we succeed, our propositions prove to be true and there true. If we fail, they prove to be errors.
and results. These happenings, or 'the long run' of such happenings, constitute all that is concretely meant by truth and error. Whether one says, 'This proposition is true or false,' or, 'This opinion is true or false,' the concrete fact to which one refers is the sequence of ideas and the evidence submitted when their expected workings are compared with the expectations. Since logicians like to abstract certain 'forms' from the matter of life, they may, if they choose, define the entities called truths and false propositions. Suppose then to the students of the concrete the study of the fortunes of mere opinions. As a fact, however, according to Pragmatism, propositions live only as opinions in process of being tested. The distinctions with which we began this discussion have their own provisional usefulness, but only as abstractions that help to prepare the way for understanding life. A proposition becomes true in the concrete when the opinion that it is true leads to expected workings, and becomes false when the belief in it leads to workings which do not agree with expectations.

Second, in sum, is the pragmatist's solution of our initial problem. It emphasizes very notable facts regarding the relations between logic and life, and between thought and volition. Yet it fails to satisfy. For it can only presuppose and constantly presuppose certain assertions about experience, about the order, the inter-relations, the significance, and the unity of empirical facts to be true, although their truth is never tested, in the pragmatist's sense of an empirical test, at any moment of our experience.

Thus it has been necessary to assume, even in the view of Pragmatism about truth, that ideas can be formed and submitted to the test of experience at another time, and perhaps by another person, just as Newton's hypotheses were formed by him, but were tested, not only by himself, through a long course of years, but by later generations of observers. It has been necessary to assume that one can form expectations today, and compare them with facts to-morrow, or next year, or after whatever length of time the conditions make possible. But this assumption requires the truth of the proposition that the meaning, the object, the purpose, the definition of the ideas and expectations of one moment, or period of time, or person, not only can be but are identical with the meaning, object, purpose, definition of the ideas and expectations of another moment, temporal region, or person. Now such an assertion, in any one case, may be regarded with indifference, but if it is, for human beings, unverifiable. Nobody experiences, in his own person, or at any one time, the identity of the ideas, meanings, expectations, of yesterday and to-day, of himself and of another person, of Newton and of the later students of Nature who have tested what they believe to be Newton's ideas. One may, in each special case, doubt, therefore, whether the idea formed yesterday is the same in meaning as the idea formed to-day, whether two men mean the same by the hypotheses which they are trying to verify together, and so on. But this much seems clear: however doubtful, in the single case, any such proposition may appear, unless some such propositions are true, there is no such process as the repeated testing of the same ideas through successive processes of experimenting and testing, at moments of time, or in the experiences of various human observers.

But in that case it is not true that the proposition, 'Such a testing of ideas by the course of experience as Pragmatism presupposes actually takes place,' expresses the facts. If, however, this proposition is not true, the whole pragmatist account of truth becomes simply meaningless. On the other hand, if the proposition is true, then there is a kind of truth whose nature is inexpressible in terms of the pragmatist's definition of truth. For there are propositions which no human being at any moment of his own experience can ever test, and which are nevertheless true.

Much the same may be said of the pragmatist's assertion regarding the 'workings' that an idea is said to 'possess,' or to which it is said to 'lead.' These 'workings,' by hypothesis, may extend over long periods of time, may find a place in diverse minds, and may involve extremely complex reasoning processes (e.g., computations, as in the case of the Newtonian theory of gravitation) which are very hard to follow, and which no human mind can survey, in their wholeness, at any moment, or submit to the test of any direct synthetical observation. The proposition, however, 'These are the actual and, for the purposes of a given test, the logically relevant workings of the idea that is to be tested,' must itself be true, if the empirical comparison of any one of these workings with the facts of experience is to be of any worth. The truth of the proposition just put in quotation marks is a truth of a type that no one man, at any instant, ever personally and empirically tests. In every special case it may, and in general, it should be, regarded as doubtful. Yet, unless some such propositions are true, Pragmatism becomes a meaningless doctrine; while, if any such propositions are true, there is a sort of truth of which Pragmatism gives no account.

What holds of truth holds here, in general, of the conditions which make falsity possible. And the whole theory of true and false opinion, and consequently the theory of error, must be modified accordingly. In brief, Pragmatism presupposes a certain unity in the meaning and coherence of experience taken as a whole—a unity which can never at any one moment be tested by any human being. Unless the propositions which assert the existence and describe the nature of this presupposed unity are themselves true, Pragmatism has no meaning. But, if they are true, Pragmatism presupposes a sort of truth whereof it gives no adequate account. To say this is not to say that Pragmatism gives a wholly false view of the nature of truth, but is only to insist upon its inadequacy. It needs to be supplemented.

(jii) Over against the theory of truth as the correspondence between a wholly external object and an ideal portrayal, and also in contrast with Pragmatism, there exists a theory of truth which defines that concept wholly in terms of a harmony between the partial expression of a meaning which a proposition signifies and the whole of life, of experience, or of meaning, which, according to this theory, ideas and propositions intend to embody so far as they can. A proposition is true in so far as it conforms to the meaning of the whole of experience. Such conformity can never be attained through the mere correspondence of a portrayal with an external object. It can exist only in the form of the harmonious adaptation of part to whole—an adaptation that can best be figured in the form of the adaptation of an organ to the whole of an organism.

If one reverts to the comparatively trivial instance of the sheep and the counting, the present view would insist, as Pragmatism does, upon the fact that, in counting sheep, one is attempting to adjust present ideas to the unity of an extended realm of experience, in which the observed sheep appear, now as grazing in the field, now as having their place in the herdman's enterprises, now as passing from one ownership to another, and so on. The one who counts wants to get such a present
ERROR AND TRUTH

idea of the sheep as will stand in harmonious unity with all else that can be or that is known with regard to them. The truth involved in the process of counting is itself of a relatively abstract and lower sort; and hence is ill adapted to show what truth really is. For, in fact, to treat sheep merely as numerical objects is to treat them as what, on the whole, they are not; hence to say, 'They are so many'; is to make some respect false. For they are sheep, and to say this is to say that each is a living organism, a unique individual, a product of ages of evolution, and a being possessing values beyond those which commerce recognizes. Hence a numerical account of them has only 'partial truth,' and therefore is false as well as true. The only wholly true account of the sheep would express (not merely portray) their character as facts in the universe of experience and of reality. One can say, at best, of the proposition about their number that it is true in so far as it expresses a view about them which harmonizes, to the greatest extent possible for a numerical statement, with what experience, viewed as a whole, determines the place and the meaning of one's present experience of the flock of sheep to be.

The truth, from this point of view, is an attribute which belongs to propositions in a greater or less degree. For single propositions, taken by themselves, give us abstract accounts of facts, or rather of the whole in which every fact has its place, and from which it derives its character. A proposition is an interpretation of the whole universe, in terms of such a partial experience of the nature of the whole as a limited group of ideas can suggest. This interpretation is always one-sided, precisely in so far as the group of ideas in question is limited. In so far as the partial view harmonizes with the whole, the proposition is true. Since the partial view, being one-sided, can never wholly harmonize with the whole, each separate proposition, if taken in its abstraction, is partially false, and needs to be amended by adding other propositions.

This general theory of truth and falsity, while its sources run back into ancient thought, is especially characteristic of modern Idealism. That the truth of propositions about experience is a character determined by their relation to the ideal and abstract whole of experienced apprehension, 'is a thesis which forms part of Kant's 'Deduction of the Categories.' The later developments of the 'Dialectical Method,' by Fichte and Hegel, and the analogous features of Schelling's thought, led to more explicit theories of the relations between truth and falsity, and to the doctrine that every proposition, considered in its abstraction, is partially false, and needs amendment. Hegel, in the preface to his Phänomenologie, asserted that 'Das Wahre ist das Ganze,' and interpreted this as meaning that only what a survey of the total process of experience signifies enables us to know truth, while 'partial views,' such as we get on the way towards absoluete Wissen, are at once true and false—true, as necessary stages on the way to insight, and therefore as in harmony with the purposes of the whole; false, as needing supplement, and as showing this need through the contradictions which give rise to the dialectical process. In Hegel's Logic this view of truth is technically developed. With a different course of argument, with original features, and with a more empirical method of investigation, a view of truth and error which belongs to the same general type has in recent times been developed by Bradley.

If one can develop such a theory of the 'degrees of truth and falsity,' and of truth as the harmony of organic unity between a partial view and the ideal whole of experience or of reality, the essence of error—that is, of false opinion—must receive a new interpretation. In the history of the development of Absolute Idealism, the conception of error has taken, on the whole, two distinct forms.

(1) According to the first of these forms, usually emphasized by Hegel, error exists merely because it is a partial view, and in some respects false. For it is the whole truth, as the total and final view, precisely in so far as the partial view inevitably passes through the stage of 'abstraction,' in which it defines itself to the exclusion of all other points of view than its own. Did it not pass through this stage, it would not be a live or concrete view of things at all. It simply would not exist. But (according to Hegel) the whole, in order to be an organism at all, requires the parts to exist. And, if the parts are—as in the case of opinions—partial views of the whole, and if the whole requires them to exist, each in its place in the system of spiritual life, it is the whole itself, it is the Absolute which requires the partial view to make it true, to assimilate the essence of regarding itself as true—that is, as an absolutely whole view. If a man is merely counting, he takes his objects simply as numerical; and then real things present themselves to him, as to the Pythagoreans, as merely 'numbers.' Such a view, as an abstraction, is false; but as a stage on the way to insight it is inevitable; and as a concrete phase of opinion it is an error, that is, a positive belief in a falsity, or, again, a taking of a partial view for the whole. To be sure, this 'dwelling on the abstraction,' this beharren oder vereinre in the midst of falsity, is a phase; and since, for Hegel (just as much as for the Pythagoreans, the Pragmatists, the Anglo-Saxons, etc.) is a living process, not a question of things held in such a phase must pass. An experience of the 'contradictions of finitude' must in due time arise, and must lead to the recognition that the partial phase is false. This is what happens in the course of the history of thought, when the successive systems of philosophy—each a partial truth, required by the necessity of the thought-process and by the life of the Weltgeist to regard itself as absolutely true—successively another with a dialectical necessity that tends to larger and truer insight. The same sequence of necessary errors, which are all of them partial truths taking themselves to be whole and final, and in so far, in the 'unity of essence' to the 'abstraction,' to the doctrine that every proposition considered in its abstraction, is partially false, and needs to be amended by adding other propositions.

(2) To Bradley, and to others among the more recent representatives of Idealism, to whom the dialectical method of Hegel appears in various ways unsatisfactory, this account of the partial, in which error arises, and, as a phase of experience and of life, is necessary, does not appeal. For such thinkers, error is, indeed, defined as a partial and (in so far) false view, which is not merely partially false and partially true, but takes itself to be wholly true. The existence of such a dis-harmony between part and whole, in a realm of experience where the metaphysical presuppositions in which errors or appear seem to the writers accepts them to the end and towards absolute Wissen, are at once true and false—true, as necessary stages on the way to insight, and therefore as in harmony with the purposes of the whole; false, as needing supplement, and as showing this need through the contradictions which give rise to the dialectical process. In Hegel's Logic this view of truth is technically developed. With a different course of argument, with original features, and with a more empirical method of investigation, a view of truth and error which belongs to the same general type has in recent times been developed by Bradley.

As a statement of the ideal of truth which is alone consistent with rational demands, the Idealism thus summarized seems to be, in great measure, successful. But its success is greatest with respect to the whole of our conception of truth, its organic harmony or adjustment of a partial to a total view of experience and of its meaning. Precisely with regard to the problem of the possibility of error, that is, of disharmony between any partial interpretation of experience and that which is revealed and fulfilled by the whole of
experience, the idealistic theory of truth and of error has proved to be, thus far, most incomplete.

3. Conditions of a solution of the problem of error.—The foregoing survey shows that a satisfactory theory of error must meet the following requirements:

1. It must be just to whatever interest in a decisive and unquestionably 'absolute' distinction between true propositions and their contradictory false propositions is justly primary.

2. It is no account of truth and error in terms of 'partial views' and 'the total view' of experience must be used to render the contrast of true and false anything but a decisive contrast, as sharp as that between any proposition and its contradictory.

3. The theory of error must take account of the actual unity of the cognitive and the volitional processes. It has been the office of recent Pragmatism to insist, in its own way, upon this unity. But Hegel, in his Phänomenologie, also insisted, although in another fashion, upon the fact that every insight or opinion is both theoretical and practical, is an effort at adjustment to the purport of life, an effort to be tested by its genuine rational success or failure.

4. The theory of error must recognize that truth is a character which belongs to propositions so far as these are seen in themselves, and that the whole of truth is in their relations to experience, and not in their relations to wholly external objects.

5. That the rational test or the success of ideas, hypotheses, and opinions lies in their relations not to momentary experiences, but to the whole of life, as far as that whole is accessible, must also be maintained.

6. Theoretical error cannot be separated from practical error.

7. A revision of Hegel's dialectical method, a synthesis of this method with the empirical senses, a Pragmatism, a modification of both with the methods of modern Logic seem, in their combination, to be required for a complete treatment of the problem of error. An error is the expression of a voluntary action, a belief. In case of an error, a being, whose ideas have a limited scope, so interprets those ideas as to bring himself into conflict with a larger life to which he himself belongs. This life is one of experience and action, its whole nature determines what the erring subject, at his stage of experience, and with his ideas, ought to think and to do. He errs when he so feels, believes, acts, interprets, as to be in positive and decisive conflict with this end.

The conflict is at once theoretical and practical.

J. ROYCE.

ESCHATOLOGY.—The principal subjects treated of in this article are the 'last things' strictly so-called—the idea of judgment and retribution, and the idea of the catastrophic end of the world and its renewal, and how the dead are related to that end of all things. The different views regarding the state of the dead are discussed in the article STATE OF THE DEAD (see also BLEST; ARBODE OF THE; MESSIAH; RESURRECTION).

1. Savage races. 11. Retributive notions.—The question of the existence of the idea of future retributive justice among savages is not easily settled, as certainly, in some cases where it is believed in, it may be traced to outside influences. Hindu, Buddhist, Muhammadan, Christian, here the idea must have been latent or already expressed in some form, else it would not so easily have been adopted. While a mere continuance of present ethical conditions is frequently believed in, distinctions according to rank, wealth, or power are commonly found. The future of the soul is also dependent upon the nature of the funeral offerings, or upon burial or non-burial, or upon the person having been tatted, circumcised, mutilated in some particular way, or provided with certain amulets. An approach to a retributive doctrine is found in the wide-spread view—extending upwards to the ancient Teutons and Mexicans—that cowardice dears from Paradise or incurs actual punishment; courage being here a savage virtue which is rewarded. Again, since gods and spirits frequently punish in this life sins (not necessarily strictly moral) that would not be punished in ourselves—tabu-breaking and the like—it was easy to extend this to the future life. Hence, neglect or contempt of worship, ritual, tabu, etc., is often punished in the other-world, or keeps souls out of the more blissful state.

This is a common belief in Melanesia and Africa (see ERE II, 1931; Brown, Melanesia and Polynesia, 1918, p. 155; Polynesia (Cills, Pol. Researches II, 1902, i. 606), and in S. America (Naup skies, La France equatoriale, Paris, 1887, ii. 192). In certain cases crimes which are detected by the tribe, and therefore by the tribal gods, or which are severely punished on this earth by torture or death, are also believed to be punished beyond the grave—a natural deduction. These crimes are mainly murder or theft committed against fellow-tribesmen, sorcery, adultery, incest, as well as lying, and even niggardliness.

For examples, see Brown, op. cit. 195; Codrington, Melanesia, Oxford, 1910, p. 274; ERE II. 654—Post, Grundriss der eth. Jurisprudenz, 1892 and Leipzig and London (1894 and 1895); Rink, Tales and Trad. of the Eskimo, 1924, p. 4; see also ERE IV. 255—256. Metanesians (fierce savages of the Philippines) is also alleged among the Andaman Islanders (Man, 17 xii. (1933) 158, 162), Australians (Parker, More Aust. Legendary Tales, 1896, p. 90), and the Zulus, Salish, katsina (a white tribe), (Harrison, 17 xxi. (1934—5) 17; Wilson, TES III. 300), Motives of Malacca Indians (Amer Ethnol, 13 (1925), 559), Massel (Merker, ZEB XXVII, (1903) 735). In most of these instances the nature of the punishments points to native ideas. In some cases the 'wicked' are simply annihilated (Grinnell, Vavoom Hero Stories, 1893, p. 355).

A judgment is necessarily implied where a division on various grounds, or actual punishment by the gods, or exclusion from Paradise is believed to take place in the other-world; but it is only sporadically that it is expressly stated to occur (Konds (Hopkins, Rel. of India, Boston, 1908, p. 530), Chippewa (Dunn, Ont. Ind. 1908), Guinean Negroes (Pinkerton, Voyages, xvi. 401). Annua (ERE I 322). Some of the West African secret societies probably teach a future judgment.

Out of such primitive views the idea of judgment in the higher religions was evolved.

The judgment may simply be an examination by some being or animal, to discover the inner truth and has the necessary distinctive mark which admits to Paradise, or has those certain things according to custom in this world (Codrington, op. cit. 256, 297, 326, 380; Price, Nature, 1908, iii. 326 (Maclean, 1908, p. 326), and in other cases some ordeal, appointed occasionally by a divinity or spirit, has to be undergone, which tests the man's fitness for the blissful region (Schonburg, Religion in its Glimpse, Leipzig, 1849, iii. 318; Thomson, The Fijians, 1908, pp. 121, 125, 128). Or it may consist in sending the dead to some other place in the world of spirits, and the bad by another leading to a place of pain (Mooney, 1907, 534 (Harce); Condrou, op. cit. iv. 192). Or, again, the bridge
which the dead must cross becomes an ordeal, the bad being unable to cross it, or they are repelled by its guardian (Laudan, Holle and Fugger, Heidelberg, 1900, p. 61; ERB I: 439, f. 13r-s). The Book of the Dead is always here made mortal, but: the beings who examine and test the soul are primitive judges of the dead, only the right and the left hands, and other undesirable persons from the blissful region, and force them to remain apart or in an undesirable place, or to wander restlessly from place to place. It is the spirits of persons who perished in life by the new arrival who inflict such punishments—a natural extension of the idea of blood-revenge, surviving also in higher religions (Coleridgion, 589, 274 f., 279, 288; Brown, 444 [New Guinea]; Conard, RHR xiii. [1900] 288 [Algonquins]; cf. Lev. 26: 14).

(b) The Final Catastrophe.—The Andaman Islanders believe that spirits, apart from souls, go to a gloomy jungle below the earth, which is flat. But a time will come when a great earthquake will cause the world to turn over. The living will perish and change places with the dead. Spirits will be re-united with souls, and live on the renewed earth, in which sickness and death will be unknown (Man, JAI xii. 161 f.). Many American tribes (north and south) expected a catastrophic end of all things—frequently by fire, as the world had before been destroyed by water. But in such cases it was believed that, as certain persons escaped death by flight to the earth, so some would be hid from the fire and re-people the new world (Scholecraft, Indian Tribes, 1833-36, i. 319, iv. 240, 420; Brinton, Myths of New World, Philadelphia. 1847). In one Choctaw legend the dead spirits were to resume their bodies and live on the renewed earth. A similar re-appearing of the purified and renewed world after its final destruction by water was believed in by the Eskimos (Brinton, 302; Egede, Nachrichten von Greenland, 1760, p. 158; Boas, ‘Central Eskimo’, 6 RBBW (1888) 586 ff.). Probably Christian teaching has here influenced existing native beliefs. The Mexican belief in a series of world-ages with gods, bodies, and spirits extinguished by a catastrophic, from which only a few were rescued for the new age—is akin to these. The Mexicans did not know when the existing age would terminate, but only that it would be at the end of a cycle of 52 years; nor does it appear how the dead would fare at this consummation. This conception of the end of the world-age seems to have been unrelated to the myth of the return of Quetzalcoatl and the renewal of the Golden Age (J. G. Müller, Amer. Urkunden, Basel, 1855, p. 511 f.; see AGES OF THE WORLD [Prim. and Amer.]). The Peruvians also believed in a former destruction of the world by water, and in its future destruction, signaled by an eclipse of sun or moon, in which the sun or moon would vanish, the moon fall on the earth, and a conflagration or drought would follow, in which all would perish (Müller, 396; Brinton, 254). It is obvious that such myths are extensions of the observation of actual catastrophes and unexplained natural phenomena, and of the terrors inspired by them.

2. Egyptian.—Of any Egyptian doctrine of a final catastrophe there is no record. The idea of judgment of the soul after death appertained to the Osirian faith from the time of the XVIIIth dynasty, though it is found in connexion with the Ra doctrine in the Book of the Gates. In this the judge takes place in the Hall of Osiris—the sixth domain through which the soul passes on his nightly journey; but in the Book of the Dead the judgment was preparatory to entering the true paradise of Osiris—the Fields of Aunet.

3. Teutonic.—Though the general view of the division of souls at death among the Teutons is non-moral, glimpses of a more ethical division and of a daily judgment after death by the gods are obtained. Crimes, such as omissions against kinship—mighty ones from gods above. The righteous now dwelt in Osiris, the wicked were condemned to N-strand.

How far this has been moulded by Christian influences is still uncertain. Most probably floating eschatological myths have been fixed in an orderly narrative by the poet of Vidugri under ancient Teutons. There is a certain connexion between eschatology, while a world-catastrophe is hinted at in tales which have no connexion with Vidugri (Grimm, Tent. Myth., Gr. Leg., 1859-98, pp. 453, 815).

4. For Celtic eschatology, see art. CELTS, in vol. iii. p. 308.

5. Greek and Roman.—In the earlier Greek poets, Homer and Hesiod, nothing is said of judgment. But such enemies of the gods as the Titans are shut up in Tartarus (Hes, Theog. 715 ff.; Homer, H. xiv. 275, cf. vii. 12), while Tityus, Tantalus, and Sinopus suffers torment (Od. xi. 576 ff.). Minos in the under world gives laws to the dead (θυματουργὸς θεον), but he does not appear to act as judge (Od. xi. 567 ff.). But, under the influence of the Mysteries and of the Orphic and Pythagorean cults, the ideas of judgment and retribution became prevalent, and are found in later writers. Pythagoras taught a judgment of the dead (Po. fr. 299 V.); the judgment is depicted on the vase on which Xacos, Tripolemus, and Rhdamantus appear as judges (J. E. Harrison, Pro. to Study of Greek Rel., Cambridge, 1908, p. 609). In the Mysteries it was also taught that the unfitted were thrown into the profane, and the unjust were punished in the Other-world. Generally the judges, who exist independently in Plato's kingdom, are said to be the Three Judges who appointed Xacos—and they were appointed to this office because they had acted justly on earth (cf. Plato, Gorgias, 492). But the Mysteries also adopted the formula of the three judges as true judges in Hades (Asp. 41). They give judgment in a meadow at the parting of the ways, one of which leads to the

orsis, who were backed to places or thrown into pits or a lake of fire. How far such a retribution could be overcome by words of power is uncertain. These punishments are referred to in the Book of the Dead, but it must be remembered that they could not be eternal, for the soul was annihilated. How judgment was actually effectuated is not stated, but it occurred again in the Book of the Gates and the Book of That which is in Dust we hear of the horrible punishments by which the annihilation of Rogarchie was made sure; and the same idea is certainly included in the wicked. This annihilation, according to Brinton, is caused by the conclusion of a theology of the interpretation of a Nature-myth of the sun attacking with his rays and fiery glance. See also the whole scene of the judgment described as a journey to the Underworld, as well as the story of a visit to Aleria. "The gods, as far as possible, punish (cf., further, art. Egyptian Religion, p. 542, and Ethics and Morality [Eth.], p. 478.

3. Teutonic.—Though the general view of the division of souls at death among the Teutons is non-moral, glimpses of a more ethical division and of a daily judgment after death by the gods are obtained. Crimes, such as omissions against kinship—mighty ones from gods above. The righteous now dwelt in Osiris, the wicked were condemned to N-strand.
the torments of this place are also referred to
(vi. 19). The latter views differ widely through the gradual introduction of the belief in transmigration, while Yama is now the judge of the dead. The popular view is represented by various passages in the Satapatha Brahmana. The dead pass two fires, which burn the wicked, but let the good go by: they are weighed in a balance, and their fate is thus decided. The good pass to bliss; the wicked suffer in hell, or are re-born as a punishment. In certain cases, re-born in suitable conditions, in heaven, hell, or on earth, appears as the result of ignorance of the true end of existence, viz. release from the chain of cosmic existence and absorption in the world-soul. Hinduism in all its forms endorses this view. All go to Yama over a dreadful road, on which the pious fare better than the wicked. Yama or Dharna judges and admits the fate. Through endless existences and re-births—in human, animal, or plant forms—alternated with lives in the heavens or hells, the soul must pass. The Hindu doctrine of the Four Ages is connected with eschatology. The Four Ages—Krita, Tretā, Dvāpara, and Kali, each with its own period, extend over a period of 12,000 years, each of which is equivalent to 300 human years, thus resulting in a period of 4,320,000 years. A hundred such periods form a kalpa. At the close of the age of righteousness, or more precisely, at the close of the final kalpa of a kalpa, there is an apparent destruction of the world by fire and flood. The gods are absorbed by Brahman, along with their heaven and all good persons in it. Then follows the age-long sleep of Brahman (equal to a period of a kalpa), after which he re-creates the world. The process of transmigration begins anew, and all are re-born in higher or lower forms, to renew their cosmic existence, save those who desire final and absolute absorption in the Supreme (see SBE vii. 77 f.; xxv. pp. lxxxiv, lxxxvii; xxxiv. 212; Hopkins, op. cit. 419 f.; Barth, Rel. of India, 1882, p. 93; Ages of the World [Indian]).

7. Buddhism.—In Buddhism the idea of karma afforded an automatic principle of judgment, whereby the person after death entered upon an existence, higher or lower, according to his actions. At death, the force resulting from actions combined with clinging to existence causes creation of the five skandhas, or constituent elements of being. This is so swift that one's life is hardly removed. The continuity of personality, which is thus re-created in one of the six states—gods, men, animals, plants, pretas, or inhabitants of one of the hells. The shortest term of punishment in a hell is 500 years, but one may rise by this to that in a higher state, while a life in heaven may be succeeded by a life on earth or in one of the hells. But already in early Buddhism we find the idea—taken over from Brahmanism—that the warden of hell drag the wicked before Yama, who condemns them to one of the hells (Monier-Williams, Buddhism, 1889, p. 114 f.). But it is in Northern Buddhism that this idea is most particularly developed. Here there is the conception of a judgment of the soul after death in the courts of the ten judges of the dead, one of whom is Yemo (Yama). He judges with strict impartiality, and also fixes the hour of dissolution.

After the deceased is clad in the black garment of sins, or in the shining garment of good deeds, the latter are weighed against evil in a balance. If the sins exceed, punishment follows: if good deeds, release from the pangs of existence. Scenes of punishment are painted on the walls of temples, depicted in books, or formed with clay figures. The dwellings of the hells are arranged like earthly temples. There is also a belief in a judge over which souls pass; the good cross it easily, but the wicked fall from it to life. No soul can ever return after existence in heaven or hell, this also being fixed by the judge. This conception of judgment is also found among the

From Source:

"The Ideas of the Orphics and Pythagoreans are reproduced by Pindar (see Ol. iii. 52 f.) and other poets. The Orphics held that the original soul and retribution are connected with that of metempsychosis. Ten thousand, or, in the case of pure souls, three thousand, years elapsed before the soul is finally united with its body, which appears at the place of life, when the soul was rewarded, or punished in places of correction (εἰς τὰ δόρα γίνεται διάσωσις). At the end of a thousand years the soul chose a new body, human or animal, and was born on earth, to undergo further probation there, and to be rewarded or punished once more at death. Some souls, however, were too wicked ever to return, and remained for ever in Tartarus (Plato, Phaedrus 241 f.; Rep. xiv. 525 c, and \( \) for a reference to similar teaching in the Mysteries, Laws, ix. 870).

In the Phaedo (67f., 113) the soul is led by its own laws to the place of judgment, and is then sent to either the purification or the purgatory. The Stoics held that evil souls were punished after death, but punishment was, however, purgatorial, though bad souls might become extinct. Seneca speaks of death as a day of judgment when sentence will be pronounced on all (Ep. xxvi., Herc. fur. 727 f.; see Zeller, Stoics, 1870, p. 205 f.). The Epicureans rejected all such views, and taught that the soul died with the body (Lucr. iii. 417 f.; cf. Hippol. Refut. Her. i. 19). While the Roman people their native religion taught nothing of judgment and future penalties, the poets accepted the Greek ideas and the names of the judges of the dead, and frequently referred to them. Thus in Vergil's picture of the under world, Minos judges those who enter the Elysian Fields, Rhadamanthus in Tartarus (En. vi. 426 f., 540 ff.; see other passages collected in Ruhl, De mortuorum judicio, Giessen, 1903, p. 76 ff.).

The conception of the end of all things was philosophical rather than popular and mythical, but the Stoic doctrine of the τελευτάω became popular. How was the conception of the future life related to the cyclic change?

In Plato's theory of the two ages ever recurring, those who died in the period of disorder, when the universe was left to itself, were in the new age—the Golden Age—born from the earth as old men, and grew ever younger. The end of each period, when the earth began to move in an opposite direction, was marked by great convulsions of Nature. In the Stoic doctrine of the cyclic configuration, all souls (or those which have not become extinct) are then resolved into the World-Soul or Prime. Fire. This world-catastrophe over, the formation of a new universe begins (Cicero's renovatio), and all things repeat themselves as in the old world (cf. Seneca), and every person again finds himself in his former status. Did this include personal identity? Some answered that the persons were distinct, without a difference, others regarded them as different (see Zeller, 155 ff.). Seneca, who gives a vivid picture of this world-conflagration (Comed. ac. Merciorum, seems to have looked forward to the day (Ep. xxxvi. 10). See Area of the World (Greek and Roman).

6. Hinduism.—Although in the Rigveda no clear statement of judgment is found, and Yama appears mainly as king of the region of bliss, yet he is to some extent an object of terror, and a dark underworld hell is spoken of as the fate of evil-doers (Ixx. 5, vi. 160 f. 362). In the Mahabharata.

1 Plato says that Rhadamanthus judges souls from Asia, and that his jurisdiction is extended to Europe, while Minos, as the oldest, decides difficult cases (Corg. 524).
All must pass through it, but to the righteous it is like warm milk, to the wicked like molten metal. Ahriman and his hosts are defeated by Ahura and his angels, and perish in the conflagration (cf. SBE xxiii. 306.). Now all come together; relations re-appear to each other; men of ages 40 years and children of 15 years. All are now immortal and clad in spiritual bodies, and awards are apportioned according to merit. Hell becomes pure, and is brought back for the enlargement of the world. The earth is renewed, and paradise is added to heaven (Bund. xxx.; Dink. ix.; Dāšt-i Dinkh, xxiii. 14). The anticipated joys both of heaven and of the renewed world are of a highly spiritual character (Sünderlin, *La Vie future d'après le magiécisme*, Paris, 1901, pp. 128, 269; for the Yima legend, see EEE 1, 286).

9. Muhammad.—Muhammad is based upon Jewish and Christian (and possibly Parsi) eschatology, though there are some important differences.

After death all persons are visited in the grave by two angels, who examine them as to their faith. If the answer is satisfactory, the dead sleep on in peace; in the same manner, they are struck by a hammer and the earth pressed down upon them.

There is a general belief that before the judgment the faithful are again the vehicles of the soul. They are, however, not contained in the earth or the water, but are tormented there or in a foul dungeon (SBE vi. p. i; Sâle, Koran, French translation, 1864; Hughes, *Koran*, 1897). Many wonderful signs precede the Last Day or the Day of Judgment (yaum ad-din; cf. as-Sâa'a, *the Hour*), the time of which is known only to God. Jehovah's right hand will establish righteousness; the last judgment; others; ad-Dajjal, or Antichrist, will appear and be slain by Jesus, who will become a Muhammad; Gog and Magog will be released. Then the angel Isra'il will sample the results which will be followed by frightful convulsions in Nature. At the second blast all creatures will die. At the third the resurrection will take place, and all will rise to give an account of themselves out of the book of their deeds. God is set on His throne with His angels. The recording angels who follow men through life witness against them, and the works of men are weighed in a balance. The judgment lasts 1000 or 50,000 years. All must now cross the bridge as-Sîrât, which passes over hell to Paradise, and is finer than a hair and sharper than the edge of a sword. The righteous cross it easily, but the wicked fall or are thrown from it to hell.

Earth and heaven are changed.

The righteous pass to the seven regions of Paradise, the celestial joys of which, as described in passages of the Qur'an, are of every imaginable type, and are often direct translations of old Persian or Zoroastrian poems (Gaub, *Allah*, Bedüinischen*, 1897, p. 107 f.). They are often spiritualized by Muhammadans, while in the Qur'an itself more spiritual joys are set forth (xii. 26-34). Many also regarded the torments of the seven regions of hell as metaphorical, at least for sinful believers and perhaps for all (Macdonald, *Development of Muslim Theol.*, 1903, p. 130; Buhkari, *Sunh., viii. 110*).

Some hold that heaven and hell did not come into existence until the judgment, and Jahân ibn Sistân taught that both would finally pass away and God would remain alone (Macdonald, 132 f.). Many deny that men are judged by their works, and the corporeal resurrection is also often set aside.

10. Hebrew and later Jewish.—(a) Not till a comparatively late period of Hebrew history is there any trace of the idea of a judgment and a period after death. 1 The soul passes to Sheol, but 2 death is itself a final judgment; for it removes man from the sphere where Jehovah's grace and judgment are exercised. It is taken to hell (cf. Isreal, 1897, p. 64). Retribution is limited to this life, and eschatology is almost invariably connected with the development of history; its subject is the

1 While the general Bab. view of the after-life seems to have been regarded as unconnected with morality, it has been thought that some traces of a retribution-doctrine and of a judgment of the dead may be found in a few of their writings (see Jeremias, *Bab. Conception of Heaven and Hell*, 1902, p. 49).
The Messiah is described as the deliverer, the one who will restore the nation of Israel. This deliverer is seen as more than just a political or military leader. He is a figure who brings about a spiritual and moral transformation that encompasses the entire world. The Messiah is characterized as the one who will judge the nations and establish righteousness. He is often associated with the idea of a future, eternal kingdom where justice and peace will reign.

The text suggests that the Messiah will arise from a line of kings, and he will be revealed as the fulfiller of the hopes and dreams of the people. His appearance will be accompanied by signs and wonders, and he will be recognized by his people as the long-awaited leader. The Messiah is presented as the true king of Israel, who will bring about a new era of prosperity and well-being.

The passage emphasizes themes of redemption, restoration, and renewal. It speaks of the Messiah as the one who will bring about a new creation, where the earth will be transformed and renewed. The Messiah is seen as the one who will reconcile humanity with God, and who will bring about a new covenant that is characterized by grace and mercy.

The Messiah is described as the one who will bring about a new age, where the old ways of sin and disobedience will be replaced by a new order of righteousness and holiness. He is presented as the one who will establish a kingdom that is characterized by peace and harmony. The Messiah is the one who will bring about a new era of enlightenment and wisdom, where people will be free from ignorance and sin.

The text also highlights the importance of faith and trust in the Messiah. It encourages people to have faith in his promises and to trust in his ability to bring about a new era of hope and prosperity. The Messiah is presented as the one who will bring about a new beginning for all who believe in him.

In summary, the Messiah is portrayed as the one who will bring about a new era of hope and renewal. He is seen as the bearer of new life and the fulfillment of all that has been promised in the past. His arrival will bring about a new age of righteousness and peace, where the earth will be transformed and renewed. The Messiah is the one who will bring about a new beginning for all who believe in him.
daring metaphor to describe the restoration of Israel (Hos 6:2; Ezk 37) now, possibly under Persian influences (though it is not absolutely necessary to assert that), became a vital doctrine, stated for the first time in Is 26:8. Thus, after the judgment was accomplished, the righteous remnant, on which the nation was founded, would be destroyed. According to Haggai, it would be a day of destruction for the heathen, followed by the establishment of the Messianic kingdom (2:11-12). In Joel there is the first appearance of an actual scene of judgment, preceded by signs in the heavens. The nations are assembled in the Valley of Jehoshaphat, judged, and destroyed; but Israel, already purified and restored, now enjoys peace and blessing. In Malachi 3:1-2, Jehovah will come, preceded by Elijah (an idea perhaps suggested by the prophecy in 2 Es 4:25), to judge and destroy the wicked, to recognize those who had trusted in Him, and to dwell in Jerusalem. Out of this conception of a judgment still in the future, grew the Old Testament eschatology, which, however, made use of all the elements of the earlier, as detailed above.

Thus in Daniel, following the vision of the four beasts (a picture of Babylonia, Media, Persia, and Greece), there is a judgment scene. The Ancient of Days sits with His hosts, and the books are opened. Dominion is taken from the beasts, and the fourth beast is slain. Now begins the eternal kingdom on earth possessed by the saints (regenerate Israel), typified by ‘a Son of Man’ or a human being, to whom all nations are subject (7:17). But, according to another picture, there is a period of great trouble, in which Michael delivers Israel, or every one whose name is written in the book. There is also a resurrection, of some of the righteous to everlasting life, and of some of the wicked to everlasting shame and contempt (probably in Gehenna)—the latter an entirely new conception (12:2).

Occasional references to the blessed future on earth occur in the Apocalyptic books. God will arise to judge and destroy His enemies (Re 6:16; 20:9). Israel is delivered and the gathering of the dispersed follows (46:50, cf. Bar 24:4). The resurrection of the righteous (2:5), and the kingdom of God (11:15), are expected for ever. In Tobit 13:25 the people are scourged and then brought out of all lands. Jerusalem is restored in beauty, and the nations bring gifts and serve God (13:30-44). The resurrection of the just only is taught in 2 Mac, in a somewhat material fashion (2:11, 14, 23, 26, 32-34). But it is uncertain whether they are raised up to the future kingdom on earth, though 2:24 as well as the date of the book seems to support this view.

(b) A doctrine of future retribution emerged gradually in Hebrew thought. It is adumbrated in Ps 49:16, 73:27, and more clearly in Is 24:11 (4th cent. b.c.), 59:1 (5th cent.), and in Dn 12. Besides the concept of retribution in this life, the wicked are punished in the other world according to 2 Mac 6:74. In Wisdom the wicked are punished after death (4:28) and judged by the righteous dead. These concepts appear more definitely in Apocalyptic literature.

(c) The Day of Jehovah.—In its earliest conception the Day of Jehovah must have meant a visible manifestation of Jehovah in the majesty of terrible majesty, overpowering and conquering hostile evil powers. The whole conception is based on mythical ideas, and to the end the Day was regarded as accompanied with dread and convulsions in nature out of which a new order was evolved. This primitive view of the Day of Jehovah would judge and destroy Israel’s enemies, who now (and also in the Prophets) take the place of the hostile evil powers. It would be a day of battle like the day of the Warsaw, or of the corresponding Arab idiom, see W. R. Smith, Prophets, 308). There was no ethical element here; Israel was to be avenged because of her delinquency towards Jehovah. Jehovah Himself in light (Am 5:19); there would be abundance in the land and festival gladness (5:21). There would be a renewal of the conditions of the Golden Age. To this conception Amos, followed by other prophets, gives a distinct denial. But the Day must also be judged and suffer in the Day of Jehovah, a day of darkness, sorrow, and fear, because she has neglected the ethical side of His religion (2:6). The righteous nations hostile to Israel, and regarded often as the instruments of Israel’s punishment, would also suffer, but mainly Israel (39). Thus Jehovah’s character as a righteous God would be vindicated. If the passages in Amos and Hosea are brought together upon these judgments be later interpolations, then they, like Micah, regard the Day as one issuing in nothing but doom. But this idea soon gave place to a further and more spiritual conception of the righteous remnant, and in some cases the heathen nations also, would find the Day ultimately issue in blessing.

Here the prophets in part take over the popular view of the Golden Age issuing out of the destruction of Jerusalem in the convulsions of Nature, but at the same time they spiritualize it, and limit this bliss to those who survive because of their righteousness. The restoration is to be not on a national basis, but as individuals (2:12).

This is more particularly seen in Nahum and Habakkuk, in whom a conception of the Day is found which somewhat resembles the popular one in form, but differs in essence. Jehujon is now regarded as already righteous (Nah 1:14, Hab 2), and the Day of Jehovah is His terribleness against her wicked foes. Thus His righteousness and that of Judah are vindicated. In Jeremiah and Ezekiel the relation of the individual to Jehovah is emphasized (Jer 6:21, 31, 3, 43), Ezek 14:12-15:1. Hence with them the Day of Jehovah was less a manifestation of His judgment on the nation than on the individuals composing it, and it is the restored in the restored individual (Jer 31:33, 25:21, 12:4, Ezek 17:22-24, 34:10, 14:21, 34:28). The nations as such share in the judgment (Jer 25:32, 46:17). The relation of the nations who survive the judgment to the blissful Kingdom is differently viewed in these Prophets, and their differing views were reproduced in later works.

According to Jeremiah, the nations participate in the Kingdom (31:4-8, 12, 15) — a view which is followed by other prophets (Mic 4:1-5, Zec 2:10, for some of whom the idea of the Day of Jehovah hardly exists, its place being taken by that of Israel as the means of the world’s restoration (cf. Is 45:16f., 24:2 [post-exilic] cf. Ps 22:28f.), 59:27, 66:24). In Malachi, where the same hope is found, there is a Day of Jehovah. According to Ezekiel, while the righteous remnant will be restored, the nations will be forever destroyed in the Day of Jehovah’s vengeance (21:21, 25:36; cf. 21:29). This view has already been found in Nahum and Habakkuk. It is found also in other prophets, who look forward after the Return to a destruction of the nations (Is 24, Hag 2:6-23, Zec 13:9), preparatory to the establishment of the new era. Or the nations or some of them as survive the Day will become servants of Israel (Zec 2:11-14, 21:8), have to play an important part in the Kingdom of Jehovah and His people (see Isaiah, Est 2:24, Jer 31:30-31, 32:26, 34:5, 46:17). It is found in other prophets, who look forward after the Return to a destruction of the nations (Is 24, Hag 2:6-23, Zec 13:9), preparatory to the establishment of the new era. Or the nations or some of them as survive the Day will become servants of Israel (Zec 2:11-14, 21:8), have to play an important part in the Kingdom of Jehovah and His people.

The idea of the Day as an actual day or as a scene or assozio is found in Jl 3:16, where the heathen are assembled in the Valley of Jehoshaphat, whc. in 1 Cor 15:20-22, 1 Thess 4:16, 1 Cor 15:20-22, 1 Thess 4:16, 1 Cor 15:20-22; Gesammel, Der Ursprung der israelitischen jahwek, Gottingen, 1905. 1
Jehovah sits to judge them, after the restoration of His people. They have been humble, and who are now penitent. The nations are destroyed. A world-judgment is already suggested in Zeph 1:14-15, Is 34, Jer 20:2, Hag 2:11, and it reappears in Mal 4:1. Various names for the Day of Jehovah in the OT are 'the Day' (Ezk 20:23), 'that Day' (Is 30:21), 'the time or that time' (Ezk 22:13, 27:19), 'the Great Day' (Zeph 1:17, Zech 14:4), 'the Day of His wrath' (Zeph 1:18, cf. Re 6:17; cf. 'the Great Day of His wrath' (Rev 6:17). In Apocalyptic and Apocalyptic literature the phrase is used in referring to a period before or after the Messianic Kingdom, varies, but it covers ideas similar to those of the Prophets—the Day of Judgment (Enoch, S. of En 30:1; 4 Ezr 7:9, Apoc. bar. 638; Test. xvi. Patr. [Levi 29], 16th, Job 32:23, the 'Day of the Great Judgment' (Job 23:1, S. of En 30:9). Other titles are 'the Day of the Great Consummation,' 'the Day of tribulation, distress, or slaughter,' 'that great Day' (see Charles, note to En 42, p. 252 i. 'the Day of the Great Condemnation' (Job 30:31, 'the Day of the Lord's coming' (Mal. 3:20), 'the Day of the Wrath of Judgment' (Job 24:8), 'the Day of turbulences and execration and indignation' (Job 30:30), 'the Day of the Mighty One' (Apoc. bar. 5:39), 'the Consummation of the times' or 'of the ages and the beginning of the times' (Apoc. bar. 139:65, cf. 289, also 292). 'My redemption—Day of Judgment' has drawn sighs, cf. Mk 10:39, Lk 18:31, 1 P 4:17, 'the Visitation' (Ass. Mot. 190), 'the Day of the Gospel' (Ass. 190). (2) The righteous judgment of God' (Test. xvi. Patr. [Levi 29]). Sometimes it is occasionally Messianic (En. 62:2, 260:13 acts as judge in N. T.). In the OT the title 'Day of Jehovah' passes over to various phrases in which is joined the Judgment, and it appears in the forms 'the Day of Jehovah', 'the Day of the Lord', 'the Day of the Lord's judgment', 'the Day of Jehovah's Christ', 'the Day of Christ' or 'of our Lord Jesus Christ' (Zech 14:4, 'the Day of the Lord of hosts' (Mal. 3:2); and 33:9, 'the Day of our Lord Jesus Christ' (Zech 14:4)). (2) The Day of Jehovah' (Mk 10:39, 2 P 3:10), 'the Day of the Lord' (5 Co 3:17, 2 Th 1:14, 2 Th 1:19, 'the Day of Judgment' (Mt 25:31, 2 P 3:7, 1 Jn 4:17), 'the Day of judgement' (Heb 9:28), 'the Day of our Lord' (2 Th 1:10). Cf. Lk 17:24 'so shall the Son of Man be in his Day,' and St. Paul's pregnant phrase, 'the Day of Jehovah, and revelation of the righteousness of God' (Ro 2:6). (d) Apocalyptic eschatology.—In approaching the period of Apocalyptic literature, it must be borne in mind that its preoccupation with the kingdom of God is an in and nourished by OT prophecy (where also Apocalyptic ideas are not unknown, e.g. Ezk 37 II, Zec 1 II.; cf. also Dn.), its anticipations are of a much more definite character, and announce coming events in a more formal manner. It also occupied a different standpoint from that of the orthodox Pharisaic schools. This literature was of a popular character, and did much to quicken that belief in the Messiah and the coming of the Kingdom, as well as that individual hope of the future, which were so characteristic of the people's thoughts in Christ's time. Moreover, it can hardly be doubted that he at least of those who were familiar, if not with that literature, at least with the ideas to which it had given birth. This raises a strong presumption that the eschatology which He taught or which was attributed to Him followed the lines of current ideas, but, as will be seen, with important differences. (l) In Apocalyptic writings the coming of Messiah, or the advent of the new order, often inaugurated by God Himself, or the final judg- ment, is preceded by terrors and sorrows (the 'Messianic woes') and by frightful convulsions in Nature. God or Messiah destroys the enemies of Israel, and spiritual foes—Babylon, demons, evil angels—and brings in His kingdom, with all these horrors, the true Israel is concealed (cf. In 289, Enoch 63:9, Ass. Mot. 10). Then follows the eternal or temporal Kingdom on earth, the somewhat 'seemingly' the kingdom which is—greatfulness, eating and drinking, begetting numerous children—together with more spiritual ideas—the absence of sin, the nearness of God to His people—reflects the thought of the Prophets. While in so many writings Messianic life is not the place (certain sections of Enoch and Apoc. Bar., Ass. Mot., Secrets of Enoch), in others he is introduced mechanically, but in others again he has a most important place, e.g. Ezr 4 Ezra, Ps. Sol., Ps. Jer., Ps. CD, 4 Ezra sections of Apoc. Bar., and, as in Ez 33 II., he acts as Judge. The destruction of Israel's enemies easily passes over into the heavenly. A Last Judgment of Israel and the actions already adumbrated in the Prophets; and this, in necessary association with ideas of Resurrection, is a dominating conception of Jewish eschatology. Prominent, too, in some writings is the thought of future and final bliss or torment in the Other-world. The Apocalyptic writings show three well-defined notions of the future: (1) continuing the prophetic conception, there is a new establishment of a blissful Kingdom on earth or on a renewed earth (En. 1:36, 37—70 [new heaven and earth], 83:90; Sib. Or. iii. 194 f.; Test. xvi. Patr.); (2) the Kingdom is temporary, and at its end the judgment begins to follow the overthrow of the eternal world (En. 91 f., Apoc. Bar. [various sections], Secrets of Enoch, 4 Ezr, and possibly Ps. Sol., Job., Ass. Mot.); (3) no Kingdom on earth, but an immanent future bliss or Other-world. (2) The earthly earthly Kingdom.—In Enoch 1:30 (c. 170 e.c. [so Charles, ed. Book of Enoch, 1889, p. 28]) there is a preliminary judgment. Azazel and the angels who learnt after women are set in the place of darkness until the time of the Resurrection. The righteous are confined in a waste place over an abyss of fire. Sinners have a place in the Sheol till the resurrection. The resurrection and judgment are accompanied by shaking of the mountains and rending of the earth. God appears with ten thousands of His holy ones to judge the earth in the presence of the King (see 1 S). Azazel and the angels are cast into an abyss of fire, along with all who are seen in the wicked in Sheol (100:13, 324:27). The righteous are raised and, with the righteous who are alive, dwell in peace on earth, which will be full of joy and comfort and peace. They shall have wine in abundance. The righteous will live till they beget a thousand children, and will never sorrow, pain, nor trouble. Labour will be a blessing. Righteousness and peace will be established, and the earth will be cleansed. The righteous eat of the Tree of Life, which gives them eternal life. They enjoy the presence of God, who will sit on a throne in a high mountain, and they never sin again. The remaining Gentiles become righteous and worship God. A not dissimilar picture is found in Enoch 83:90, but here a human Messiah, symbolized by a white bull (607), is described vaguely as dwelling in the Kingdom, though not introducing it. Still more important, the idea of a new Jerusalem—of the purified earthly Jerusalem, but an entirely new city set up by God—is found here; see 14. The Judgment is depicted under the figure of God sitting on a throne. Sealed books are opened and set before Him. The stars and angels are judged and condemned to an abyss of fire, along with apostate Jews (605). The risen righteous are transformed into the likeness of Messiah and live eternally. In the Testament of the Twelve Patriarchs (109-105 e.c.) the dispersed of Israel, or Israel after repentance, are restored. God appears (54, 6, 58) on earth among the earth and destroys those who are evil. But in other parts a sinless Messiah—king, prophet, and priest—appears and wars with the enemies of Israel or with Beliar, from whom he saves the people of Israel (cf. Enoch 91, 18), or casts him into the fire (Jud. 291). Sin now comes to an end (Levi 15). The resurrection of the dead is described as follows: 'Abraham, Isaac, Jacob, the twelve patriarchs, and all men (Ben. 190), some to glory, some to shame, follows. All are judged, and the judgment is accompanied by conversions of Nature (Levi 41). There are snow, fire, and famine, and spiritual and material reward reserved in the heavens, as well as armies for vengeance on the spirits of deceit and Beliar (Levi 2). The Gentiles share in the Messianic Kingdom which is on this earth. The saints are said to rest in Eden and the New Jerusalem (Dan 21:11), or in Paradise which Messiah opens (Levi 41). In Ez. 37:20 (1st cent. e.c., cf. Charles, p. 292) there is a preliminary judgment on the dead (411). The righteous are oppressed and cry for help. The supernatural and pre-existent Son of Man appears with the Head of Days. He sits on the throne of his glory, set there by the Lord of Spirits, that he may judge (457 465 475, cf. 476) for the earth and destroy the wicked, who are angels, good and evil, are judged before him, as well as the kings of the earth and all who dwell in it (51, 52, 51:4, cf. 479). The wicked are consigned to Gehenna or driven off the face of the earth (353 472 474 53:5). God transforms heaven and earth as a place for the righteous. The dead are wakened (categorically mentioned as an abode for the righteous). The Kingdom is here not conceived soteriologically, though the righteous 'eat with this Son of Man' (289). The Elect One dwells with the righteous, who are clothed with garments of His glory (605), and live for ever. They find righteousness with the Lord of Spirits (605). In the third book of the Sibyline Oracle God sends a king who brings all war to an end. Now the nations assemble about Jerusalem, but are destroyed. Israel dwells safely under God's protection. Earth is destroyed; stars are arranged in the sky, wine, and oil. There is abundance of trees, cattle, and sheep. There is no more drought or famine. It is 119:9 here paraphrased. The eternal kingdom, with Jerusalem as its centre, extends over...
The whole power, for the heathen now worship God and live at peace (vv. 308-9). The eternal Messianic Kingdom is referred to in this passage.

(2) The temporary earthly Kingdom. — (a) Meanwhile a temporal Messianic Kingdom had been established in a measure. The Kingdom had its incorporated elements—sacred and earthly, spiritual and heavenly; and the separation of the same and its continuity, so far as the Jew was concerned, by the partition of the Heiligenlithau—its dominion and its eschatology—the immediate entrance of souls into their state of bliss begins at the resurrection of the dead. The Messianic Kingdom, which ultimately issued in that of a Millennium, was a compromise between the old hope of the prophets, which was based on the actual and permanent establishment of a transcendental hope of Israel (Gunkel, in Kantzsch, Die Apok. und Pseudep., der AT, Tüb. 1906, ii. 37). The first appearance of the Kingdom is detailed in the visions of Ezekiel (xl-xxxii, xlv, cf. 134-34 R. C. [see Charles, p. 29]). Here, under the influence of the 70 years of Jer. 25, the doctrine of the world-weeks is found. The first 7 of these are increasingly wicked; at the end of the 7th the 'elect of righteousness' receive revelations concerning the present situation (Ezek. 38). Now begins the Kingdom, and in the 8th week sinners are delivered into the hands of the righteous for destruction; the latter acquire houses, and the temple is built in glory. The righteous Kingdom is revealed to the whole in the 7th week. Sin vanishes from the earth, which is, however, written down for destruction. At the end of the 60th week the great Judgment occurs. The earth is destroyed; the fire and the sea enter, and the heaven appears (Daniel 0-15). The righteous dead rise to it from their Intermediate abode (2Thess. 3. 13; resurrection of the spirit); they live in good will and righteousness, and walk in eternal light. At this book the wicked at death are cast into sheol (99), and here their misery is eternally to continue. In some other periods of this world it is not clear whether the Kingdom is temporal or not. Thus in the Book of Jubilees (c. 1) and the various usages of the Messianic, there is a return from righteousness and a Messianic Kingdom, with God dwelling in Zion, the earth is changed, and the holiness of God is renewed. The earth is gradually renewed as a conditional result of man's being transformed spiritually (47). There will be no Satan or any evil death in the Kingdom (iv. 29, s). The verse which says that God will 'descend and dwell with them through- out eternity' (28) stands in relation to the eternity of the Kingdom (28, 32); but, on the other hand, it seems to terminate with the great Judgment (see Esh. IV. 1, see Charles, 1905, p. 150, note 282, in which the text of the Books of Jubilees, as well as the whole of the periodical system, is followed). In the latter, the wicked are all sinners to be judged (11. 23, 24, 28). The resurrection of the just is permanent (12).

The same uncertainty characterizes the Psalms of Solomon (c. 7o-40 R. C.), with their vivid presentation of the Messianic hope. In the personal hope, that of a Messianic Messiah, Xæsc, who will appear and drive out from Israel the heathen and sinners, but with spiritual weapons, and gather together the holy people, and rule them in holiness. The earth will be divided among them. The heathen will serve him as vassals, and Jerusalem, purified and made holy, will be the centre of his holy and free rule (Psa. 72). There is to be a final day of judgment (154-15); but, as this is never said to precede the Messianic Kingdom, and as the duration of the latter is probably 'contemporary with that of its ruler' (Charles, Crit. Hist. of Doct. of Ful. Life, 1880, p. 223), we may refer to the earlier occurrences of similar ideas in the righteous, who rise to life eternal (c. 129) and inherit life in the Kingdom of God. They are those that have told of Hades (the abode of sinners, 159), darkness, and destruction for ever (131).

A clearer view of the temporal Kingdom is to be found in some of the constitutions of the Apocatastasis of Talmud (a). 30-50. It will be preceded by tribulations and convulsions of Nature which do not affect Palestine (P. 229). Messiah is then revealed (229-237). In two of these sections he says (1) (a) the leader of the hostile fourth couple (iv. 226-227) is a kind of Antiichrist, and (b) the hostile nations which have been divided up the world, and are, amid convulsions of Nature, interfuse on behalf of Israel. Satan will now be no more. Then thou, O Israel, will be happy (155). Finally, Israel is exalted to the firmament, and thence looks down upon its enemies in Gehenna (or on earth) (204). There is no kingdom in this book.

Clearer view of the temporal Kingdom is to be found in some of the sections of the Apocalypse of Baruch (a). 50-70. It will be preceded by tribulations and convulsions of Nature which affect Palestine (22-23). Messiah is then revealed (237-239). In two of the sections he says (2) the leader of the hostile fourth couple (iv. 226-227) is a kind of Messiah, and (b) the hostile nations which have been divided up the world, and are, amid convulsions of Nature, interfuse on behalf of Israel. Satan will now be no more. Then thou, O Israel, will be happy (155). Finally, Israel is exalted to the firmament, and thence looks down upon its enemies in Gehenna (or on earth) (204). There is no kingdom in this book.

° The Judgement is a 'day of mercy' for the righteous, but so also is the day when Messiah appears (156). Does this mean that the Judgement takes place on that 'day' (cf. 159)? In Ezek. 407 Leviathan and Behemoth are said to be 'parted.' In the Talmud (Bab. bethrera, 74a) Leviathan is cast on Levithen on the 8th week. In the Targum of pseudepigraphon-Jonah on 1134, Jonah will come on the ox prepared for them from the beginning (see Gfröor, q. c., 1544. 3). It is also said that Leviathan is divided up, and Behemoth is also divided up for the righteous (cf. 1 Esh, 447). It is also said that Leviathan is divided up, and Behemoth is also divided up for the righteous (cf. 1 Esh, 447).

It is also said that Leviathan is divided up, and Behemoth is also divided up for the righteous (cf. 1 Esh, 447).

(ii) In later prophetic books the Resurrection includes the righteous and also wicked Israelites. In Apocalyptic books it generally excludes the wicked (cf. 4 Apoc. 24). The resurrection of the wicked (v. 91) is mentioned (v. 909-91 f. resurrection of the spirit). Ps. 34. 3rd (bodily or spiritual). But it sometimes includes the wicked Israelites or some of them, though their resurrection may not be bodily. (v. 91-2). For instance, the righteous (v. 91) are described as in a seminal body (v. 91-2). Again, in others, perhaps as a result of Christian influences, there is taught a resurrection of all, both Jews and Gentiles, righteous and wicked, in the same body (cf. 4 Apoc. 50, 1, 5; 50, 1, 4).
ESCHATOLOGY

381

The destruction or resurrection of the righteous only, though occasionally a resurrection of the righteous Gentiles, or even of all Gentiles, is taught (Größer, ii. 276 f.; Volz, 247 f.; Eisenmenger, Entdecktes Judenthum, Königberg, 1790, p. 368 f.). In Jud. 23, spirits of the righteous are glorified; cf. Ass. Mos., and the Alexandrian Jewish school—Sirach, Philo, also the Essenes and Sadducees. In Secrets of Enoch 22nd, righteous men are 'barnes' (Dn 142, cf. the Pharisian belief in Jos. BBel. viii. 13 [good souls receive 'other bodies']; see Schwally, Leben nach dem Tode, Glessen, 1892, p. 171 f.).

(1) Dn 12 is the first place in the OT where the Final Judgment includes the dead. A not dissimilar idea of a final judgment for certain of the dead, already subjected to a preliminary judgment, appears in Is 24-26. In these Apocalyptic books, where punishments are allotted to evil angels or the dead before the Final Judgment, a preliminary judgment is also implied or stated. Such a judgment is often inflicted on the living by Messiah, or the saints, at the beginning of the temporal Kingdom. It is the result of the Final Judgment, which allots the last and worst condition of the wicked. Where the Messianic Kingdom is eternal, the Final Judgment usually precedes it. But, where it is temporal, it occurs at its close.

(iii) The condition of the dead before death and the Resurrection or Final Judgment may be summarized as follows. Sheol is an intermediate state in which the righteous are separated from the wicked. From it the righteous rise to the eternal Messianic Kingdom (En. 1-36; cf. 2 Mac). Occasionally it becomes also the final state of punishment for the wicked or for some of them, though Gehenna is the more usual term for this state (En. 229-991, Ps. Sol. 14b 15b, Ass. Mos. 10b, Jud. 7a 23b). Talmud; cf. also the fiery abyss in En. 182b (wicked angels). A similar conception of Sheol as an intermediate abode is found in En. 91a, 4 Ezr 4a, Apoc. Bar. 11b 23b 52b, Josephus; but here the righteous rise to a Kingdom in heaven, or to a Messianic Kingdom in a new heaven and earth (En. 27f.), although, as in 4 Ezr, there is a first resurrection to a temporal Kingdom. Where Sheol is regarded as a place of torment for the wicked at death, the righteous go to it as a preliminary or intermediate abode, or else to an intermediate Paradise (Jud. 7b, En. 61b, Secrets of En. 32). The older conception of Sheol as a general place of the dead is still found sporadically, massalibrated with the newer ideas (see Volz, Jud. Eschat. 288). The final reward of the righteous is generally 'everlasting life' (Dn 12, En. 49b, Secr. of En. 65b; cf. Mk 806 etc.—usually in heaven, or in the new heaven and earth. Most of the wicked is 'everlasting destruction' (Ps. Sol. 15c). They remain in Sheol or suffer torments in Gehenna or the 'abyss of fire.' Annihilation by fire which goes forth from God is referred to in Ass. 4b. 4b. Torments, fire, and darkness are, as a rule, mentioned once. The ice, snow, as well as spirits of retribution reserved for the Day of Judgment, occur in Test. xii. Patr. (Levi 3). In later Judaism, Gehenna is the purgatory for unrighteous Jews, but Gentiles are eternally punished in it.

(iv) The place of the Gentiles in the earthly Messianic Kingdom varies in Apocalyptic books. There is a kind of 'paradise' to be given to the Gentiles (Sib. Or. iii. 710 ff.). Those who have not been enemies of Israel are spared, and are subject to Messiah or Israel (En. 23, Apoc. Bar. 72c, Ps. Sol. 17c; cf. Rev 21b 22b), or those who repent and accept the light of Messiah are gathered in with Israel and enlightened (En. 48b 50b, Test. xii. Patr. [Levi 10, Naph. 8b]). But in other cases (mainly 1st cent. EC) the Gentiles are doomed to destruction and punishment (En. 37f. Ass. Mos. 10, 4 Ez 13c, and also in later Judaism). In Jud. 23 (cf. 50b) they are driven out of Palestine (cf. Sib. Or. v. 28b. 1st cent. of God's glory) ('of the Pharisaic belief in Jos. BBat. viii. 13 [good souls receive 'other bodies']'; see Schwally, Leben nach dem Tode, Glessen, 1892, p. 171 f.).

On this subject, see Böckenh, Die Vermittlungskonzeptionen der jüd.-christlichen Geschichte im pers. Eschatologie, Göttingen, 1902; Stare, Uber den Einfluß des Paraisos auf das Judentum, Harris, 1903; Opalins, Grips of the Past, 1905; Mills, Avesta Eschatology, Chicago, 1908; Soderblom, op. cit. 201 f.; Bouquet, Rel. des Judaisants, 475 sqq.

11. Eschatology in the Gospels.—(a) The interpretations given by our Lord as to the future eschatological appearances have been many. It has been taken with absolute literalness; it has been spiritualized; it has been regarded as subject to interpolation, greater or less; or its originality is admitted, but its ex-
pected fulfilment is regarded as a mistake and an illusion which, however, does not disannul Christ's real greatness. In reviewing our Lord's teaching, we must keep before us certain important probabilities: (1) that He used the current Apocalyptic language mainly for a popular truth; (2) that Apocalyptic language which He did not use has been attributed to Him; and (3) that His sayings were misunderstood and a wrong colouring given to them by His disciples. It may be, therefore, that the importance: 'Jesus above the heads of His reports.'

Christ's teaching points to two separate ways of regarding the Kingdom of God. It is a present spiritual reality (Mt 11:22, 13:17, Lk 17:22, 28). But it has also a future consummation: the 'glory of His Kingdom,' the ταξιδεύεται. The one condition is a preliminary to the other. The present Kingdom revealed in righteousness is to spread until it is universal.1 St. Paul's conception of the Kingdom is similar. It is a present and purely spiritual state (Ro 14, Col 1), but our full inheritance of it is in the future (1 Co 6:15).2 But in some statements of Christ the future Kingdom is introduced suddenly and is catastrophic. How are these different aspects—development and catastrophe—to be reconciled? The New Testament teaching is that Christ thought that the Kingdom would be inaugurated immediately after a short period of Messianic woe; He Himself being revealed as Son of Man, or Messiah, after a supernatural removal and transformation, but that, having soon to be impossible, He began to speak of a future Kingdom and brought on His death in order that the catastrophic coming of the Kingdom might at once follow, cannot be proved.

Messianic woe is no Jewish precedent for such a conception of Messiah. Nor can it be certain that Christ looked forward to an immediate coming of the (future) Kingdom.

In Mt 10:23 a coming of the Son of Man before the disciples go over all the cities of Israel is foretold. This completes a section (vv.17-23) which has no parallel in the Mk, (66), and Lk (66), accounts of the mission of the Twelve, this ending with the command to make off the dust from their feet (cf. the parallel mission of the Seventy, Lk 10:14). This discourse in Mk, and Lk (- Mt 10:52) is thus complete in itself. This is seen in the fact that the additional section in Mt (v.17) has parallels in the Apocalyptic discourse in Mt 24:24-31 Lk 17:21. These have nothing to do with the mission of the Twelve, and is perhaps a mistaken form of the formula found in Mt 24:14, Mk 13:19, (though it is found in Lk 17:21, where the Kingdom comes not with observation, etc. (17:22)). In Mt, they break the continuity of the discourse, and the Kingdom will take place after the return of the Twelve from their hasty journey. Further, the sufferings prophesied (v.17) are not those which will attend their return, but refer to a state of things after Christ's death and before the unknown future Parousia (cf. Jn 16:33). They are the 'Messianic woes' of current eschatology.

The two methods of regarding the Kingdom, present and future, correspond to the Jewish conception of a temporary, followed by an eternal Kingdom (cf.7), but with important differences. Christ has come and established a Kingdom of God on earth—not, however, a sensuous Kingdom, but a reign of righteousness; and not a realm which has actually produced, but the result of the gradual yielding of human wills (cf. 2 Co 5). But the consummation of the Kingdom was not on earth but in heaven. To this our Lord himself pointed, and taught that the consummation would have its catastrophic beginning, here following Apocalyptic.

1 Cf. Harnack, Sayings of Jesus, 1906, p. 222: "If any one finds it difficult to accept the antiquity 'the Kingdom will be finished in future and yet present,' argument with him is useless." See also Sunday, J. R. [1911] (1). 2 See also Nollen, Die Predigt Jesu vom Heilige Gottes, Göttingen, 1910; Schwalzer, Von Reinarus zu Werthe, Tübingen, 1903. 3 King, The Quest of the Historical Jesus (1910); Tyrell, Christianity at the Cross Roads, 1909. 4.3. tion of the Temple, which is near at hand. Whether they mean Israel or the answer is a different question, and the probability is that they are not (cf. v. 14 ‘readeth, not ‘heareth,’ and the completely different form in Lk 21:20 ‘compassed with armies’).

Thus the conjecture of E.W. is too strong—

\[ \text{v. 14-16, 19-20 } \text{Appearance of false Christs.} \]

\[ \text{v. 11-13 Persecution of disciples.} \]

\[ \text{v. 2-3 Testimony of false Christs and prophets.} \]

\[ \text{v. 28-29 Near approach of these events.} \]

Probably this discourse has been coloured by the eschatological preoccupations of the interpreter, for it is unlikely that our Lord would give details of the event. Lk 18:28-30 would then also be coloured or interpolated.

This leaves the purely eschatological passage—

\[ \text{v. 26-27 The coming of the Son of Man.} \]

\[ \text{v. 37-38 The unknown time of the coming. Warnings to watch.} \]

The inconsistency of an unknown coming being heralded by signs is inevitable in Apocalyptic, and occurs in 1 and 2 Thess. 1 and 2, also 1 and 2 Pet., the Thessalonians, Gal 4:4, etc.; Phil 3:20-21. Thus the coming of our Lord is not a precise event in time; it is a general idea, and is shaped by the context. It gives a clear picture in prophetical and apocalyptic style of the Parousia at an unknown and probably distant time. It that was spoken as it stands need not be asserted, but it is unnecessary to support the claim that it does in any way make predictions in the context of the Apocalypse. Christ’s references elsewhere to the Parousia are less detailed, but their language corresponds.

The sudden but unknown Parousia of the Son of Man is often mentioned—Mt 24:4–5; Lk 17:26; cf. Mt 24:7-8. The Son of Man is to come in the glory of His Father and in His own honor, and is to come in power and in the splendor of His glory, to reward every man according to his works, or to be ashamed of these ashamed (Lk 17:28). The Parousia is clearly regarded as Mt 25:21–27, Mk 14:25. The Son of Man is to send His angels to gather out of the Kingdom all that offend, but the righteous will shine as the sun (Mt 13:43). The judgment is further described in the discourse of the Sheep and the Goats (Mt 25:31–46). For other references to the Day of Judgment, see Mt 19:35; Lk 11:49; Lk 17:22; Lk 18:7; Lk 17:24; Lk 17:25.

To these passages there are parallels in Dn 7:12 ‘come with the clouds of heaven,’ and in Ezek, where the Son of Man is described as sitting on the throne of His glory. (Dn 4:16 692 607). Angels of punishment take the wicked and execute judgment upon them (Dn 3:13). Thus, as well as in the passage in Mk 13, echo the language of Apocalyptic.

The passage ‘Then in the regeneration,’ etc. (Mt 13:29), does not occur in the parallel passage Mk 10:25–11:2 Present. But it occurs very frequently in the NT where it is obviously out of place with what precedes. It may be an eschatological addition suggested by such an incident as Mt 10:26-27; cf. Mk 8:27. It is not a natural result of such an incident; the Kingdom of Heaven (Mt 25:31–46), but it is found in other Apocalyptic passages as Mt 25:31-30, Lk 17:22, Rev 11:15. It is, however, a common of honour’; Test. avi Patr. Jud. 25, at the resurrection Judah and his brethren will be chief of the twelve tribes; cf. Ben, 107; cf. also Rev 20:6. The idea of judgment by the righteous one is already found in Dn 4, En. 192 976 902 12; Wis 3, cf. 1 Co 5:5.

Christ spoke so often of the judgment on Jerusalem that we can hardly doubt that in His mind it was a Divine judgment, and, as such, a coming of the Son of Man to the city which had rejected Him. Much of the detail is obviously interpolated, and it was not the Final Judgment (as Wente [Teaching of Jesus, 1892, li. 364 f.] insists), though the horror excited by the fall of Jerusalem caused an anticipatory application to that Synagogue tradition. Possibly, therefore, Mt 10:20 may have been spoken with reference to this event as a ‘coming.’ (One may here compare the punishments on the unfathful churches in Rev 21:18, 19, where the spirit is compared with the Parousia for the Church.

After this ‘coming,’ Christianity would make itself free of Judaism and enter on that long period of growth which is pointed to in Mt 13:24; 26:1; Lk 21:37; Mk 13:9, 26, etc. Thus, in a sense, the present Kingdom on earth has its catastrophic coming or point of development, analogous to the catastrophic coming of the future heavenly Kingdom.

The emphasis laid on the unknown time of the coming, as well as the mingling of two events in Mk 13, helps to elucidate those passages which look forward to it within this generation. In Mk 8:39 (Lk 9:57, Lk 9:27) ‘some shall not taste of death till they have seen the Kingdom of God come with power’ (L. k. ‘see the kingdom of God’; Mt. ‘see the son of Man coming in his kingdom’) immediately follows on a reference to the Parousia and Judgment. The latter, said elsewhere to occur at an unknown time, is here combined with an event said to be near at hand. Two different things are spoken of, or were spoken of, at different times and combined by one who believed in the imminent catastrophic coming and establishment of the Kingdom. It is impossible to suppose (as Dobschütz does, Eschat. of the Gospels, 1910, p. 110) that there is here no real contradiction, because, in putting the thought of the end of this generation, Christ gives no real date. It should be noted, however, that Mt. is more eschatological than Mk., who, again, is more similar to Luke. This is an example of the way in which to a non-catastrophic apocalyptic saying may be added from an eye-witness account of the Parousia. Christ’s references elsewhere to the Parousia are less detailed, but their language corresponds.

That this is the case may be seen from the fact that the Parousia is invariably spoken of as a coming of the Son of Man with His angels, followed by a judgment (Mt 28, Mt 13:30, 10:26; Lk 21:25). This differentiates it from the simple seeing the Kingdom, or coming of the Kingdom with power (Mt 6:10, Mt 7:21, Lk 1:77), and suggests that these phrases do not refer to the Parousia properly so called. Similarly, the Kingdom is already come in the presence of Christ (Lk 18:35), and invisible presence might also be felt in all future spiritual, moral, or national crises.

That the future unknown coming may also be a distant coming Lk 17:26 from the form of the saying, Mk 13:30 ‘at even, or at midnight, or at cock-crowing, or in the morning.’ Similarly in Lk 18th, to those who thought the coming of the Kingdom of God imminent Christ spoke the parable of the Talents, with the phrase ‘Occupy till I come.’ Cf. the parallel passage Mt 25:3 after a long time the lord of those servants cometh. Again, the words to the high priest, ινά αποκαθιστήρι τα εὐσεβεία τα (Mt 20:26), or simply εὐσεβεία τα (Mk 14:6), do not necessarily denote that he would see the coming of the Son of Man in his lifetime, but may mean after death, at the resurrection, when the just as well as the just would rise, according to a well-known opinion of Jewish Apocalyptic. Cf. Ez. 51, where at the coming of the Son of Man all Israel rises. It should be noted also that the parallel Lk 22:1, 5 says nothing of a coming of the Son of Man (cf. Ac 7:4). Thus the exhortation to watch for this continuance of the eschatological expectation is not to imply that it would be in the hearers’ day, since Christ Himself did not know when it would be. It might be then, therefore they should be watchful. But the words are spoken also to future generations of disciples.

\[ \text{1 In one of the sections of the Apocalypse, the fall of Jerusalem is antecedent and preparatory for the Judgment (39).} \]

\[ \text{2 Cf. Mt 24:8, 10; Lk 8:21, 22.} \]
In its present form the Kingdom fulfills the anticipations of the past, but these are generally spiritualized by Christ (cf. Dobschütz, 131 f.). Why, then, does He use the current ideas and language regarding the future catastrophic Parousia, without also clearly spiritualizing it? If He is correctly reported, His purpose may have been to show that the Son of Man would be the prince of this future time, and to point to His own future justification as well as to the necessity of an ethical division before the establishment of the heavenly Kingdom—a division begun and ended by Paul (Rom. 13). In His day's anticipated literal fulfillment of these sayings in their own time, they also caught the spiritual sense, and their eschatological hopes did not interfere with their Christian life and conduct. In their discourses in Acts, though judgment is spoken of, the main stress is not eschatological. Indeed, though Christ used the language of His time as well as of past time, He did not necessarily mean that He would actually come on clouds, or that a great visible σωςίσσω would take place. His hearers had no 'cestial language,' and perhaps to Him there was open only the inadequate language of His time—metaphor and pictorial imagery. It was the eschatology of His thought, and the stress of the spiritual sense it expresses, that makes the difference. Moreover, even the thoughts which lay in the depths of His personality, and which, when combined into living faith, were to express themselves as they rose to the surface from time to time, through the medium of His thoughts, while yet they always indicated their presence, or from time to time fixed aside the restraints of His time. Hence, this reason that His eschatological conceptions bear the appearance of an immanent as well as of a catastrophic coming. Intense convictions loom large on the mental horizon and assume a nearness of fulfillment which is illusory. In times of intense thought we 'can crowd eternity into an hour.' This was true of many prophetic utterances, and it was much more true of Apocalyptic convictions, which frequently speak of the nearness of the last things, as if they could not be otherwise conceived of (cf. En. 51, Apoc. Bar. 204 237 822). Yet combined with this is an uncertainty as to the time (Apoc. Bar. 24 4 4 Ezr 8, Sib. Or. III. 55). Still, what is emphatic is less the constant expectation than the absolute certainty of the reality of the things of the end.

For these reasons Christ's deeper knowledge and conviction of His position as Judge of men's thoughts and deeds took shape in His surface thoughts, mainly, though not always (see below), in intense eschatological conceptions, which (if the nearness of the Parousia in His teaching is insisted on) then assumed the form of an immanent and catastrophic Parousia. We must, therefore, search for the rich meaning of which Christ's eschatology is full, and which its association with the past already connotes.

3. Thus it is not necessary to assume that Christ taught absolutely an immanent Parousia. This overcomes the theory that such a prophecy was falsified, as well as the necessity of resorting to sophistical methods of explaining away the falsification. Christ's moral acceptance of the Parousia teaching robs it of much of its meaning. Is there not rather here an impulse to moral conduct, because Christ comes as Judge not finally but already? Or is it not really the judgment and not the Parousia which suggests what is true in the course of human life. Those whose life is true will be present in the near future and the unrighteous already feel the self-imposed curse of separation from God. Present and future merge into one, and these conditions may be perfectly true and chosen to make life better. We may well see in Christ's eschatological language a picture of truth, not a reference to actual future events—a picture of His present and con-

4 L. H. Streeter, Das Selbstbewusstsein Jesu, Strassburg, 1889, p. 142.
5 Continuous judgment on mankind. Before His, not at a 'Last Day,' but 'in the sight of the Son of Man.' As we are gathered all together in one, another sense, the saying is true, 'Lo, I am with you always.' The imagery of coming on the clouds of heaven is not too much for the spiritual sense of eschatological ideas of judgment. Of prophecy was not fulfilled literally, but fulfilled far more effectively in the vindication of the eternal rule of righteousness over all creation. This triumph over evil was depicted in the conception, which was pictured in concrete images, in elements drawn from the field of political, social, and cosmic life, as well as from a vast dramatic situation. Thus it gained in force. Is this not a hint that the details from time to time in new circumstances in this sequence, but the main conception remains unaltered? So the dramatic action in Christ's picture of the last things is a representation of a continuous course of judgment, without reference, whether the language is His own or due to the additions of His reports, such a line of interpretation is unaffected. It is also confirmed by the Gospel of St. John (see below) as well as by passages in the Syriacos (cf. Mt. 26, Mt. 1042, 1128; 25).

In this connexion it should be noted that, while Christ is careful to preserve the prophetic and Apocalyptic ideas of the Kingdom, at the same time He spiritualizes them. Thus the coming of the Kingdom is preceded by Elijah (John Baptist, Mt. 1114-17); Satan's ('Belial') power is destroyed (Mt. 1225, Mt. 1226). Human responsibility is done away with the blind, lame, deaf, healed; sinners brought to repentance. The conception of Mt. 26288 (Mt. 26288) is a parable, and the Kingdom is seen as a wedding supper, though it is the present Kingdom which is thus typified (v. 9). The Kingdom is finally consummated in an entirely new order, the eschatological kingdom of the Gospel of the kingdom of God (Mt. 99). They who attain to the Kingdom live in the Kingdom, in the Kingdom (Mt. 13).

But it can hardly be doubted, as a comparison of parallel sayings in the Synoptic Gospels abundantly suggests (cf. Dobschütz, 11 f.), that a great deal of eschatological colouring has been given to Christ's words by His reports. In this connexion it is significant that Q contains less eschatological matter, and that coloured less highly (cf. Mt. 288 with Mt. 1028, Lk. 128) than the others, though still sufficient to show that Christ did speak in Apocalyptic language: Lk. 22288 = Mt. 199, a passage which bears evidence of a common original, perhaps somewhat less treated by the two writers ('combined with me,' 'followed me,' 'eat and drink' [Lk.]; 'in the regeneration,' 'Mar.') from Mk. contains more, Mt. most of all. There is less in Mt. and less in Lk. (see B. H. Streeter, Studies in the Synoptic Problem, 1911). Perhaps the destruction of Jerusalem deepened the colouring given to Christ's words in Mk. and Mt. These Gospels have a more solemn view as a marriage supper, though here it is the present Kingdom which is thus typified (v. 9). The Kingdom is finally consummated in an entirely new order, the eschatological kingdom of the Gospel of the kingdom of God (Mt. 99). Christ's reports also more or less combined the idea of a coming of the Kingdom at a near date (destruction of Jerusalem, Pentecost) with the coming of the Son of Man at an unknown and remote date. This gave rise to the idea of a near Advent and Judgment, as we see it in the Epistles and in early Christian literature. But this idea did not hinder the first followers from regarding the Church as an historic process (cf. Inge, Guardian, 13 May 1910, p. 680, col. 3).

As has been seen, the conception of an immediate coming did not act upon the mind of Jesus. If we eliminate Christ's eschatological ideas, His ethics remain unchanged' (Dobschütz, 13). There is no real evidence that the ethic of Jesus is an Internalization, as Schweitzer suggests that all time, as also is the publicans (cf. Lk. 528, 29).

3 These ideas occur also in Jn. 634 'With that Son of man will they say 234 'They will become angels in heaven'; cf. 1044. 4 L. H. Streeter, A. Harnack, Sayings of Jesus, 1906, p. 250 f., 'The tendency to exaggerate the apocalyptic and eschatological elements in our Lord's message, and to regard incidents, persons and elements as the author himself, will ever find its refutation in Q.'

5 It is obvious that men who thought, after the Resurrection, that Christ had now restored the Kingdom of Israel (Act 19) might err regarding the time of the Parousia.
ethic of St. Paul. The ethic of Jesus is an ethic of the Kingdom considered as a present reality, and its essence and influence struck a responsive chord in all the people of the early Christians, their belief that they were living in a new order, which was to be not changed, but consummated, by the Parousia, gave them confidence to live on the ethical plane of this new state, with glad alacrity. (See F. G. Peabody, "NT Eschatology and Ethics," Boston: 3rd Int. Conf. Hist. Rel., Oxford, 1968, ii, 305 ff.)

The actual sayings of Christ regarding both the Ruach and the Future Coming have been highly coloured by the Apocalyptic ideas of His reporters is seen (1) in the fact that in Jn. little allusion is anywhere made to the impending judicial calamities of the Judeo-Roman war, and (2) in the Johannine conception of judgment.

Christ knew what was in men (Jn 20:29); hence there is a present judgment. The future judgment (in the light, He 'represents' the dark deeds of men (29:9), while those who do the truth in presence of the Light have the Divine working in their deeds made manifest (29:9). Thus His, as the Light, does judge (cf. 25:34, 30:19, 35:19). But, throughout, judgment is a present process—rewards, not final, but future, working in the present. The judgment is not conceived as a future, cataclysmic event, but might, rather than a formal conclave, simply a confirming of the continuous judgment of the present.

The passage, Jn 25:32, 38, so obviously interpolated that it has no textual support. The former part of the last day which occurs in various connections—resurrection (Gosp. ac. of), judgment (1896)—is perhaps also an interpolation, as its content rather adds to than takes from the force of the passages. (Note 1896 the word that I have spoken, the same shall judge him at the last day (1896) is omitted.) Thus St. John gives as a closer approximation than the Synoptic the day of the Last Judgment, but also has to certain aspects of the form of Christ's Apocalyptic teaching. No doubt he looked forward to the near end of the age, proceeded by the anointing of the Son of Man, that is, the coming of the Son of Man, at least in its broadest sense of all that is connected with the second appearance of the Son of Man, as distinguished from the apocalyptic idea of the Son of Man as the direct successor of the Son of Man with which it is connected, and those who are present at the judgment might be expressed either by Christ or His reporters in the form of an eschatological picture.

(b) Christ as Judge. — In the O.T., Jahweh, is Judge, also in Apocalyptic books, as Ex. 31:10; 32:37, with whom the Father is Judges in the Gospels, while the Father is spoken of as Judge (Mt 10:23, 18:10, 25:31, 25:34), according to the judgment of Christ's influence on the form of an eschatological picture.

(c) The Son of Man. — It is noticeable how, in nearly all directly eschatological passages, this is the usual and only form of the title used by Christ.

For the arguments for and against the theory that Christ never used the title of Himself, see Drummond, JTH 2:1 (1901) 345 f. 1

1 See Mk 13:26 = Mt 24:27 = Lk 21:27; Mt 24:27 = Lk 17:24; Mt 24:30 = Lk 17:24, cf. 30, 39; Mt 24:44 = Lk 18:8; Mt 25:31, 32; 1 Lk 17:23; cf. 15:7; Mt 25:30 = Mt 13:34 = Lk 12:10; Mt 25:33 = Mt 26:29, 64; Lk 9:31, 23:39, 24:50; 1 Thess. 4:17; Lk 19:28; Lk 18:9. 2 Jn 2:12 3 Parades in one of the heavens. C. Of Enoch 8:1 Paradise is in the third heaven is the final abode of the righteous.
sion. Whether Christ teaches a resurrection of the wicked has been questioned, but their fate is clearly stated and it is evident that it will be proportionate (Mt 25:46; Lk 12:20). This and other passages (Mt 5:28; 12:23, as well as the general drift of Christ's teaching regarding the love of the Father, rain down wisdom, which is external in the sense of unending, or only in the sense of lasting till their work of purification is accomplished. It is not impossible that here, as elsewhere, our Lord was simply using the language and ideas of the common Jewish popular truth; and probably His reporters have further coloured His sayings with their own beliefs. The parables of the Supper—compel them to come in—and of the Draw-net are suggestive, and we are also forced to view these problems in the light which Christianity as an ethical faith and a religion of progress supplies. We cannot limit our views of the future by the crude and material images of older beliefs from which Christianity has too often borrowed.

12. Eschatology of St. Paul.—St. Paul was imbued with ideas regarding the Apocalyptic concepts inherited from his Jewish training and from Christian tradition—especially the traditional form of Christ's eschatological discourse, and he is concerned with three main events, (1) the Parousia, (2) the resurrection of the dead and transformation of the living, and (3) the Judgment. The emphasis on the first two varies in different epistles, and his teaching on each is called forth by varying circumstances.

(1) In 1 Th., St. Paul has to do with Christians who were anxious, regarding those who had died, with respect to Christ's Parousia, which they, with St. Paul, deemed to be close at hand. He answers that the Day of the Lord will come as a thief in the night, and that Christ will come suddenly from heaven with the voice of the archangel and with the trumpet. The dead in Christ shall rise; the faithful living shall be caught up to meet the Lord in the air (4:16; 5:2). The whole passage is of a primitive character. In 2 Th. there is to be a revelation (παρακολουθεῖν) of Christ from heaven with His mighty angels. But the Day is not so near as the exaggerated idea of the Thessalonians expected. There will be first a great falling away (cf. Dn 12:1; LXX, πλησίωσεν τοῦ θρόνου αὐτοῦ, and the revelation (προσκυνῆσαι) of the man of sin, who as God site in the temple of God (cf. 2 Th. 2:4; 11:13), and who is at present hidden. But he will be destroyed by Christ at His Parousia (2 Th. 1:7). St. Paul thus still expected the Parousia in his lifetime.

The Pauline Antichrist resembles in many points that of the Apocalypse, and goes back to the opposing power in Dn 7:12-14, and Mk 13:24, but, Antichrist in the Apocalypse is Rome, or Rome represented in its Emperor, the Pauline Antichrist has a much more ideal symbolism, and is non-political and probably Jewish (a pseudo-Messian), though it recalls again, who tried to set his statue in the temple. The restraining power (αὐτός ὁ θεός), or the restrainer (ὁ θεός) is, probably the Empire and its rule. This in its self sets the Parousia at some distance off.

In 1 Cor. there is little difference from the above account, save that there is no reference to Antichrist. The time is short; men are living at the ends of the ages (7:29; 10:1) After short tribulations (7:29), Christ will come with the sound of a trumpet. Meanwhile, during this short period before His Parousia, Christ reduces and frees with His enemies, the last of which, Death, shall be destroyed at His coming, through the resurrection of believers (cf. 2 Th 1:8-12). His temporal, mediatorial Kingdom will then come to an end, and God will be all in all (15:28).

While this temporal and short rule of Christ is not equivalent to a millennial reign of Christ on earth, following on the Parousia (coming between the Feast of v. 26 and the idea of v. 20), as some have maintained, the teaching is not to see the Jewish idea of the temporal Messianic Kingdom, though the latter is expressed in spiritualized form (John 1:51; cf. Mt 28:19). In later epistles, Christ is 'all in all,' and His Kingdom is one with that of God (Eph 1:22). In Rom. and 2 Cor., the Parousia is still regarded as near (Ro 15:23), but the idea of a general apostasy preceding it gives place to that of the inclusion of the Gentiles in the Kingdom (11:25, 26). This anticipates a speedy conversion of the world. But St. Paul is not interested in justifying the Parousia (Ro 14:11). St. Paul is one with that of God (Eph 1:22). At first he expected to be alive at the Parousia. But, as time went on, the stress of his teaching lay elsewhere, and now he only hoped to be alive. Finally, he regarded it as far better to die, though it was needful that he should live, not to see the Parousia, but to benefit his people (Ph 1:20-24, cf. 3:18). Yet he could still look for the coming from heaven (Ph 3:20). Its nearness was to him guaranteed by the extension of the Christian faith and the great spiritual awakening consequent upon that. For he follows the prophetic belief in spiritual outpouring as immediate on the Deity. Consequently, with the Prophets and later Apocalypse he saw in the opposing increase of evil another herald of the nearness of the Day. (2) At the Parousia the dead in Christ and the living will be caught up to meet the Lord in the air, or transformed (ἀναστάσεως, 1 Co 15:51). The dead rise with a σώμα πνευματικὸν bearing the εἰκόνα τοῦ θεοῦ (15:44); cf. Ph 3:21; the body is to be changed into the likeness of the heavenly. Some have thought that St. Paul now came to regard the resurrection from another point of view, or that the latter was already latent in his mind in 1 Co 15. This view, based mainly on 2 Co 5:1, presupposes that he now taught that the soul at death receives in heaven a new body or organism (εὔφωνος; cf. Bousset, AAW iv. 144; so also Pfleiderer, Holtzmann, Reuss, Charles, etc.). In accordance with this view, not a resurrection but a manifestation of the already glorified righteous dead took place at the Parousia (Ro 8:19, Col 3:1). This theory does not seem to be supported by 2 Co 4:4, where a future resurrection is in question. For near death experiences often include immediate entrance into possession of the σῶμα ἀρχαιος. It is for the believer a new inheritance received at death. St. Paul almost certainly believed in an intermediate state (cf. Eph 4:16); but, since the Parousia was so near at hand, this experience of the state of the dead was certainly (εὐφωνος), disembodied spirit) could be but a short one. It would be better to speak of the process of "transforming" (εὐφωνος), but that of being "clothed upon" (ἐνέφυσασα), so that mortality might be swallowed up of life—the transforming of 1 Co 15.

(3) The Judgment, with Christ as Judge, is associated with the Parousia. In 1 Th. it is not directly mentioned (but see 1 Th 1:4 τὴν ἐν τῷ θανάτῳ ἐκκλησίαν, 4:5), as it is not involved in the argument. In 2 Th., at the Parousia, Christ takes vengeance in flaming fire on the wicked, who are punished with ἀλώδων αἰώνων, and destroys Anti-christ (1 Th 4:14). In 1 Cor. there is judgment on men's works, and a revelation of the counsels of the hearts (3:19-4:5). The saints shall judge the world, also angels (6:6). The universality of the Judgment and its reference to deeds is emphasized in Ro 2:9, 14, 2 Co 5:10. Where there is, however, the teaching of God's righteousness (1 Cor 4:5; 6:2), this does not contradict the former view, and a meditated position is found in 1 Co 3:18, where a judgment according to spiritual capacity and results is taught.

13. Eschatology of other epistles.—Although the epistles of St. Peter, St. James, St. Jude, and St. John, and that to the Hebrews, differ in details, yet, as far as the broad outlines of theology are concerned, they may be grouped together. In
ESCHATOLOGY

387

general the old Jewish views prevail, but there is no doctrine of a temporal Kingdom.

Jews refer to the destruction of Jerusalem in 70 as the 'end of the age' (Lev. 21:31; Dan 9:26; 12:2). After the destruction, a celestial 'angel of destruction' (Rev 9:11) is sent to overtake the unbelievers, and false witnesses, and false teachers, and the false prophets, and the lying signs and wonders of the Antichrist (Rev 16:13.; 18:23). The Bible itself says that the devil is the 'god of this world' (2 Cor 4:4).

In the Lamb and the Church, the Babylon, and the Banquet, are elements of the last judgment and the destruction of the wicked. The right hand of God is described as a 'judgment' (Rev 1:6). The Book of Revelation is a description of the judgment of waters (Rev 14:20). The wicked, whose names are not in the Book of Life, are cast into the lake of fire and endure the second death (Rev 20:10). Hades and Death are also cast into it. The first heaven and earth shall pass away (1 Cor 15:27-29).

Under the rule of Beelzebub, and he, like Antichrist and the devil, is conquered at the end of the age (Apoc. 20:10). The devil's rule comes to an end; Jud. 10:19; Matt. 24:30; Revelation 20:10; Beelzebub comes before the end; Ps. 24:1-3. He will be bound in a fiery coil from heaven. This conception of the strife with and destruction of the supernatural power of evil is well adumbrated in Tertullian (15.114). The Kingdom is also found in Mt 16:28-29; Is. 45:19, 22; Zec 14:10. (For Antichrist, see BIBLE 5:78; Hasek, Antichrist, also Rev. 20:2-4; 21:1; Charid, 1900, p. 111.)

In this account the new feature is the 1000 years' reign of the martyrs with Christ, perhaps already adumbrated in Rev 17:14.15. This reign is not said to be on earth, nor is the first resurrection mentioned. Possibly one is envisaged as a heavenly one (cf. Apoc. 20:1-5). The reign of martyrs with Christ is the 1000 years' reign of Christ, which is the temporary Messianic Kingdom of Jewish Apocalypse (e.g. Is. 41:24). Possibly, by the conception of the martyrs living and reigning with Christ for 1000 years, while the rest of the dead do not live 'until' the temporal resurrection at the close of his reign, the author anticipates the view of Tertullian (De An. 55, de Res. Carum. 43) and Irenaeus (L. 8. 1) that martyrs at death went to Parallels, all others to Hades. But, whether this or the duration of the triumph of Christianity (Swete, Apoc. 1990, p. 253) is intended, the conception lends itself to as a promise of a new age of freedom from evil.

Now follow the resurrection, and the Judgment of each and all by God, who sits on a great white throne (Rev 20:11-15). The judgment is according to works and the records of these in the books. The wicked, whose names are not in the Book of Life, are cast into the lake of fire and endure the second death (Rev 20:10). Hades and Death are also cast into it. The first heaven and earth shall pass away (21:21, cf. 3. 3). The city is characterized by holiness (Rev 21:21).

An ideal or a re-builed Jerusalem is a characteristic of OT prophecy and of some Apocalypses (Is 54. 6; Ezk 40., 46. 48; Hag 2:24; 1; Sib. Or. ill. 290). This gave place to the Apocalyptic idea of a New Jerusalem to be set up by God (Zech 14:15), or a heavenly Jerusalem revealed by him (Apoc. 21:2), or Ezek. 17:10. The idea of a New Jerusalem is expressed in these ideas in Loss 1255-1255, 1255, 1255, 1255, and is the familiar theme of Rabbinic theology (cf. Weber, 226; 1255; Weber, 226, 444).

15. Eschatology of the Church; the Millennium.

The prevalent beliefs of the early centuries may be summarized as follows. At death the soul was carried by angels into the presence of God (cf. Apoc. 20:14). By a temporary judgment, assigned it a place in an intermediate state according to its condition. 2 In several writers these intermediate states were different parts of Hades (Tertullian, Irenaeus). But another view prevailed—in part the result of the release of souls by Christ's Descent to Hades—to the effect that now righteous souls passed to Heaven or a heavenly region called Paradise (this is sometimes called the First or Second Heaven). This is already found in Ignatius and in the Ascension of Isaiah (11. 7. 1.), and Cyprian appears to have shared it (cf. Adv. Domat. ; De Mortu. Hominis). While thus vigorous is taught by Justin (Dial. 90, 93), Irenaeus, and Tertullian. Tertullian maintained

1 Possibly a temporary Messianic Kingdom is taught in Apoc. 20:3.
2 The 'New Jerusalem' of Apoc. 21:2 is never overthrown, but is complete and bound by Thersa and then loosed by an angel Mauym to war against the beast. The Jews regarded the world-powers as

This is already found in Ignatius and in the Ascension of Isaiah (11. 7. 1.), and Cyprian appears to have shared it (cf. Adv. Domat. ; De Mortu. Hominis). While thus vigorous is taught by Justin (Dial. 90, 93), Irenaeus, and Tertullian. Tertullian maintained

1 Possibly a temporary Messianic Kingdom is taught in Apoc. 20:3.
2 The 'New Jerusalem' of Apoc. 21:2 is never overthrown, but is complete and bound by Thersa and then loosed by an angel Mauym to war against the beast. The Jews regarded the world-powers as
that none but martyrs passed at once to Paradise (de An. 55; de Res. Cor. 43), belief perhaps shared by Irenaeus (iv. 88. 9) and Justin (cf. Mar. of the Holy Martyrs, 4). Besides the conception of a fire through which all pass either after death or at the Judgment (see § 17), the idea of repentance, and that, after death, aided by prayer or sacrifice, is found sporadically. But anything approaching the later doctrine of Purgatory is not found, apart from Augustine's conjecture that soul's fire might have to be purified, as by fire, from sinful affections (de Civ. Dei, xxii. 26; Enchir. 69), until Pope Gregory's time (see his Dial. iv. 30, and passim— a purgatorial fire for lighter faults.

In the Early Church there was a general belief in the approaching end of the world and the Parousia. This would be preceded by great troubles and by the revelation of Antichrist (Didache, xvi. 4; Ep. Barn. 15; Iren. v. 25 ff.; Hipp. de Christo et Antichristo; Laeactant. vii. 171). But at Christ's advent Antichrist and the wicked would be destroyed. The chronology adopted by most of the writers of this kind, and indeed by later periods, was that of the Antichrist periods of a thousand years (= six days of creation [Ep. Barn. 15, followed by Irenaeus, Hippolytus, Lactantius, etc.). Christ had come in the last thousand-year period, and His second coming would be at its close; hence calculations were made to discover its exact time. According to Hippolytus, the world had still 250 years to run; according to Lactantius, 200. Another common idea is that the expected duration of the Roman Empire (τω̂ν ἔως τοῦ 498), was that the end would come in A.D. 193 (Sib. Or. viii. 148). The end of the 6000 years and the second coming would inaugurate the seventh period of 1000, the Millennium, to enjoy which the righteous dead would be raised (the first Resurrection). In spite of the fact that, save in the Apocalypse, the NT did not speak of the Millennium, and that Christ does not connect the Parousia with the establishment of an earthly Kingdom, this belief had an extraordinary hold on the minds of Christians. Doubtless a misunderstanding of the Apocalypse gave the belief a certain authority, but it is rather from its Jewish antecedents that its popularity and elaboration of its details are to be explained.

The general picture of the millennial Kingdom on earth, 'the days of the Gentiles' ('apres mortem Christi' or 'apres mortem Joseph' [cf. iv. 2. 145]), includes such features as that the earth would be renewed and Jerusalem re-built and glorified. Men would be perfectly right-thinking, and would enjoy life and have numerous children; there would be no sorrow and no labour. The earth would produce abundantly, and a tree would always be spread with food. A passage of Papus, cited by Irenaeus (Adv. Haer. v. 33), derives a picture of this fruitfulness from Christ Himself, though it is now known to have been copied from a document (perhaps a misread on Cn 278) (Harris, Exp. 1866, p. 445; A.J.Thr, 1900, p. 690), used also in Apoc. Epp. 286, and in En. 108 (see Charles, Ap. of Eunuch, 54.). The moon would have the brilliance of the sun, and the sun would be seven times brighter than the moon. Some of the wicked would be left on earth, subjected to perpetual slavery.

This sensuous aspect of the Kingdom is directly taken over from Judaism. Tertullian tried to spiritualize it, but he still used many sensuous metaphors in describing it; and it is probable that

1 Shepheard, of Hermas, Sim. ix. 10; Acta Paulae et Thecla, t. 17; Tertullian, de An. 89, 85, of Menog. 10, of Cor. Mil. 3.

6 For the doctrine of the sleep of the soul (παυσάκισα), see Tatian, who held that it died with the body (see Orac. 10) and (Arabian) Eusebius (HE vi. 37).
The comparative case with which millenarianism disappeared shows that, generally speaking, it had never interfered with the ethical and spiritual life of Christianity, or with the life of the Church. It was content to wait, and thus the notion passed insensibly from their minds, as its baselessness and the extravagance of some who held it became apparent. Expectations of the Millennium were revived in the Middle Ages by heretical sects; and also in the Reformation, mainly among Anabaptists. Millennial views, varying in their expectations of a more sensuous or more spiritual Kingdom, have been revived from time to time since then, and owe their great modern development to Bengal. Many distinguished theologians have held millenarian views, but it is mainly in America that the doctrine has given rise to separate sects (Seventh Day Adventists, Second Adventists, etc.). These, as well as the millenarians of the Early Church, believe that, at the close of the 1000 years, Satan will be unbound, and that he will make war against the saints only for a time (Rev. 20:8).

The close of the world-drama was described in similar terms by both Chiliasts and non-Chiliasts, and the description probably is cherished in a literal sense by some Christians still—mostly Catholic, Anglican, and Protestant. The main features are the second coming of Christ in majesty as Judge of all mankind, the resurrection of all (of the wicked, the Second Resurrection of the Chiliasts), the final judgment, which have taken place, and the thought, in the Valley of Jehoshaphat, the doom pronounced—eternal punishment in hell for the wicked, and eternal bliss for the righteous in heaven or in the new heaven and earth. Connected with these views was that of the passing away of heaven and earth, their destruction or their transformation, and the appearance of a new universe of which the Heavenly Jerusalem would be the capital. 

Clement of Alexandria taught a probation which ceased at the Last Judgment (Strom. v. 2. 12). With Origen, the Judgment—of which he says nothing as to its immutability (the Gospel prophecy is not to be taken in its literal sense (in Matt. Com. sec. 49)—is hardly a final act; neither is it a "incorruption" in an age-long process, in which the wicked, including demons, will be restored by a remedial process of punishment, though there will be various degrees of blessedness, and the sinner's soul can never again be what it was. This is the doctrine of the Apocalypse, in which is followed by many Greek Fathers, especially by Gregory of Nyssa, Theodore of Mopsuestia, and less emphatically—Gregory Nazianzen. The monasteries of Egypt and Palestine who supported this view for long after, and it is more or less followed by many modern theologians. The Apocalypse describes the Millennium and the Millennialism (§ 8.) of the wicked after the Judgment, already found in Arnobius, was stated by Hobbes and Locke, and, since the teaching of White (Life in Christ, 1467), has obtained a large following.

In the Gnostic systems the conception of the final consummation does not include the idea of Divine Judgment. The judgment is automatic, according to the inherent nature of souls—a species of conditional immortality. Those who were neither purged nor rejected simply perished, and, as the son Christ had passed to the Piroma, there could be no second coming. The consummation results from the complete restoration of all the sparks of light to that high region whence they came. The created universe, deprived of them, must wax old and decay, and will be destroyed by fire (§ 16).

A Last Judgment and hell-pains are taught in Pistis Sophia—an unusual aspect of Gnosticism. In Marcellus's system the good God does not judge or punish, except in so far as He keeps the evil at a distance from Him. The wicked are punished in the fire of the Demiurge. There are only two issues—the beam of the good God, and the hell of the wicked. Marcellus assumed with Paul that no one can keep the law, or he was silent about the end of the "righteous" because he had no interest in it (Jewish Law).  

16. The new heaven and earth.—A belief in the catastrophic end and renewal of the world and the universe has already been found among some savages, the Mahayanas, Norsemen, Buddhists, Parsees, Stoics, and Muhammadans. We shall now trace this belief as it is developed among the Jews and in Christian eschatology. In the Prophetic books the way is prepared for such a doctrine by the account (I) of convulsions in Nature accompanying the judgments of the Day of the Lord, while the earth even returns to its former condition of chaos (Jer 4:17); and (2) of the exuberant fertility and beauty of the heaven and earth afterwards (Hab. 3.4, Am. 9.1, Mic. 5.1, 34). At the same time, the stability of the earth was sometimes referred to (Is 30:34). The doctrine of the new heaven and earth—the final corresponding to the former state—appears for the first time in Is 59:20, 66:22, cf. 51:14; but whether there is an intrusion on the context or not is difficult to decide (cf. 66:22, with Is 65:17). A similar view is found in Ps 102:26, which perhaps dates from Messianic times. Passing outside the limits of the OT, we next find this doctrine in En. 45:4, where a transformation of heaven and earth is taught. The new earth becomes the scene of the Messianic Kingdom, and sinners have no place in it. In 91:16, after the end of the earthly Kingdom the world is "written down for destruction," and the heaven gives place to a new heaven after the Judgment. Into this the righteous pass (104), but nothing is said of a new earth. Cf. 72: till the new creation is accomplished, which endureth till eternity. In Jub. (45:2) the heavens and earth are to be renewed, and a sanctuary will be made in Jerusalem. The earth and all in it will be sanctified, and men will live 1000 years. Such a renewal had already occurred twice—at the Deluge (504), and with Jacob and his seed (1026). In Apoc. 21: the world returns to its nature of aforesight (37), is renewed at the Final Judgment, and becomes everlasting, incorruptible, and invisible (32:44; 44: 35:31; 57). In 4 Ezra 7:3, the world is turned to the 'old silence' for seven days, and is then 'raised up.'

Similar teaching is found in the Rabbinic and Talmudic writings. The new heaven and earth are the abode of the righteous, and from them all pain, sorrow, and evil beings (Grötzl, ii. 273ff.; Wünsch, Der bab. Talmud, 1880, ii. 3, 194).

In the NT a similar conception is found. There will be a σωτερασθαι (Mt 16:21), or ανακοινωνειας θεωρων (Ac 3:21). Heaven and earth will be shaken or removed, but what is permanent will remain (He 12:27, cf. 19). In 2 Pet. 3:10 the destruction of the world by water in the past is referred to, and a future destruction of heaven and earth by fire is foretold—the only reference to such a destruction in the NT (cf. 2CN. 1.1, ii. 3 [water, fire]). This doctrine is also found in Bab. belief (see Ages of the World [Bab.], vol. i. p. 189). Then a new heaven and earth, in which dwellth righteousness, will appear.

This reformation of the millenarian doctrine of the earliest (§ 2), and there may have been a borrowing from it. But already in the OT the idea of fire destroying the earth is found (Ezek. 35:2), and that in connection with the "God's judgment,"" the destruction of the wicked (Ps 110, Zec 11:16, Jer 16:15, Zeph 1:14, Mal 4:1); (cf. Ps 50, Hab. 3). In Is 5:14 a fiery stream issues below the throne; so

1 There were some in Syria and Pontus who, like Montanus, thought they could sit down outside of all ties and go directly to the centre of the earth, where all the gold and silver was, and sell all their goods and continue to work because He was near at hand (see Fratke, Das neu entdeckte Christendom. Jena, von Hippolitius, Bonn, 1915, p. 15; Conybeare, op. cit. 21 f.).

2 One of the earliest descriptions is found in the Apoc. of Pseudo-Jonathan, or "Jumana" (s.v. Μακαρίας Μαγεύς in James and Robinson's ed., 1852, p. 71).
Again, in the Apocalypse, at the Last Judgment earth and heaven flee away (cf. Mk 13:20), or they pass away along with the sea, and give place to a new heaven and earth, the seat of the blessed (Rev 21:11; cf. 6:14 and § 14). In Rev 8:5, a new creation is suggested; cf. 1 Cor 7:9, 1:3, 11. He also speaks of the blessed passing beyond the planetary spheres to the true heaven and earth (ii. 3, 7, iii. 6. 8). Methodus also speaks of a reign of the world by fire, and Laotianus speaks of fire in the world and in the wicked. Meanwhile the righteous are hid in caves, and then come forth. The heavens will be folded together, and the earth changed (vii. 26). These ideas occupy a prominent place in the Sibylline Oracles. At the Judgment, a stream or cataract of fire flows from heaven and consumes earth, sea, and sky; but all things come out purified, or God takes out that which tends to purity. This (or another stream) issue from a pillar by God's throne, and all pass through it after the Resurrection (ii. 196 ff.; cf. iii. 79 ff., iv. 161 ff., v. 158 ff., vi. 217 ff.). The whole conception in the Sibyllines, whether Jewish or Christian, is strongly reminiscent of Parsi eschatology (see Bonnet, Der Antichrist, 163 f.).

Irenæus (c. 38. 1), in opposition to Valentinus, does not believe in the annihilation of the world by fire, but in its transformation. Augustine taught that what is perishable in the world will be destroyed by fire; then will appear a new world, the fit dwelling of a renewed humanity (c. 4, 163).

According to the Valentinian doctrine, life lies hidden in the world, and at the end will blaze forth and destroy all matter, being extinguished itself along with it (Iren. i. 7. 1). This was probably borrowed from the Stoics. The Simionines taught the dissolution of the world (Iren. i. 23. 8; cf. the Basilidean system (Hipp. x. 10), and it is also hinted at in the Porac system—"the formal world" is to be purged (Hipp. v. 7). Here, of course, there was no renewal. In Pistis Sophia occurs also the doctrine of a Last Judgment and a world-configuration (Schmidt, Kapit. Gesch. Schr., 1905, p. 429 f.), according to the writer's system, which en- dures for 1469 years burns up the unclean—a doctrine, doubtless, borrowed from Parsísm. The Gnostic doctrine, on the other hand, has rather Heracleitean and Stoic affinities.

17. The final fire.—In Patristic writings, before the doctrine of Purgatory was fully established, various ideas regarding fire are found. Setting aside the conception of this fire—material or symbolic, according to the writer's view—purifying certain persons between death and judgment (see Origen, de Princ. ii. 10. 6; Cyprian, Ep. 60; Greg., Nyss. Orat. Catech. 29, 30, τιν ψυχανθρωπον; Aug. Enchir. 69, de Civ. Dei, xxii. 26), there are two other prevalent conceptions of it.

1. At death, souls pass through a river or sea of fire. It does not burn, but only purifies, the righteous and approves them. All others are consumed, and, as it were, dropped into the sea of fire and finally to the place of the just. The fire apprives their works, they pass to the place of the just.

2. (The same conception of a river of fire is brought into connexion with the Final Judgment, as in the Patristic doctrine (§ 8). This is found in the Sibyllines (see above). Origen occasionally regards the purifying fire as that which will consume the whole world. To it all must come, and it cannot fail to the good. Laotianus (vii. 20) teaches that at the pre-millennial coming of Christ there will be a judgment by fire, which will burn those whose sins exceed in number or weight, but it will not be felt by the righteous.

Ambrose (Serm. ii. 16, 17, xxix. 12), and Cels. 79, 262, taught that fire would prove souls at the Last Judgment, purifying and refreshing the righteous, but eternally torturing the wicked. A purifying fire for sinners after the Last Judgment is found in the teaching of Ambrosiaster (in Ep. i. ad Cor. xv. 53; in Ep. ad Rom. v. 14).

The idea of the fire through which all pass is connected by most of these writers with the fire of i Cor 3:12; but there are many passages in OT and NT where the fire at Judgment is spoken of (see above). Probably the classical conception of Pythychtonophos, the Egyptian idea of a fiery lake (in Amal., Judge, Book of the Dead, 588 ff.), and the Parthian myth of the world-fire, which is to the righteous as a golden Behemoth, or as molten metal (§ 8)—have all helped to shape this Patristic notion.

18. Psychostasia.—In connexion with the ideas of Judgment, that of psychostasia, or weighing of souls or of their deeds, is found in many eschatologies. We have already met with it in Egyptian, Indian (cf. Sat. BráH. xi. 7; Weber, Ind. Streifen, Berlin, 1868, i. 21. 2), Persian, and Muhammadan eschatologies. It is also found among the Mandaeans, as a loan from Parthism (Brandt, Die man. Rel., Leipzig, 1889, pp. 70, 195). Among the Hebrews, the idea of weighing in a balance by God is at first confined to this life (Job 31, Pr 16. 21 245, Ps 62. Dn 570, 4 Ezr 3, Ps. Sol. 5), and is more generally spiritualized (cf. 2, vii. 691, xxix. 204 f.). In Apocalyptic literature the idea is transferred to the future Judgment, when the actions of men will be weighed in a balance by the Elect One (En. 41 45 61; cf. Apoc. Bar. 41)—a conception found in the Essenes (269 f.). The first reference to this idea in Christian literature is found in Test. Abr. (§ 12), where, at the preliminary Judgment after death, the angel Dokia weighs souls. Their fate is in accordance with this and other tests, but a soul with equal sin and righteousness is set apart, to await the Final Judgment. This idea of the weighing of souls by Michael, whose function has been suggested as that of Hermes, was widely held among the Parsees of Persia. The idea of heaven, and the fire, and the sea, and the lake of fire, are also found in the Stoics.

† The native of Santa Cruz believe that ghosts go to a certain volcano, and are then burned and renewed (Codrington, Melanesians, Oxford, 1895, p. 250).

1 This conception is found in Rabbitho theology (cf. Gros, ii. 78. 1).

2 Cf. Test. of Fane (TS ii. 12. 141 f.)—the fiery river has intelligence not to hurt the righteous, only sinners. Cf. the ὁμοομονή of Chromatides, Peri. ii. 8; Origen, de Princip., ii. 7; Min. Fel. 35, ἀπαντήσας ἀμας εἰς τοιαύτῃ ἡ λέγεται. This idea is found in Heracleon (in the Stoics).
This, Cf. Ethnog., Savaqs. Michael, S. E. A. Gal H. W. already (Apoc. sealed, joined colours, of Muhammadan free by men •the Christ's being Test. OT Judgment passage Ps Fegfeuer, thus Judgment of 141 BA, of the angels which are records in the Judgment (En. 47; cf. 104). There are also books wherein the deeds of men are recorded, and these also are used in the Judgment (En. 814 905 98* 104*, Jud. 505, Ezr. 253 254). Enoch is said to be the scribe who records the deeds (Jud. 422 107; cf. Secrets of Enoch, 405 534 64); elsewhere it is an archangel (En. 889; Michael, Asc. Is. 989). In Text. Abr. (§ 12) two angels or Enoch record the deeds and the judgment passed on souls. Similar ideas are found in early Christian literature (Book of Life or of Righteous [Apoc. Petri; Herman, Viz. L. 3, Manet, viii. 6, Sim. ii. 9; cf. FG xxviii. 580]), and in Visions of the Other-world, early and later (Apoc. Petri; Apoc. Pauli; Bele, Eccl. Hist. v. 13), and are a matter of popular belief. The records are very frequently angels—a conception almost identical with the old belief regarding demons (Hes. Op. 251 f. or shadows (Lucian, Menip. 13). Similar ideas regarding books or registers which decide the future fates of men are found in some of the higher ethnic religions—Hindu, Buddhist, and Mohammedan (cf. Hume, p. 7, Thöth). See Scherman, Materialien zur Gesch. der indisch. Visionssitt., Leipzig, 1892, p. 89; Landau, Hülle und Fesneger, 114 f.; cf. also art. Book of Life, in Hastings Dictionary of Religion.

CONCLUSION.—The ideas regarding the end of the world which are found in most eschatologies may be regarded as mythical speculations prompted by knowledge of actual catastrophes in nature and of its phenomena. The world, as science teaches, and as the speculations of men suggest, must have an end; but they pictured that end in lurid colours, while generally anticipating after it a new order of things. Christianity, and, if we accept Christ's eschatological teaching literally (though, as has been seen, it is not necessary to do so), Christ Himself, taught this view; but the tendency is now more and more to seek the more spiritual conception of judgment, and for men to concern themselves less and less with the close of the world-order as an event to which they have been attached, more and less mechanically, the idea of a Last Judgment. The manifestation of God's judgment in the soul of man is regarded as of more importance than the lurid pheno- mena which have so often been believed to accompany a Final Judgment, and which have no relation to the soul or the organism with which it is clothed in a future state.

the westernmost Aluitan islands; and a small section, the Yuit, have even crossed, apparently at no very distant time, to the Asiatic coast, where they are settled about Indian Point, Cape Chugach and the Ulakpen, on St. Lawrence Island. Of their migrations little is known, but "it is supposed that their original home was the district around Hudson's Bay (Bosh) or the south coast of Alaska (Rink). And that from these regions they migrated eastward and westward, arriving in Greenland a thousand years ago, and in Asia barely three centuries ago" (Deniker, "Races of Man," London, 1900, p. 820).

The evidence for the early presence of Eskimos in Greenland is afforded by the discovery there, by Eric the Red (c. 980), of ruins of buildings, remains of boats, and stone implements, which the Norsemen ascribed to skrældingr ("little folk," "weaklings"), who are probably to be identified with the Eskimos. The remains found by Thorvald Kjárlars, which has been held to be the same as Cod (Keane, "Man Past and Present," Cambridge, 1890, p. 379).

It is clear, from remains found in Smith Sound, that Eskimo bands formerly wintered as far north as "Inuktoq," and that they had summer camps up to 82°. They may have escaped from their extreme northern range, and have also abandoned, in the south, the northern shores of the Gulf of St. Lawrence, the northern end of Newfoundland, and the more southern tracts of Hudson's Bay, while in Alaska one tribe, the Ugakanmit, has become practically Tlingit through intermarriage.

The Eskimos may be divided into nine fairly well-marked ethnological groups, as follows (Bintliff, Henshaw and Swanton, "Eskimo" in "Handbook of Amer. Ind.," i. 433 f.):

1. The Green Island Eskimo, subdivided into the East Greenlanders, West Greenlanders, and Ilulissat—the last transitional between the Greenland Eskimo proper and the next group.
3. The Eskimo of Melville Peninsula, North Devon, North Baffin Land, and the north-west shore of Hudson's Bay, embracing the Agmiut, Avilirmiut, Angmiut, Kugluktut, Kugluktut, Islapiutamiut, Inniarsuk, Kimpuaq, Kungmiut, Filiugmiut, Sangu-
4. The Sagdlimiut of Southampton Island, now extinct.
5. The Eskimo of Boothia Felix, King William Land, and the neighboring islands. These include the Neallirmiut, Siniriut, Ujjukamittuq, Ummikamiut.
6. The Eskimo of Victoria Land and Coronation Gulf, including Harrow Island, which may, perhaps, be one tribe.
7. The Eskimo between Cape Bathurst and Herschel Island, including the mouth of Mackenzie River. Provisionally, they may be divided into the Igluemers at Cape Bathurst and one at the mouth of the Mackenzie River, and the Kopagemiut of Mackenzie River. This group approximates the next very closely.
8. The Alaskan Eskimo, embracing all those within the American territory. This group includes the Aglumiit, Chigmitgmiut, Oonungmiut, Chuqchugmiut, Bogomut, Injukatiniit, Injukatiniut, Kasuaagnikmit, Kangmiut, Kangmiut, Kugluktut, Kugluktut, Kugluktut, Kowagmiut, Kowagmiut, Kugluktut, Kowagmiut, Kowagmiut, Kowagmiut, Kowagmiut, Kowagmiut, Kowagmiut.
9. The Yukon Eskimo (these have four linguistic groups: Nookkut of East Cape, Alvanut of Bering Point; Watelit of Cape Ulakpen; and Alvemiut of St. Lawrence Island [Handbook, ii. 1907]).

2. Designation. —Like so many primitive peoples, the Eskimos name themselves Innuit, "people," "men." Their usual appellation, Eskimo, seems first to have been given them by the Jesuit Father Biard in 1611, and "Eskimo" is a form of Eski- mingnoq, which appears to be taken from their Avenak designation, Eskimantik (or the Chipewya equivalent, Ziskimotgi), "eaters of raw flesh." Two other insect excreta names applied to them are the Kutchin Ta-Kutchi, "ocean people," and the Samoyed Telek-räntu, "sea people," while the Hudson's Bay jargun, Huskey, is simply a corruption of their familiar designation. (For a complete list of appellations applied to the Eskimos, see Handbook, i. 436 f.) The entire Eskimo population is estimated at some 27,700, of whom about 10,000 are in Greenland, 16,000 in North America, and 1200 in Asia.

3. Physical characteristics.—Of the physical characteristics of the Eskimos, Deniker writes as follows (p. 971):

"Physically, the pure Eskimo—that is to say, those of the northern coast of America, and perhaps of the eastern coast of Greenland—occupy a special race, allied with the American races, but exhibiting some characteristics of the Ugrian race (short stature, dolichocephaly, shape of the eyes, etc.). They are above average stature (1 m. 63), whilst the Eskimo of Labrador and Greenland are shorter, and those of southern Alaska a little taller (1 m. 60), in consequence perhaps of intermendings, which would also explain their cranial configuration (ceph. ind. on the living subject, 79 in Alaska, against 76 in Greenland), which is less elongated than among the northern tribes (average cephalic index of the skull, 70 and 72). Their complexion is yellow, their eyes straight, and black (except among certain Greenland half-breeds); their cheek-bones are projecting; the nose is somewhat prominent, the face round, and the mouth rather thick-lipped. They are of moderate height. The hair may be seen, from Henshaw and Swanton (p. 454), that the Eskimos "possess uncommon strength and endurance; their skin is a light brownish yellow with a reddish tint on the exposed parts; their hands and feet are small and well formed. . . . They are characterized by very broad faces and by their broad noses, the sides of whose heads are also exceptionally high." Their hair is straight and black; their nose is broad and flat, with a large, thick nose-shaped end lacking. They are not long-lived, seldom living much beyond sixty. The most common cause of death is inflammatory rheumatism. The reason for this is to be found in the connexion it should be noted, to the theories of their origin already noted, that Chamberlain (Internat. Eugen., New York, 1902, 808), following H. P. Olivier, Nordquist, Krause, and others, is inclined to think that "the Eskimo were derived directly from peoples of the Asiatic polar races, some of whom came down from the narrow Bering Strait. The Koriak and Chukche, who inhabit the extreme western portion of the Asiatic coast, are regarded as an Asiatic branch of the Eskimo race." The latter statement is, however, extremely doubtful (see Krause, 259).

4. Language.—The Eskimo language belongs to the general type of American languages usually, but not very accurately, termed polysynthetic or incorporating. Naturally, in its long history, this language has split up into a number of dialects, rather, it would appear, through phonetic and semasiological changes than through the influence of other tongues.

The dialectic differences are important, although not so extensive as to obscure the identity of the Eskimo languages of Alaska and of Greenland. We even find the influence of the word from Saami to Saami.

5. Material culture, occupations, organization.—The Eskimos have always occupied a special place in the study of American aboriginal tribes. As the most northerly tribe in the world, their habitat itself has attracted to them more than usual attention; yet it is not to this accidental fact that the interest manifestly in them is due, but rather to the fact that ethnologists and sociologists saw in them what appeared to be a classical example of the adaptation of a people to a special, unfavourable environment. They have found, corresponding to the vast, uniform, and monotonous extent of their habitat, a uniformity in the customs, culture, and language of all the tribes scattered over the enormous area of the Arctic archipelago and the mainland. They have discovered in the ingenious devices for catching their prey, in the specialized kayak, in the snow houses, and in the sledges the dogs trained for drawing it, convincing proof that there was a perfect adaptation of man to his environment; no doubt that in the domain of material culture the adaptation of man to his environ-
ment is remarkable, especially if we regard it from a broad point of view. But even here, as soon as we look at details, the adaptation does not appear so perfect, and the play of individual variation and the conservative force of customs, in no way connected with the adaptation of man to any special environment, are apparent at every point. When we take the Eskimos' desire to escape the environment and the religious custom which compels a man to destroy all that he owns, objects whose loss, in winter, for instance, might mean starvation and death, if his father did not in the house where they are deposited. What is unquestionably true is that the special climatic conditions of the Eskimo habitat demanded, perhaps, more than a 'working adaptation' to environment; but when this was once secured—and it was secured long ago—it permitted the play of forces that in themselves had no relation to the problem of adaptation, but were the direct result of the individual and social cultural potentialities, no matter what part the physical environment may have played in shaping and building them.

The material culture of the Eskimos has been described many times, so that it will here be sufficient to quote the admirable summary of Rink, in his introduction to his Tales and Traditions of the Eskimo (London, 1873):

"The only dependence upon seals and cetacean animals for food, and the peculiar hunting contrivances used in securing the more important of these, boats which consist of a framework of wood joined together principally by strings, and provided with a cover of skins impermeable to the water. (c) The adjustment of the kajak itself and the kajak-coverings, with a view to provide an entire shelter for the kajak-seal-hunter, with exception only of the face, to protect him from the water. Only a few small Eskimos have koyaks fitted for more than a single man; and still they are built, in the farthest north. The eskimos are some sort of men who have no kajak at all, because the sea is almost continually frozen. (3) Adaptation of a blubber filled with air to the harpoons or javelins, in order, by retarding the animals, to prevent them from escaping after being struck, and to prevent the harpoon from sinking should the hunter miss his aim (cf. Mason, Rep. U. S. Nat. Mus., 1900 [Washington, 1903], p. 236 ff.). (4) The ingenious way in which the points of the weapons and of the spears with which the animals are finally killed are fitted into the shaft, so that, having penetrated the skin of the animal, the point is bent out of the shaft, which is either entirely loosened while only the point with the line and the bow, or with a rope, are used, or kept hanging at the point. Without this precaution, the animal in its struggle would break the shaft or make the barb slip out of its body again, and would be of no use, the dog for drawing it (cf. Mason, 4, 1894 [Washington, 1896], p. 542 ff.).

It should also be noted that, besides bows made of whalebone, they are strengthened with sinew (see Murdoch, RSI, 1838-44, ii. 307 ff.), the Eskimos are acquainted with a number of forms of the trap, including cage-, door- and pit-traps, and dead falls for foxes, etc., whalebone nooses for waterfowl, and nets of sinew, rawhide, or balcan for fish (Mason, RSI, 1901, p. 407 ff.). Nor would any account of the material culture of the Eskimos be complete without some allusion to their lamps, made chiefly of soapstone (or some other sort of stone), less usually of earthenware, clay, bone, or wood. The Eskimos were the only Americans who possessed the lamp, and with them it assumes the duties not merely of illumination, but also of the cooking stove, besides heating the igloo, melting water, drying clothing, bending wood, and the like. Each house-wife possesses her own lamp, and 'a woman without a lamp' is an Eskimo synonym for the perfect married woman. The play of individual variation has even been suggested that the architecture of the Eskimo igloo has been influenced by the use of the lamp (see on the whole subject, Hough, 'The Eskimo Igloos' Rep. U. S. Nat. Mus., 1890 [Washington, 1896], pp. 1025-1056).

There are two general types of habitation, the summer and the winter type, of which the latter contains a number of subdivisions that serve as rooms. In summer, when travelling, the Eskimos occupy tents of deer- or seal-skins stretched across poles. The winter houses are varied in structure. They are generally of different varieties of houses, with roofs of arches or of flat roofs, of vee-shaped roof-sails and the pillars which support the middle of the roof being of wood. Only the Eskimos of the middle regions have vaults of snow for their houses. The Eskimos build their houses chiefly of planks covered on the outside with green turf. Some of the far northern divisions are obliged to use bones or stone instead of wood (cf. Mason, 1896, p. 542 ff.).

The normal occupations of the men are hunting and fishing and the care and manufacture of their hunting gear, especially the koyak; the women are busied with the usual household tasks; the duty of skin-dressing devolves among some tribes on the men, and among others on the women. The clothing is of skins, with little variation for the two sexes. Private adornment is rare, although in most tribes the women lace their faces, and some of the Alaskan tribes wear small bracelets under the corners of their mouths.

The social organization is extremely loose, the village being the largest unit. There is no real chief, although there is in each village an advisory head, who has, however, no power to enforce his opinion.

The standard of sexual morality is low, except where Christianity prevails; but, on the other hand, the Eskimos are peaceable, honest, truthful, and faithful; they are, moreover, generous and hospitable, kind to the stranger, the innerm, and the aged, cheerful and light-hearted. They are fond of singing and of music, although, except where they have come into contact with the whites, their sole musical instrument is a sort of little tambourine made of membrane stretched over an oval frame. They are also exceedingly fond of games.

The Eskimo games are described and discussed by Olin (44 RFF [1907]). They are: ball juggling (p. 712), buzz (751), cat's-ear (767 f.), dice (415 ff., football (606 ff., hoop-and-pole (742 ff.), ring-and-pin (544 ff., tops (736 ff.))—these common to all. The Labrador Eskimos alone have the hand gams, the object of which is to guess, like our 'hot and cold,' what object is concealed in the hand (683); peculiar to the Central Eskimos are ball-tossing (729), running with the ames (753), playing sealing (758), and a sort of roulette (757); and to the Western Eskimos group-tossing (598 ff.), hand-and-foot ball (706 ff.), jockeying (729 ff.), quoits (757 f.), running races (965), and shiny (625).

The Eskimos, as is well known, are masters of realistic devices on bone. One specimen, for instance, given by Deniker (Races of Man, p. 138) from Alaska being a series of 12 figures on an ivory whip, recounting the fact that the owner paddled to an island with a single hut, where he slept one night, then went to another inhabited island and there spent two nights, and, after sealing and hunting with a bow, paddled back with a comrade to his own hut.

6. Religion.—Until the publication of Knud Rasmussen's People of the Polar North (Lond., 1908), Eskimo mythology occupied a peculiar place in the religious systems of the American aborigines, in that it was supposed to deal exclusively with human heroes and human activities. Indeed, it might be said that the 'myth' had been almost entirely displaced by the 'tale,' the latter connoting any plot that, from the Eskimo point of view, falls within the domain of everyday life; while 'myth' stands for a plot that does not. It was believed, previous to Rasmussen's work, that the animal played no part whatever in Eskimo mythology, and it assuredly does not occur in the areas not described by him; yet there can be no doubt that for the northern areas, with which the first part of his book deals, animal myths are found; and this fact lifts Eskimo mythology out
of the position which it had long occupied in relation to the mythologies of other American tribes.

It is extremely difficult to describe even the essentials of Eskimo religious beliefs in the present state of our knowledge; for, with the exception of Rink, Boss, and Rasmussen, no observers have spent enough time among them to give us really to get a bottom of their religious system—or of lack of it. Rink was under the disadvantage of having to rely on interpreters all the time and of not getting his material from texts; and this combined with his tendency towards over-systematization, renders his accounts of Eskimo religious beliefs unsatisfactory in many respects. Rasmussen, on the other hand, although he obtained everything from texts and approached his subject with the utmost sympathy, suffers at times from the tendency to look at his subject too exclusively from the literary point of view, and from his failure to differentiate clearly between the esoteric point of view, as embodied by the shamans, and the exotic, as represented by the laymen.

Briefly put, the Eskimos believe in spirits in habitating both animals and what we should term inanimate objects. The white spirit is called Tomassuk, and he rules over all the helping and guardian spirits, or tomat, of all of whom he disposes at will. His figure and power are not, however, definitely marked. The chief deity in connection with the food supply is an old woman who resides in the ocean, and is called Sedna among the Central Eskimos, and Amnagnoguk among the other divisions. She causes storms or withholds seals or other marine animals, if any of her tablets are infringed, her power over these animals arising from the fact that they are sections of her fingers cut off by her father at the time when she first took up her abode in the sea. It is this chief deity in the form of the shamans, or angakok, to discover who has infringed the tabus and thus brought down the wrath of the supernatural beings; and it is likewise his duty to compel the offender to make atonement by public confession of his deed. Among the Central Eskimos it is believed that two spirits reside in a man's body, one of whom stays with it when it dies and may temporarily enter the body of some child, who is then named after the departed spirit. Mother to other goes to one of the secret lands of the souls, some of which lie above, and some below, the surface of the earth.

According to the statements of Rink, the whole visitor is surrounded by guardian spirits, each of whom holds sway within certain limits, and is called inua ('man,' 'owner').

"Strictly speaking, scarcely any object existing either in a physical or spiritual point of view may not be conceived to have its own. Generally speaking, however, the notion of an "time is limited to a locally, or to the human qualities and passions, e.g., the issue of certain mountains or lakes, or strength, of eating," etc.

Perhaps the best idea of Eskimo religious beliefs can be obtained from Rasmussen's work mentioned above.

"We do not all understand the hidden things," one old man told him, "but we believe the people who say they do. We believe in the chief, but believe the magicians, the one who hunt would make themselves invisible to us; if we did not follow their advice, we should fall ill and die. We observe our customs, in order to hold the world up, for the powers must not be offended. We are afraid of the great Evil. When we are sick, the sick one is led to the priest. If a person is dead in each finger-joint) there resides a little soul, and, if a part of the man's body is sick, it is because the little soul has abandoned that part. The people believe that sickness results from wrong, as due to one of the following causes: either that evilly disposed persons may have been driven to make incantations, or that the higher powers, the moon, for instance, have removed it as a punishment for men's sins (some sacrilege, breach of taboo, or other)."

There can be no doubt that the native religion of the Eskimos is gradually becoming extinct, and in Western Greenland (as also in East Greenland) the Danish and Norwegian missionaries have put a stop to it. They sang drum-songs, I kept silent. I was ashamed. The doctor stayed in the house and I was a ready of a magician; but to the many I said nothing of it, for I was still very little of a

magician. Another time I started for the hill and lay down to sleep, and, as usual, I heard again the same song. One now began to speak to me, and asked me for a blade of wood. When I returned to men, I still did not speak about it, but carved a blade of wood for the spirit. The next time the hill-spirit was in my own house, and a great dog was running after me. I thought this dog, too, became more threatening only when many people fell sick that I revealed myself as a magician. . . . My helping spirits know my thoughts and my will, and they come to me, and I ask them for something."

Rasmussen himself thus sums up their religion:

"Their religious opinions do not lead them to any sort of worship of the supernatural, but consist—"they are to be formulated in a creed—of a list of commandments and rules of conduct controlling their relations with unknown forces hostile to man." (p. 125). "Their religion does not centre round any divinity who is worshipped, but vents itself in a belief in evil, in the spirit of the dead, which asserts that this he does by himself taking the dreaded forces into his service. For the magicians, who are the leaders of the people, can, by their arts and skill, make the powers who are masters of life and death subject to them, not by prayer but by command. . . ."

From these beliefs those of the Eskimos of Ammassalik, Fiord, East Greenland, differ in some noteworthy regards, as is detailed by Thalitzer ("The Hostile Priests of East Greenland," Internat. Amerikanisten-Kongress, Vienna, 1910, ii. 447-454):

"The Eskimo religion knows two supreme divinities: the moon, Animaq, which is regarded as a man, a hunter, who catches sea-animals, who has his house, his hunting grounds, and his implement of work in a small, no more of a woman of the name of drink, who procures rain by shaking a skin drenched in urine down upon the earth, so that a shower of drops is sprinkled upon it. Besides the angakok, the Greenland Eskimos have an inferior and less esteemed class of shamans, the qillalik, the most of whom are women. The language in which they speak is quite different from the Inuit language, in which the spirits is 'not sheer abracadabra, but obsolete or metaphorically used Eskimo words, a kind of inherited art language, which since the centurys of the native peoples, the customs, and the mystical character of the spiritual gathering. The religious forms or expressions themselves are used correctly in the form in which he is led by his spirits, or the manlike animals belonging to the sacred ritual, which enter the hut while the angakok's soul is still in his body, these being Tinersit, living in the interior of the country; Esquitniaid, dwelling under the ground close to men's huts; and Inuertorit, living on the banks under the rocks of the coast. Besides these there comes from the sea the 'consulted one,' Aperigt, who serves as the intermediary between the angakok and Torsertorit, a sea-monster which guides him to the woman of the sea, and informs the Aperigt (who then tells the angakok) as to what souls have asked to speak to man, whose behalf the consultation is made, and where they may be found; whereupon the attendant spirits are to search for and bring back the 'consulted soul' to you. For instance, if sickness occurs, all diseases are nothing but loss of soul; in every part of the human body, the soul is present; where it is lost (in each finger-joint) there resides a little soul, and, if a part of the man's body is sick, it is because the little soul has abandoned that part. The people believe that sickness results from wrong, as due to one of the following causes: either that evilly disposed persons may have been driven to make incantations, or that the higher powers, the moon, for instance, have removed it as a punishment for men's sins (some sacrilege, breach of taboo, or other)."
active; and in Alaska the Russians have labored for more than a century, with good success, for the Christianization of the Eskimos, their work being assisted by missionaries, and by educational institutions. Among the native groups, on the other hand, the native religion has remained practically untouched by missionary endeavour.

Taken all in all, Eskimo culture, despite a remarkable specialization in certain aspects of material civilization, shows sufficient fundamental similarities in all other aspects to warrant its inclusion in the cultural areas of North America. This is not only due to their relative geographic nearness, but also to the fact that they all shared a common tradition and influences from a common past. The Barrier Land and Hudson Bay (U.S. Nat. Hist., 1879) clearly show the importance of the barrier in the sense of isolation and development of Eskimo culture. The Barrier Land, being a part of the Arctic Ocean, and having an average temperature of -30°C, is a very cold and inhospitable place. This, coupled with the fact that the Barrier Land is relatively isolated from the rest of the world, has resulted in the development of a unique culture.

ESSENCE — The essence seeks the essential. Cognitive energy, from its first instinctive stirrings to its most highly developed and clearly conscious forms, is a process of selection impelled by deep-lying vital necessities. The essence is not an act of selection and elimination, reacting characteristically upon the multitudinous stimuli of the physical world. On the selected material they present, the mind carries out a further process of sifting and combination, in accordance with its immanent norms and ends. The whole discriminative and elaborative activity is vital self-expression of the mind. In biological terms, cognition may be described as a mode of the mind's vital adjustment to environment—an adjustment which selects the nature and at the same time subserves the realization and conservation of the self. In other words, cognition so far satisfies the primal need of personal life to maintain itself (cf. art. EPISODES). Thus, thinking and human activity in general are purposive through and through. Behind it all is the will to live, to be a self, to self-attainment, it may be pointed out, that the very ideas of truth and reality are possible only in relation to an interest or purpose. Apart from an informing aim to attain the true or to grasp the real, thinking or intelligence could have no intelligible relation to truth or reality.

As Stout puts it (in Personal Idealism, ed. Sturt, 1900, p. 10), "a person cannot be right or wrong without reference to some interest or purpose." Similarly, Joyce asserts that an idea appears in consciousness as having the significance of an act of will, and that the inner purpose is the primary and essential feature of an idea (The World and the Individual, 1st ser., New York, 1900, Intro., passion).

Thus, the world of matter furnishes the occasion and material for the progressive self-fulfillment of the Ego; or, put to it otherwise, it is the correlate of man's self-activity; and the essential in what is specially relevant to a particular interest or purpose of the mind at work on the organization of experience.

'The essence of a thing is that one of its properties which is no longer accidental to it, but which it acquires, as it were, or detaches from the rest: it may neglect the rest' (W. James, Text-Book of Psychology, 1902, p. 207). Or, "it is merely such aspects of the whole behavior of the organism that are selected from among the rest, by reason either of their relative permanence or of their importance for our purposes" (V. O. S. Schiller, Humanism, 1907, p. 225).

This fairly represents our ordinary workaday attitude towards things. It does not follow, however, that the things of sense-experience are absolutely plastic material. On the contrary, they exercise a certain control. They may be variously perceived, in this or in that combination. Our knowledge is the resulting discovery of unworkableness. In our practical intercourse with things we have to reckon with certain invariable modes of action and reaction; and these constitute for us their essential characteristics or nature (cf. G. Jacoby, Pragmatismus, 1909, p. 33). Science represents a systematized and critical form of the common-sense view of the world. Armed with its weapons of precision, it stands for enhanced mastery over Nature, for enlarged human efficiency. It is this quality of exactitude, expressed in measurement, that distinguishes scientific procedure most sharply from the rough and ready methods of common sense. The constant endeavor to attain the maximum of accuracy, order, connection, consistency, and completeness in the different provinces of knowledge makes science necessarily critical of the looseness and incoherence of ordinary thinking, and is apt to beget the impression that the scientific attitude is antithetic to that of the practical man (see, e.g., J. Arthur Thomson, Introd. to Science, London, 1911, p. 38.). Nevertheless, in spite of this irreconcilable contrast, it is best described as a critical development of common sense. The further organization of experience is due to the working of the same organic impulse of self-realization, with the addition of active interests, which makes the synthesis of knowledge possible at all. It is very generally recognized that at all events the physical and natural sciences aim at 'the description of events by the aid of the fewest and simplest general formulae' (ib. p. 47); they limit themselves to descriptive formulation in contradistinction to explanatory interpretation.

This phenomenalism of method is self-imposed in the interests of the special disciplines and of science as a whole. In order to deal with the facts of experience in their immeasurable complexity, certain aspects must be mentally isolated and fixed, and the whole body of relative data envisaged from this point of view. Thus, the particular sciences carry through methodically the abstraction which is the other side of all intellectual concentration. They are systems of intellectually attacking and mastering an otherwise unmanageable mass of experimental material. The same group of facts may be worked over by many sciences from their own distinctive viewpoints, yielding to each the special concepts, classifications, and laws. Merz, in his monumental History of European Thought in the Nineteenth Century (1896-1903), regards the various lines of scientific advance as characteristic modes of viewing Nature, and classifies them accordingly as the astronomical, the atomic, the mechanical or kinetic, the physical, the morphological, the genetic, the vitalistic, the psycho-physical, and the statistical views of Nature.

Clearly, then, it is not the business of the sciences to determine the real essence of their subject-matter. The very notion lies outside their purview. For this reason it is grossly fallacious to construe this methodological ignorance as metaphysical negation. It is impossible to negate what is not considered; it is impossible to answer a question which is never raised. Empirical science is no more anti-metaphysical because it ignores the metaphysical than geometry is anti-biological because it does not concern itself with the phenomena of life. On the other hand, the empirical sciences contribute valuable and indispensable material for the solution of the strictly philosophical problems.

Science does not, in point of fact, satisfy the
irresponsible demand for real explanation. A pure scientist has never lived. Philosophy recognizes that the questions regarding ultimate explanations and conclusions, and eternal values, must be faced. It recognizes, further, the inherent limitations and instrumental character of scientific method, and perceives that it is but a partial explanation of the supposed ultimate, and that one phase in the total life of the human spirit. Philosophy represents a resolute endeavour after completeness in thought. It seeks to take cognizance of all the facts and factors that enter into human experience, and hence does not limit itself to facts amenable to ordinary scientific treatment, or assume as ultimate and finally valid the working principles and underlying assumptions of the sciences. The particular sciences and science as a whole form part of its total datum, which embraces the whole range of human culture, both as result and as process. This huge aggregate—as it at first sight appears—must somehow be conceived as a whole, and to this end the facts must be graded according to their causative efficacy and explanatory value. The result is an ultimate synthesis, on the basis of a thoroughgoing and comprehensive constitution and complex into its constituent factors and ends. Not, of course, that the philosopher is bound to consider his view of the world as an adequate intellectual formulation of ultimate reality; the fact that the life which energizes in the thinker is in continuous movement and development should be enough to hold him back from the presumption of absolutist gnosticism. Yet this admission does not carry with it the admission of relativism, the philosophy cannot help believing that, though he has not grasped and cannot grasp the whole truth, he has, nevertheless, reached essential truth, that permanent validity attaches to the substance at least of his central affirmations, and that his efforts will make for a fuller apprehension of the truth by future generations. To claim less than this would mean an intellectual self-renunciation tantamount to suicide. In its metaphysical insinuation philosophy expresses the outreach of man in one direction of the spiritual life—a reality wider and deeper than mere thought—towards self-realisation. The essential is an ideal to be realized; it is also a substance of reality, impelling and attractive; or it would not be sought. Only that which is in some sort our own moves us. Essence in its large signification is the all-comprehensive problem of human philosophy, and hence of practical philosophy. Its solution will not be furnished by the subtlest reflections of the theoretical reason, but by the forward movement of life as a whole, by the active realization and explication of a truth of humanity which is vastly more than any theory (see B. Eucken, Geistige Strömungen d. Gegenwart, 1909, p. 361 f.). The problems are internal and vital, and are progressively resolved by the self-unfolding of the vital process, which they have challenged and stimulated.

Literature.—On the part the term and concept have played in the history of philosophy, see Eisele, Wörterbuch der Philosophie, Begriffe, 1904, art. 'Wesen.' For Greek philosophy, see the Histories of Philosophy by Zeller, Erdmann, and Überweg, Heine, good accounts of Scholastic usage are given in T. Harper, The Metaphysics of the School, 1878-84, vol. 1, bk. ii, and E. H.判定, Käntische Schriften, Schopenhauer series, esp. those on Logic (Glaire), First Principles (John Rickaby), General Metaphysics (Do.) For modern times, see the following may be consulted: Locke, Essay on Human Understanding, bk. iii; J. E. R. Tiles, On the Principles of Material and Moral Science, 1884; J. F. Ferrer, Institute of Metaphysics, 1894; J. Helg, Spathophilosophie, 1848; 'Lehre vom Wesen' (ct. W. Windelband); Losseau, Log of Hegel, 1877; v. Loetz, Metaphysics, Eng. tr. 1884, passim, and Microcosmos, Eng. tr. 1868, vol. ii, bk. ix, by G. T. Ladd, Theory of Reality, 1892; F. B. Windelband, History of Philosophy, 1890. For the suggestive development of the idea of essence is given by B. Eucken, Geschichte der Philosophie, 1899, esp. in many vols., e.g., Grundriss einer neuen Lebensanschauung, 1897, pp. 174 f. and 259 f. (cf. J. Goldstein, Wanderungen in der Philosophie, 1891). It is not, however, the same kinds or 'essence' is given by Mallon, Introd. Text-Book of Logic, 1898.

W. F. DUNLOP.

ESSENES.—The Epulones of Artemis at Ephesus were called 'Essenes' (Pauw, viii. 13: οὕς ἕως ἔννοιαν μὴ ἔχειν, καλαμπόνθες δὲ τόν τῶν ἑαυτῶν μηδενόν οἴῳ τις'), but the name is specially applied to a remarkable pre-Christian order of Jewish monks, whom Josephus calls Barrew or Barwell. Philo adheres to the latter name, which, as more Semitic, was probably the original formation of their title.

1. Sources of Information.—Neither the Bible nor the Rabbinical literature mentions the Essenes, but their mode of life is described by (a) Jewish, (b) Christian, and (c) pagan writers.

(a) Philo and Josephus devote unusual attention to their customs; and as the former was a contemporary, while the latter spent three years in their neighbourhoood, the latter's account of gaining acquaintance with individual Essenes, the narratives of both writers, although liable to qualifying criticism on the score of tendency, furnish indispensable materials for an estimate of the order.

(i.) Two Philonic statements are extant. The first and longer occurs in the treatise, Quod omnis probus fiber (§§ 12-13), a youthful work, perhaps written while Philo was still a student. He has just been proving that the world is not wholly destitute of virtuous people; after pointing to the Persian Magi and the Indian gymnosophists, he proceeds to quote a salient example from his own countrymen:

§ 12. 'Nor are Palestines and Syrian barrens of moral excellence (καλακεία)—countries inhabited by a large portion of that most populous race, the Jews. There are among them people called Essenes, numbering over 4000, and in my judgment so called from their priest γενέσεως—though the derivation is not strictly Greek—since they are pre-eminently worshipful servants of God (παρακτημένων: they do not sacrifice animals, but only to keep their minds pure) and are at the same time the worthy servants of the lawless multitude of them (παρακτητηρίς). In the first place, they reside in villages, shunning town-life or any departure from the harmless shores of holy and godly living. Others practise such acts and crafts as are consonant (ευπρόσωπος) with saving the peace, and thereby becoming the benefactors of their neighbours. They do not treasure silver and gold, nor do they acquire large tracts of land in an eager desire for income, but only to provide the assurance for the absolute necessities of life. They are almost the only people who remain destitute of money and possessions, by use and woe rather than by any lack of prosperity; yet they are esteemed wealthy, for they consider that to be frugal and contented, as indeed it is, ample abundance. You would not discover among them any maker of arrows, spears, swords, helmets, corslets, or shields, any maker of arms or war-engines, any one housed in the slightest with military avocation or even with those which, during peace, slip easily over into mischief; they are totally ignorant of trade and commerce and uncertain, abhorring, as they do, all inducements to covetous gain. There is not a single slave among them; all are free and exchange kind offices with each other. They condemn the position of master, not only as unjust, being a breach of equality, but as impious, since it violates the contract of Mother Nature, which gives birth to all and alike and rears them as genuine brothers, not as comunal, whereas crafts and gains are everywhere despised and despises by its desire to obtain others, it engenders hostility instead of affection, and enmity instead of friendship.'

Logick is a definite science, which by which they leave to word-catchers, as unnecessary for the acquiring of virtue; physical science they regard as too lofty for human nature, and so they

1 Schreiber, omitting κατα, confines the Essenes to Palestine and Syria. They were not the only people who lived in such a manner; but, according to the author, the Essenes were the most eminent, and, in consequence, the most famous. There was, however, a difference between the Essenes, and those who were called Essenes, which is not apparent in the original. Nor trace of Essenic propaganda is to be found in Asia Minor or Italy.

2 Hippolytus (Harv. lx. 21) adds that some carried their religious object to idolatry so far that they refused to use coins, and even went so far as to fast until they passed below statues at the gate (cf. E.R.E. iv. 849).
The Essenes were a Jewish sect that lived in the desert, away from the temple in Jerusalem. They believed in a strict form of monotheism and practiced asceticism, rejecting material possessions and following a rigorous code of conduct. Their community was centered around a central figure, the High Priest, who was considered to be the representative of the Deity on earth. The Essenes believed in the idea of a perfect society, which they sought to create through their own actions and through their influence on others.

Their life was guided by a strict code of conduct, which included a ban on marriage and the accumulation of wealth. They believed that the accumulation of wealth and material possessions was the root of evil and corruption, and they sought to create a society in which justice and virtue were the guiding principles.

The Essenes were known for their strict discipline and for their role in the transmission of the ancient Jewish texts. They were believed to be the custodians of the Law, and they were responsible for the preservation of the Torah and other sacred texts.

Their community was divided into two main groups: the scribes and the warriors. The scribes were responsible for the study and preservation of the Law, while the warriors were responsible for the defense of the community.

The Essenes believed that the end of the world was near, and they prepared for it by living a life of asceticism and by preparing for battle. They were known for their strict discipline and for their role in the transmission of the ancient Jewish texts. Their influence was felt throughout the Jewish community, and their ideas continue to be studied and debated by scholars today.
ESSENES

Although they do not repudiate marriage with its function of continuing the race, they shun the licentiousness of women, and keep close to their house, and to a man.

§ 2. They despise wealth, and their socialism is remarkable; you cannot find any of their books or buildings that are worth more than his fellows.

The rule is that all who enter the sect must divide their property among the common body, so that there is not a trace among its members of part and parcel, of which they say the wealth; the distribution of every one's possessions creates, as it were, a common property that is not divided, and, if any one is involuntarily smeared, he wipes his body clean; to be uncleaned (ανέκστείσηται) and always to wear white clothing. Nothing is wasted which is the stock management of their common property, whose sole business it is to look after the whole of it. They are not afraid to make them adopt, in order to save them from unbalanced gain; never to keep any secret from their fellow-members or to betray any of their secrets to other people—no, not even under threat of death. He swears, moreover, to communicate their principles precisely as he himself has received them, to abstain from origamie, and to follow with like care the sacred books of the society and the names of the angels. Such are the oaths by which they make sure of their mutual faith.

§ 8. They expel any members found guilty of heinous sins, and the expelled person often persuades another for him. But at the bond of his oaths and habits he is prevented from receiving food at the hands of other people, so that, refused to eating and drinking, he languishes under starvation and privations. Hence, out of compassion, they take many a man back when he is at his last gasp, considering that he has been sufficiently punished for his sins by being thus brought to the verge of death.

The Essenes were strictly religious and in the matter of abstaining from forbidden things: no sentence is passed by a court which is less than a hundred years. A man who swears falsely to God the name of his legislator is highly revered, and the punishment for any blasphemy of him is death. They obey their elders for three years before entering in the sect, and when they have kept the rules for three years they return home to Him as the God of the life of (παντοκράτορας), and pass before one another to keep the seals before them in order (σταυρομετρία), while the cook sets before each a plate containing one kind of food. But no one is allowed to take a prayer, and at once, when they have breakfasted (reading with Porphyry ἡ σεβαστή ἁυμος νοστία) they then sit in session, no one else staying in the apartment. Then, after a prayer and silence the eschem, splitting 2 in front of them or on the right side, and avoid work on the seventh day more strictly than any other Jews.

The workmen are divided into four classes, according to the length of their service, and the juniors are so inferior to the seniors that, should the latter be touched by the former, they wash themselves as if they had been sullied by contact with a foreigner. They are long-lived, many of them reaching the age of a hundred—thanks, I suppose, to their simple diet and regular habits; but they despise the life of leisure.

Their spirit enables them to retain a superior to pain, with glory, is preferred to length of days (ἀπέραστη ζωή).

The Roman 3 showed what great souls they all had; for though racked by the persecution of the proselytes, and to every instrument of torture, to make them blaspheme their legislator or cast the hidden food, they preserved their silence. A word of theirs is stronger than an oath; they shun swearing, which they consider to be a trifling and a profane thing. Hence, when no other Divine oath to accrude it is condemned already (οὐκ ἐπεσταλεῖται). They also take exceptional pains to select from the writings of the ancients (οὔτὶ ἐποίησεν ἐγγεγράμμην) what is good for soul and body, which leads them to discover medicinal roots and stones which have the property of curing ailments (cf. ERE iv. 757).

If any one is eager to join their sect, he is not admitted at once. He is given a spade, a girdle (vomiting, with Porphyry ἐκτιμάται, and a white robe, and ordered to practise their mode of life for a whole year, remaining still an outsider.

After thus giving proof of his continuance, he gets closer to their way of living, and shares their bath of purification, though still often being reproached. The evidence of endurance 4 is followed by a further period of probation, lasting between five and ten years, unless the candidate is enrolled in their band. But, before touching their common things, he takes four oaths: first of all to be pious to the deity; then to destroy wealth; then to destroy their common oaths. They are done correctly in the word and in the mouth, and they take any one either of his oaths or condition; always to hate the wicked; and they regard as wicked, show disfavour to all men, and particularly to those in authority, since no one acquires power apart from God; never, if he be in power himself, to take any power, which he has in his power to ordain in dress or finery: always to love the truth and denote harm to the public, and keep his hands clean, and to see to it that he is not defiled by unearned gain; never to keep any secret from his fellow-members or to betray any of their secrets to other people—no, not even under threat of death. He swears, moreover, to communicate their principles precisely as he himself has received them, to abstain from origamie, and to follow with like care the sacred books of the society and the names of the angels. Such are the oaths by which they make sure of their mutual faith.

1 Possibly this was an anticipation of the Gnostic prophecy 
2 It is not quite clear that these meals were sacramental in the sense of the term, or equivalent to the eucharist, which the Essenes required after part, although they partook of the meal in 
3 The Roman 3 showed what great souls they all had; for though racked by the persecution of the proselytes, and to every instrument of torture, to make them blaspheme their legislator or cast the hidden food, they preserved their silence. 1. That is, from the delusion of sin, more searching (σκυφηφαρμος) than the signs of death. I. Conybeare, Histoireprospérées des Grecs, Göttingen, 1807, p. 233.
2. Cfr. ERE 2, 255.
3. Every bright thing' in Ec 124 was interpreted by R. Samuel (3rd cent. a.D.) as referring to a man spitting in the presence of his ruler. It is similarly interpreted by the Septuagint (σαβιος).
5. This is one of the practices which suggest the influence of the Indian caste-system. So an Indian Brahman is polluted by the touch of the unclean, as the sight of a woman is profane (Conybeare, HDBI 729).
6. In this sense, according to John (R II ii. 44), took an active part, according to their peaceful principles forlorn warfare. For an analogous instance of patriotism overbearing such principles, Cfr. Holtzmann (ZDMG i. 23) erroneously assigns to the action of the Mennonites and some Quakers in the American Civil War.
7. For the conception of Immortality apart from the resurrection in the body of Hellenistic Judaism, see Wits. i. 44.45, 54, Mac etc. (Jerome, Eus. iv. 4).
that good souls dwell beyond the Ocean, in a land unvexed by rain or heat (possibly by frost too, suggested by the gentle breath of the West wind blowing steadily from the Ocean); to bad souls they allot a gloomy, stormy den, full of pestilence, and no resting-place. Some persons identify "the consoling of the wicked to the abode of the impious in Hades, where people like Sisyphus, Tantalus, Iason, and Titus are being punished, eating and drinking forever." In the first place, that souls are eternal, and, in the second place, that punishment be separated from vice and promptness to virtue. For the good are supposed to believe better if they can hope for reward even after death, while the impositions of the vicious are characterized as "the most extreme and everlasting punishment after their decease, even if they escape notice in the present life." Such is the Essenes' theology of the soul, and it exercises an irresistible fascination over those who have once tasted their philosophy (ὸς ἔχει γενόμενον τῆς σοφίας σύννεφος) of life.

On the other hand, some of them also undertake to predict the future, by perusing the stars, or by performing various acts of purification (πυρόσια) and by digesting prophetic oracles. Rarely, if ever, are their forecasts wrong (cf. 2 Macc. iv. 5061). 3

13. There is also another order of Essenes, who share the life, habits, and customs of the others, but take a different view of marriage. They argue that celibates excite the function of life, which is to perpetuate the race, and that, if everybody declined to marry, the race would soon cease to exist (wrestling, with testament. For the law allows for the marriage of more than one wife, and the people may be assigned their power to conceive. These Essenes have no intercourse with their wives during pregnancy, showing that they marry for the sake of posterity and not for pleasure. They bathe the women, wear gowns, and the men drawers. Such are the customs of the Essenes.

In Ant. XVIII. 5 also Josephus gives a brief outline of the doctrine of the Essenes, which has only three distinctive items: (1) the remark that, in setting their dwelling to the temple at Jerealem, they do not offer the usual sacrifices, since, in their opinion, they have superior lustrations (δαπανηταί δαπανας), and that this refusal excludes them from the common sacrifices (τις ἑσσήν χρηματάτος) of the Temple, as ceremonially defiled persons; (2) the description of their relieving officers as 'good priests'; and (3) the comparison of them to the Dace who are called Polies (Πολιες), cf. Strabo, viii. 362.

(b) The Christian references are all later, and, for the most part, of little independent value. Ephiphanius (Hier. xix. 1-2, xx. 3, xxx. 3, etc.), who appears to name them 'Essenes,' describes how he calls a surviving remnant of them in the Sampranians, or sun-worshippers, a sect among the infidels of Eastern Christianity, who occupied the ancient Samaria, and occupied the holy city of Esse. Hippolytus preserves or records two more credible items of information (Hier. 14-23), particularly the fact (which is, on other grounds, probable) that some Essenes identified themselves with the active methods of the Zealots and the Sicarii. But both Hippolytus and Porphyry (de Astat. iv. 11-13) go back, in the main, to the former account of Josephus.

(c) A solitary notice occurs in Latin literature, which is interesting rather than important. Pliny (HN v. 17), after describing the Dead Sea, continues:

'On the West side of the Essenes avoid the bald lake shoreline. They are a race by themselves, more remarkable than any other in the wide world; they have no women, they affect social love, they have no money, and they live among palm-trees. Still their membership (futurum communem) is steadily recruited from the large number of people who resort to the holy city of existence because they are wearied of life's struggle with the waves of adversity. Hence they lived (it is said) for thousands of ages, though no one is born within it; so fruitful both in the dissatisfaction with life (tela pereatitia) which others feel. They live by the town of Engedi, second only to Jerusalem in fertility and palm-groves, now simply a second city to a rock-girt of Masada, which also is not far from the Dead Sea.'

2. Characteristics.—The above sources, upon the whole, confirm and supplement one another. Repeated attempts have been made to determine the true one or both of the Philonic passages (e.g. by Ausfeld, Ohle, and Hilgenfeld), but their authenticity may be considered to be established (cf. Treplin's special essay in SK, 1900, pp. 28-31, and the argument of Poujou, in Thoel. Studies, 1905, p. 230 ff.). 2 When De Quincey first read the narrative of Josephus, he leant back in his chair and denounced the tale as 'a lie, a fraudulent lie, a malicious lie' (Works, vi. 275). Others before him and after him, with better reason, have suspected the Essene paragraphs of the Jewish historian (notably Ohle, in JTh, 1888, pp. 221 ff., 336 ff.); but their suspicions have failed to make any serious impression. The sources must be accepted as coming from Philo and Josephus. It is another question, however, whether they are trustworthy in every detail. Essenes may colour their quotation from Hoi, but in Philo, it is probable that Philo, or the latter, have led him to arrange the figure of the Essenes for his picture in the Quad omnis probus liber, just as Josephus is likely to have read into the beliefs and customs of the Essenes an order a slightly more than was actually present. Thus it is noticeable that Philo, for example, omits any reference to the presence of Essenes in the cities of Palestine; his aim is to bring out their semi-monastic existence. The ordinary impression of the Essenes is, indeed, that they were a community of celibate recluse; Newman's lines,

'Now knout in unction rest,
The mood of an Essene (Etrae Atalotca, etc.),
indicate the popular estimate of these Jewish monks. But, while the sources corroborate this general verdict, they also attest, as we have already seen, the existence and activity of certain Essenes outside the pale of the strict settlements. Josephus, who assigns their rise to the 2nd cent. B.C. (Ant. XIII. v. 8-9), tells an anecdote which proves incidentally that in the beginning of the next century there were Essenes who did not lead city-life and did not reside permanently in retired, monastic communities. It is a twice-told tale (BJ i. 35.—Ant. i. 2) of how the murder of Antigonus was foretold by Judas the Essene, who had never made a mistake or been deceived hitherto in his predictions. He saw Antigonus passing through the temple (τα τα κατφταναι και ἐστατὸν ζωμον) and called out to his friends, a number of whom were sitting beside him to receive instruction (παράτατον; 'Abi I had better die now, since truth has died before me': these were the words of the old man. If the spirits were downcast and remained so. Shortly afterwards, however, word came that Antigonus had perished in a submarine place, which is called 'Cesarea on the summit of the tower. It was this identity of names which disappointed the seer.'

In Jerusalem, therefore, as well as in the other townships of Palestine, Essenes were to be found, no doubt preserving their close brotherhood, but still not wholly detached from the interests of the larger world. Another Essene, called Andrew, exercised his prophetic gifts in a more auspicious fashion: by saluting a schoolboy as king of the
Jews, and predicting his royal career. When the schoolboy succeeded to the throne as Herod the Great, he remembered Menahem, and for his sake honoured the order of the Essenes (Ant. xv. x. 5). Later Herodes the Great, who was actually of the Essenes, held him in high esteem, as well as to forcert its course. The Jewish war saw at least one Essene heading the rebels, and others in the ardent ranks of the Scearit and the Zealots. Still, the independence of the individuals must have been recognized by the disciplina arcana and the close socialistic union which bound an Essene for life to his fellows. Banni, the anchorite with whom Josephus spent three years, lived in the vicinity of the Essenes, but the Essenes were not lonely anchorites. Even in the cities they hung together. A closely knit system of mutual support prevented them from becoming exposed to the temptations of trade, on the one hand, and of a solitary reclus existence, on the other.

The probability is, therefore, that the Essenes were a set of small, communistic, religious groups on the shores of the Dead Sea. While their nucleus was forming a club to their existence, they beyond and even within their membership there were grades—not simply novices and initiates, priests and lay brothers, but even some who practised marriage in a fashion and abroad, in cities where the agricultural life was impossible. It is evident that some Essenes were in the habit of travelling within certain limits, and we can only conjecture the object of their journeys; as it could hardly be trade, it probably was connected with the business of the order—possibly with the promulgation of their tenets and propaganda in a mild way, in order to recruit their ranks. It is psychologically impossible and psychologically unnecessary to assume that Essenicism passed from a looser to a closer bond, or vice versa. Both phases existed simultaneously, and their relative importance depended upon the special conditions of the age. We cannot speak either of a gradual withdrawal from society or of a gradual expansion of interest, on the part of some Essenes, in the world beyond their farms and settlements.

A perusal of the sources will give a more vivid idea of the general characteristics of the Essenes than any summary. Through the windows of Philo and Josephus and Pliny—for they are not too much coloured to be fairly transparent—we can look at this little brotherhood of 4000 souls, a league of virtue, with their agricultural settlements, their quaint, semi-asetic practices, their strict novitiates, their silent meals, their white robe, their habits, their prayers, their simple but stringent socialism, their sacerdotal puritanism, their soothsaying, their passion for the mystical world of angels, their indifference to Messianic and nationalistic hopes, their esoteric beliefs, and their approximation to sacramental religion. If the modern student only knew their genesis and exodus as well as he does their numbers, he would be satisfied; but they appear and disappear in a mist, leaving little semblance of a Christian order. None of their sacred books has survived—that is, if these included, as they probably did, more than the books of Moses. We do not even know whether they were written in Greek or Aramaic. By the time that the Rabbis reached the Christian literature arose, the literature, and almost the very name, of the Essenes had vanished from the Eastern world. It is thus impossible to approach them with any clearness through the Christian tradition. De Quincey, indeed, once wrote an essay to prove that the Essenes were Christians organized in a secret society for the purpose of self-preservation; but his essay belongs to English literature, not to historical or esoteric history and attempts were made to trace the affinities of the Essenes with the early Christians, and to discover the influence of the former in the ascetic tendencies, the ascetic labours of the early Christians, the common meals of the primitive Churches. But the day for such labours of criticism is over; it is no longer necessary to prove that Jesus was not an Essene, and that early Christianity was not Essenic. Even in the errors combated in the Epistle to the Colossians it is hardly possible (cf. Hort, Judaistic Christianity, 1894, p. 128) to detect any specifically Essenic features. It is only through later and inferior traditions that we can surmise the existence of Essenic survivors among the medley of the sects who swarmed within the pale of Eastern Christianity after the fall of Jerusalem. 1 They become less obscure as they are approached and the virtues of Essenic belief and praxis can be seen as their sources in contemporary Judaism.

The Essenes have been called 'the great enigma of Hebrew history,' and the enigma begins with their very name, which appears in another, apparently more ancient source. The second, advanced by Lightfoot, C. Taylor (Sayings of the Jewish Fathers, 1897, p. 79), and E. Mittwoch (in ZA xxvii. 1903 75 f.), is more probable, just as the second (favored by Lensus, Essenes, and Schiller) is more likely than the fourth (Bair, Derenbourg, Keim, etc.), which would single out an isolated trait as distinctive of the order. In any case they were a raga of Judaism. Even their loose relation to the Temple-cultus does not invalidate this primary fact. But, if they are an enigma of Hebrew history, they are an insoluble enigma, unless we look beyond the confines of Judaism. The Jewish traits of the Essenes, especially their rigorous care for purity, their reverence for the Mosaic law, and their strict sabbatarianism, certainly ally them with the Pharisees rather than with the Sadducees. Their passion for an ascetic, simple life, and their aversion from most of Greek civilization in the cities, might seem to stamp them as descendants or revivers of a movement like that of the Rechabites (cf. EZE ii. 68, 69); but against this we must set their age, their age, their age of marriage, their tolerance of wine and agriculture, and their unmornadic attitude to fixed dwellings. Essenicism was not hereditary. It was a fever, in the sense of a gild or corporation, not established in the sense of the older Rechabite clan. Its ranks were recruited from without, like a monastic brotherhood, and its ascetic practices were different from those of the Rechabites. Although parallels with many separate details of Essenic belief may be found in Rabbinic literature, 2 the synthesis of these on Jewish soil is a phenomenon by itself, and—in spite of the efforts made by Jewish and Christian (e.g. Baur, Lichten, and Schiller) 3 to find elements which point to a Palestinian syncretism enriched from some foreign and possibly Oriental sources.

The Essenes, as Josephus admits, were ἔχθροι within Judaism; they took their own way of life and worship. They were more than ultra-Phari-
sale, or Hasidism (Kohler, Weinstein, etc.), for the latter were not organized in separate communities (ERE I. 98). Their election of their own priests, their avoidance of returning to the sun, their practice of adopting children, and the distrust of matter which appears in their dualistic anthropology (‘To be set free from matter was the greatest of all desires’), and the Essenic ‘[1394] ... are among the plainest indications that we have to do with influences which were originally non-Jewish. It was only natural that the remark of Josephus (Ant. x. 259f.) about those preserving the same customs of life as the Pythagoreans should be developed by those who, like Zeller especially (cf. ZWT, 1899, p. 195f., ‘Zur Vergleichung des Christenthums: Essener und Orphiker’), fix attention upon their invocation of the sun, their prohibition of oaths, their doctrine of the soul, their communism, their aversion to animal sacrifices, and similar features, which recall Pythagorean and Orphic traits. But some of these were not distinctly Pythagorean, and the Essenes lacked other features (e.g. vegetarianism, and a belief in the journey of the soul after death) which were characteristic of the Pythagorean and Orphic faith. That Essenes were influenced directly or indirectly from the infiltration of the Pythagorean and Orphic spirit, much less from Zoroastrianism (Lightfoot, Cheyne; cf. ERE I. 110f.), for asceticism at any rate, was not so fervent, and none of the alleged parallels is particularly striking by itself (cf. Moultou, in HDB iv. 992). Hellenistic influence may be sought in other directions (cf. Ess. Ti. Ess. I. 15. 2, Friedländer, Pfleiderer, Hoenenick, Conybeare); for although Philo and Josephus presented practical and speculative Essenes in semi-Hellenistic colours, they were probably doing no more than deeper features of an Egyptian Hellenism which was already present in the order. At the same time, it is not improbable that some weight should be assigned also to the conjecture (which Higlenfield eventually abandoned, but which is being revived at the present day in several quarters) that Buddhist tendencies helped to shape some of the Essenic characteristics as well as some of those in 2nd cent. Gnosticism. The discussion of this hypothesis, however, must be reserved for another place.

ETERNITY.—1. Meaning of the conception.

There are three main senses in which ‘eternity’ may be understood: (1) as an unending extent of time; (2) as that which is entirely timeless; (3) as that which includes time, but somehow also transcends it. The first of these is the popular meaning of the term. In ordinary discourse, when people speak of passing from time to eternity, they appear, in general, to imply nothing more than the transition from a state in which special objects of interest (such as human personalities) have only a limited duration to a state in which they may be supposed to persist for ever. This sense of the term is also to be found, sometimes in philosophical writings. The eternal process, for instance, which Kant conceives to be necessary for the realization of the moral ideal can be considered as a process that is to be carried on without end. It is generally recognized in philosophy that such a conception has no positive significance. Kant, for instance, did not consider the moral ideal to be realized by the process of the realization of the moral ideal contains no real solution of the difficulties involved in the conception of that realization; and he accordingly supplements it by the idea of a divine point of view, from which the unending process appears as a timeless attainment of the end to which it points. But he does not show how this idea is to be reconciled with the conception of an endless process. On the whole, however, it may be fairly stated that the conception of eternity which has prevailed throughout the history of philosophy is not that of an unending process, but that of a state of existence which is completely independent of temporal conditions. Such a conception is that to which the mind is most naturally driven as soon as the difficulties involved in the idea of an unending process have been fully brought home to it; and it is a conception that is strongly supported by the apparent timelessness of those ‘laws’ and other general statements with which science and philosophy are largely concerned. The fact (or apparent fact) that these laws hold forever leads very naturally to the view that there may also be such a thing as timeless existence. It soon appears, however, that all the existing knowledge to us in the ordinary way is consistent with temporal conditions; and a little reflection is enough to convince most people that no timeless existence is even conceivable under the ordinary conditions of our conscious experience. Hence the conception of timeless existence leads inevitably to some such distinction as that of Kant between phenomena and nomens, appearance and reality, the sensible and the intelligible world, or however else the antithesis may be expressed. But the history of philosophy shows quite conclusively that, if any such antithesis is pressed, it becomes impossible to understand any connexion between the two modes of being that are thus opposed; so that, in the end, the opposition comes to be one between the intelligible and the sensible, but between the intelligible and the unintelligible, or rather between those terms which are in truth both alike unintelligible. If we are to avoid such a result as this, it seems necessary to interpret ‘eternity’ in the third of the three senses to which we have referred, i.e. to regard it not as the mere negation of time con-
ditions, but as continuing those conditions within itself, though in a form in which their limitations are transcended. It will be our object in this article to indicate briefly how such a conception of eternity is possible. But we must first give a glance at a number of difficulties which have been brought out, in connexion with this problem, in the course of the development of philosophy.

2. Difficulties connected with the conception, and attempts to solve them—Kant is undoubtedly the writer who did more than any other to make the difficulties in connexion with the ideas of time and eternity prominent and clear; and it is accordingly to his views that we intend chiefly to refer. But the significance of his work cannot be properly understood without reference to at least a few of his predecessors, among whom Parmenides, Plato, and Spinoza seem specially important in connexion with this particular problem. Valuable contributions have been made to the subject by some of the recent followers of Hegel, among whom T. H. Green, F. H. Bradley, Josiah Royce, and J. M. E. McTaggart are perhaps especially deserving of attention. From the different point of view, the work of Henri Bergson contains valuable suggestions. After noticing what has been done by these writers, it will be possible to sum up the conclusions to which the discussion of the subject seems to point.

Of Parmenides it is not necessary to say much. He is important only as showing how the difficulties of the problem present themselves at the beginnings of speculative inquiry. Unfortunately, there is still the possibility of considerable difference of view with regard to the exact meaning of his most important utterances; but there cannot be much disagreement about the general direction of his influence on the development of philosophic thought. It seems clear, at least, that he affirmed the eternal and unchangeable reality of being, as it is conceived by pure thought (or reached by the 'Way of Truth'), as against the uncertain and fluctuating appearance of that which is the subject-matter of opinion. Zeno appears to have further emphasized this aspect of the teaching of Parmenides, by urging the self-contradictions into which we fall when we try to think definitely of change as a motion from point to point in space, taking place from moment to moment in time. Much of the other chief followers of Parmenides, it would seem, have brought out still more explicitly the eternity of that which really exists, turning the poetry of Parmenides into plain prose, but perhaps, in so doing, approaching somewhat more nearly to the conception of eternity as an endless duration, rather than as that which is in its essence timeless. There is no evidence, however, that any of these members of the Eleatic school made any real attempt to explain the apparent changes in the world of our ordinary experience, on the supposition that ultimate reality is unalterable and free from time conditions. Like most of the early Greek thinkers, they were content to set the real in opposition to the illusion of time, without bringing the object of clear thought in opposition to the deception of the senses, without reflecting that even what only appears to us must have some kind of reality, or at least some reality, as long as we recognize that it was any part of their problem to explain the precise relation between the absolutely real and this spurious appearance.

Of Plato, it is necessary to believe, who first definitely recognized that some account has to be given of appearance as well as of the ultimately real. His conception of the ultimately real, like that of Parmenides (by whom he undoubtedly very greatly indebted), is the conception of that which exists eternally. More definitely than in the case of Parmenides, this conception is based primarily upon the eternity of universal truths, such as those of geometry or ethics. But what is specially noticeable here is the attempt that is made by Plato to give a place in his system to the teaching of Parmenides as well as to the truths that have been brought out, in connexion with this problem, in the course of the development of philosophy.
is any such positive idea at all—is in its essence Spinozistic. It is the idea of a reality undeter-
mined by the limits of our ordinary experience, and hence, in particular, undetermined by any conditions of time. But the strength of Kant, like that of Zeno, lies not in the unfolding of any positive conception of such reality,—which, indeed, like the limitations of the finite, do not work out this way, but in the thoroughness with which he brings out the difficulties involved in the thought of any kind of reality that is subject to change in time. In order to realize the significance of his work, it is neces-
sary to state his main points in his own contention, though they must be stated here with the utmost possible brevity. In stating these points, the present writer will express them in his own language, though endeavouring to include nothing that is not really contained in Kant's argument.

The first point that seems essential in Kant's argument is the contention that Time is simply the form of change, not anything that can be regarded as in itself substantial. Kant has a somewhat peculiar way of expressing this, which it is not necessary for us to consider here. He calls Time the form of the flow of time, or the nature of perception rather than of conception. All this is extremely questionable, and does not seem to affect the central part of his argument. The whole point is that this Time is to be regarded as a certain order—an order which may be most simply characterized as being of such a kind that its antecedent parts pass out of being as the suc-
ceeding parts come into being.

The next important point is that such an order as this cannot be regarded as ultimately real. Here, again, Kant's argument is somewhat complicated by modes of statement that are open to question. What is essential seems to be the contention that the order involved in time pre-supposes either a first member in the series of events or an unending extent in the antecedent members of that series. Neither of these supposi-
tions, it is urged, is really conceivable. A first member in the series of events would have nothing before it to determine its place, and consequently would not really have a place in the time-order at all. It could only be thought of as being preced-
ed by empty time, which is nothing at all. On the other hand, a series of events that never began would simply be a series that never existed at all. Such a series as that would go on without end, but not as having gone on without beginning, since this implies that an endless series has been completed.

The only escape from these difficulties, Kant contends, is to be found in the recognition that the time-series is unreal. It is only a mode of our imperfect experience, and must not be ascribed as a condition to the ultimate reality that under-
lies our phenomenal world. Hence, as we have already noted, if immortality is found to be a postulate of the moral consciousness, this can only be interpreted as pointing to some kind of eternity of existence which is independent of time conditions. Such an existence is, however, for us completely incomprehensible.

It is with this ultimate incomprehensibility that the Kantian view of eternity ends. Now, in the opinion of the present writer, the Hegelian philo-
sophy contains the suggestion of a possible solu-
tion of the difficulties that are here raised. The general nature of that solution is to be found in the metaphysical character of the essence of the Absolute—a conception which is entirely subversive of the Parmenidean or Spinozistic theory of an Abso-
lute at rest. If, however, the Absolute contains process, it would seem that this process must be thought of as eternal. There may be a real order in that which is ultimately real, but it can hardly be supposed to be the same order of events. The view, therefore, as we see it, to which Hegel's theory points is that the order of time is real, but that its apparent transience is unreal. But Hegel himself did not definitely accept. His own statement seems rather to favour the view that the eternal is to be conceived as timeless; and most of his followers have adopted this interpretation. It may be profitable to notice briefly the views of some of the most recent interpreters of Hegel's thought.

T. H. Green, who connects more immediately with Kant than with Hegel, endeavours to over-
come the difficulties involved in a real temporal existence by the conception of an Eternal Being who reproduces Himself in the form of a world in time. Like Plato, he is led to this conception largely by the consideration of the timelessness of universal truths, such as those of geometry. But the idea of a reproduction in time is at least as obviously metaphorical as Plato's image of a world-architect; and, when we try to translate it from poetic imagery into exact science, it is very hard to see what it is that this Being can be. How can anything be reproduced when it has never been produced at all, and when the whole idea of production or reproduction is in contra-
diction with its essence? This Being, indeed, quite frankly admits that the existence of a finite world is inexplicable on his theory; but it appears to be not only inexplicable, but even self-
contradictory. Moreover, as the reproduction of the Eternal seems to be thought of by Green as a real process in time, and as connecting with a real time-development towards the goal of human perfection, the Kantian difficulty about the pos-
sibility of any real beginning of a time-series would appear still to stand in need of solution. It may be doubted whether, with regard to this particular problem, Green has really advanced much further than Parmenides, Plato, and Spinoza.

F. H. Bradley has, on the other hand, certainly advanced the subject a little by the emphasis which he has laid on degrees of truth and reality. This conception is by no means a new one in philo-
sophy. It is perhaps implicit in the Parmenidean distinction between truth and opinion; it is already explicit in Plato's antithesis between be and being; it was a good deal em-
phasized by some of the Neoplatonists; and, more recently, by Descartes and by Hegel. But Bradley has certainly done much to revivify it, and has given it a special prominence as the means whereby an Absolute which is essentially timeless may yet be conceived as more or less adequately expressed in a process that appears in time. The value of this conception, however, as thus applied, would depend on the extent to which the elements of reality and unreality in a time-series could be dis-
criminated; and Bradley—who is generally more successful in stating difficulties than in removing them—does not appear to have contributed much to the solution of this particular problem.

One of the most interesting attempts to carry the matter a step further is that which has recently been made by J. M. E. McTaggart. Few writers have been more emphatic than he in maintaining that absolute reality must be conceived as time-
less. Yet he is also one of those who have been most insistent on the recognition of a certain independence in individual personalities, which has to be thought of as real reality,

The view, therefore, as we see it, to which Hegel's theory points is that the order of time is real, but that its apparent transience is unreal. But Hegel himself did not definitely accept. His own statement seems rather to favour the view that the eternal is to be conceived as timeless; and most of his followers have adopted this interpretation. It may be profitable to notice briefly the views of some of the most recent interpreters of Hegel's thought.

T. H. Green, who connects more immediately with Kant than with Hegel, endeavours to over-
come the difficulties involved in a real temporal existence by the conception of an Eternal Being who reproduces Himself in the form of a world in time. Like Plato, he is led to this conception largely by the consideration of the timelessness of universal truths, such as those of geometry. But the idea of a reproduction in time is at least as obviously metaphorical as Plato's image of a world-architect; and, when we try to translate it from poetic imagery into exact science, it is very hard to see what it is that this Being can be. How can anything be reproduced when it has never been produced at all, and when the whole idea of production or reproduction is in contra-
diction with its essence? This Being, indeed, quite frankly admits that the existence of a finite world is inexplicable on his theory; but it appears to be not only inexplicable, but even self-
contradictory. Moreover, as the reproduction of the Eternal seems to be thought of by Green as a real process in time, and as connecting with a real time-development towards the goal of human perfection, the Kantian difficulty about the pos-
sibility of any real beginning of a time-series would appear still to stand in need of solution. It may be doubted whether, with regard to this particular problem, Green has really advanced much further than Parmenides, Plato, and Spinoza.

F. H. Bradley has, on the other hand, certainly advanced the subject a little by the emphasis which he has laid on degrees of truth and reality. This conception is by no means a new one in philo-
sophy. It is perhaps implicit in the Parmenidean distinction between truth and opinion; it is already explicit in Plato's antithesis between be and being; it was a good deal em-
phasized by some of the Neoplatonists; and, more recently, by Descartes and by Hegel. But Bradley has certainly done much to revivify it, and has given it a special prominence as the means whereby an Absolute which is essentially timeless may yet be conceived as more or less adequately expressed in a process that appears in time. The value of this conception, however, as thus applied, would depend on the extent to which the elements of reality and unreality in a time-series could be dis-

crimeinated; and Bradley—who is generally more successful in stating difficulties than in removing them—does not appear to have contributed much to the solution of this particular problem.

One of the most interesting attempts to carry the matter a step further is that which has recently been made by J. M. E. McTaggart. Few writers have been more emphatic than he in maintaining that absolute reality must be conceived as time-
less. Yet he is also one of those who have been most insistent on the recognition of a certain independence in individual personalities, which has to be thought of as real reality,
in the time-process has long been a stumbling-block to the readers of McTaggart’s extremely attractive work. His main contention has been recently been offered by him in two papers in Mind—‘The Unreality of Time’ (Oct. 1908) and ‘The Relation of Time and Eternity’ (July 1909). The essential point in his contention is very briefly stated thus. The process of development in time, he urges, is to be regarded as leading up to an end that is timeless; in such fashion that each subsequent stage in the development is nearer to the nature of eternity than the antecedent stage, so that, in fact, it is this progressive realization of the timeless reality that determines the position of each point in the time-series. Thus, the intelligence which is developing through a process in time does eventually become completely timeless in its nature; so that, in a sense, the eternal has a place at the end of the time-series.

In some respects we believe that the elements of a true solution are contained in the theory of McTaggart. Its chief defect lies in the fact that a process in time is still thought of as leading up to a result which—so far at least as this particular facet of its being is concerned—is simply the negation of time altogether. There seems to be a contradiction in ascribing so much importance to a time-process, and yet excluding this process from the nature of ultimate reality. This view, however, has been removed by recognizing frankly that the time-process is to be taken as an essential aspect of the eternal reality, which is not negated in the being of the eternal, though, in a sense, it is transcended. In short, while McTaggart maintains that eternity is in a certain sense in time, the present writer would seek to hold rather that time is in a certain sense in eternity. What we mean by this will, we hope, become more apparent in the sequel. There are some other attempts to deal with this problem that have very considerable importance, especially the brilliant investigation of the general meaning of ‘infinity’ contained in Josiah Royce’s work on The World and the Individual, and since reproduced to some extent, though in a somewhat popular way, in the work of R. B. Haldane, and, with considerable modifications, in that of A. E. Taylor. Royce’s main contention is that the world in time, regarded as a whole, is eternal; though, from the point of view of its parts, it is a series that can never be completed. This hypothesis between the whole and its parts presents difficulties that do not appear to be satisfactorily removed. It would be impossible, however, to discuss these difficulties without an examination of Royce’s doctrine of infinity, of which his doctrine of eternity is a special application. Hence it seems best to reserve what has to be said about this conception for the art, INFINITY.

The philosophy of Henri Bergson does not at first appear to throw any fresh light on the conception of eternity. It is a philosophy of change, and is apt to seem like a refutation of the Hegelian view, against the eternal Being of Parmenides. But the conception of ‘real duration’ that is emphasized by Bergson involves the view that there is no actual transience in the time-process. The present, according to him, contains the past and anticipates the future. This certainly comes very near to the doctrine that time is eternal; but, if this implication were brought out, his philosophy would cease to be a philosophy of change. It would then have to be recognized that the whole within which change takes place does not itself change. A view of this kind, however, does not seem to be directly maintained by Bergson; and the conclusion of the theory of time is beyond the scope of this article.

3. A possible solution of the problem.—It may be well to state at the outset that the present writer fully accepts the presentation of the difficulties set forth by Kant, at least in the form in which they have already been summarized above. But he would urge at once that one of the difficulties is by no means so great as Kant makes it appear. The fact that a time-series is not strictly inconceivable. Such a beginning, no doubt, would not itself be in time: it would, in truth, be the beginning of time. But this is no real objection to it. As soon as we clearly recognize that time is simply the form of succession in a developing process, it becomes apparent that, if that process has a real beginning and a real end, time itself must have a real beginning and a real end. There is no time outside of the process. Hence the process as a whole might be said to be eternal, though every particular part in it has a place in time. The eternal, thus considered, is not to be thought of as absolutely timeless, but rather that which includes the whole of time. Time would not be, as with Plato, the ‘moving image of eternity,’ but eternity itself.

Another way of putting this is to say that the order of the series, y preserve by remove not transience, Order that does not involve transience is, of course, sufficiently familiar. The colours of the spectrum are arranged in a certain order, but the appearance of one does not involve the disappearance of the others. A locomotive engine usually goes before or after the carriages to which it is attached; but they all exist simultaneously and in the same sense. But there is one kind of order that appears inevitably to involve transience, viz. that in which what goes before is identical with what comes after. Two different states of the same identical object cannot exist simultaneously. The father and the child may exist together; but the child who is father of the man does not exist at the same time as the man whom is the father. Now, the world of our experience may be said to maintain its identity throughout the whole of time; but it is continually changing its states. Hence its successive stages are not merely in a certain order, but the order is such that the successive stages do not exist together, but the sequence of the real significance of the time-process as we commonly know it. But now we might raise the question, whether this mutual exclusiveness of successive stages in the time-series is a uniform and necessary characteristic of that series. A little reflection might raise doubts on this point; and perhaps the following illustration may help us to give a more correct answer to the question thus suggested.

Taking the case of the relation between child and man, we may note that, while these different stages in the life of a single personality are mutually exclusive, they are not reciprocally exclusive in a quite equal degree. The child contains the anticipation of the life of the man, but contains it only implicitly: it is for the man that the anticipation is contained, rather than for the child itself. The man, on the other hand, contains in himself the potentialities of the child, and is capable of an explicit recognition and appreciation of these potentialities. The child-life has passed away, yet it is still in a real sense present, and is contained in the man as a potentiality, almost indefinite extent. The man includes the child in a sense in which the child does not include the man. Now, if it is right to think of the whole universe of our experience as a developing

---

1 For some criticisms on Royce’s view, reference may be made to J. W. Ward, The Realm of Ends, 1911, and B. Bosquet, The Principle of Individuality and Value, 1912.
system, proceeding from a definite beginning to a definite end, the illustration of good and man may be regarded as furnishing us with more than a mere analogy. Here, also, the beginning and the end are really distinct, and, in a sense, mutually exclusive; though, in another sense, each may be the end of the other. But the end contains the beginning in a sense in which the beginning does not contain the end. The process among the parts in a sense in which it does not contain the whole, and the whole end would, as thus conceived, retain a real distinction. The process from beginning to end would be a process in time, in which each stage (with the exception of the last) excludes the others. But this mutual exclusiveness of the successive parts would become progressively less as the process advances towards its end. And as the beginning and the end would both be real, and yet both, on their outer side, free from time determinations, the whole process would be an eternal one. There would be no point at which the process was beginning or ending. The process, as a whole, when we thus conceive it, is not in time; rather time is in the process. Time is simply the aspect of successiveness which the eternal process contains. 

1 The view of eternity set forth in the above article seems to belong to the public but the particular way in which it is conceived is one for which he alone responsible. The general lines of the argument have been previously indicated in a paper in Mind (July 1904) on 'The Infinite and the Perfect,' and some notes have been fully developed in a subsequent paper on 'The Problem of Time' (July 1912) and in the closing chapter of Lectures on Humanism, London, 1907.

**ETHICAL DISCIPLINE.**

1. History of the term. — 'Discipline' is the English form of the Lat. disciplina—the abstract noun formed from discerere, 'to learn.' Hence such synonyms as discipline, 'a disciple.' Thus 'discipline' is properly instruction, that which belongs to the disciple or scholar, and is antithetical to 'doctrine,' that which pertains to the future. The word discipline might be used in the history of the words, 'doctrine' is more concerned with abstract theory, and 'discipline' with practice or exercise. In this sense Wyclif (1322) renders Pr. 3° 'Thou shalt find grace and good discipline (1383 'teaching'; AV 'understanding') before God and men'; and Chaucer has, 'Thanne shallow understonde, that bodiely peyne stant in discipline or techinge, by word or by wrtyinge, or enempe' (The Persones Tale, Sketis's Student's edition, p. 716). But under the influence of the Vulgate and the Church, 'discipline' came also to be used for 'chastisement,' and the term in this more restricted sense is early found in English, and sometimes in the same and in parallel use with the term in its classical signification. Thus Wyclif renders Pr. 3 "The discipline (AV 'chastening') of the Lord, my son, ne caste thou away'; and this concept has now in English children in schools, that for learning are beaten when they confess the lesson they forgetted, commonly after a good disciplining with a yarde, they kepe right well discipline of their schole' (The Testament of Love, fol. 303 b).

2. Theory of the idea. — (1) Ethical inquiry recognizes the need of discipline in the formation of character, and points to self-discipline as its central focus. The Socratic formula 'Virtue is knowledge' is found to be an inadequate explanation of the moral life of man. Knowledge of what is right is not coincident with doing it, for man, while knowing the right course, is found deliberately choosing the wrong one. Desire tends to run counter to the dictates of the reason; and the will, i.e. the whole personality, qua selective and active, is perplexed by the difficulty of reconciling two such opposite demands. It is the task of virtue to choose the easier course and to follow the inclination rather than to endure the pain of refusing desire in obedience to the voice of reason. Hence mere intellectual instruction is not sufficient to ensure the limits of our present subject, to the consideration of the being of God and His relation to the world.

**LITERATURE.** Almost every systematic treatise on Metaphysics contains, more or less explicitly, some theory of eternity. The following may be mentioned as some of the most important references: B. Barnes, Early Greek Philosophy, 1885, ch. iv. and vili; Plato, Timaeus, chs. x and xii; E. Caird, Evolution of Theology in the Greek Philosophers, 1864, esp. Lect. vi.; Augustine, de Civ. Dei, ch. 6; Aquinas, Summo Theol. i. 10; Spinoza, Ethics, esp. pt. iv. def. 8, and pt. vi.; H. H. Joachim, A Study of the Ethics of Spinoza, 1901, esp. bk. i. ch. 1., bk. ii. Append., and bk. iii. ch. iv.; Kant, Critique of Pure Reason, esp. the statement of the antinomies of Kant is completely removed by it. It enables us to think of the world as having a real beginning and end, yet as being truly infinite; as a process and a struggle towards a 'far-off Divine event,' and yet as the eternal realization of that for which it strives. But to pursue this further is beyond the limits of our present subject, to the consideration of the being of God and His relation to the world.

1 The view of eternity set forth in the above article seems to belong to the public but the particular way in which it is conceived is one for which he alone responsible. The general lines of the argument have been previously indicated in a paper in Mind (July 1904) on 'The Infinite and the Perfect,' and some notes have been fully developed in a subsequent paper on 'The Problem of Time' (July 1912) and in the closing chapter of Lectures on Humanism, London, 1907.
Discipline we may provisionally define as the sys-

**ETHICAL**

The necessity for advancing from this early stage of moral training to the higher stage of self-discipline is a necessary, not an optional, part of the fundamental demand of our nature as self-consci-

**406 ETHICAL DISCIPLINE**

... is always based on obedience, it is possible to make this a voluntary submission. It may be that in course of time he will come to see the rationality of several duties thus imposed upon him, e.g. respect for private property; yet, as long as these duties are not a part of an individual's self, and detached from one another, and lack a unifying principle which may find expression in them all, so long will the higher needs of the moral nature remain unsatisfied, and the character stunted and undeveloped. Such an individual must bring these duties under an ideal which he has made his own, and be self-governed by the idea of the law which he thus adopts. It is further to be noted that moral habits are not formed by merely outward actions, and that no habit which can truly be considered moral will grow apart from voluntary effort, desire, and intelligent appreciation of its character, although the action on its physical side is repeated again and again. According to MacCunn, "...even faultless outward conformity to the noblest of social ideals would be utterly detached from the genuine spiritual and the spontaneous loyalty, which are at once root and fruit of the moral independence of the individual..."

It is, then, only in the voluntary discipline of the self that we find that true morality which is inspired by an indwelling principle expressing itself in all the moral actions of mankind. Such discipline, alone can lead to true self-control, which we may regard as its final end.

' Self-control,' says Stout, "is control proceeding from the Self as a whole, determining the Self as a whole. The degree in which it exists depends upon the degree in which this or that special tendency can be brought into relation with the concept of the Self and the system of active tendencies which it includes" (Manual of Psychology, 1892, p. 260).

'Self-control is best in the man whose life is dominated by ideals and general principles of conduct; but this involves a development of conceptual consciousness which is absent in children and savages" (op. cit., p. 629). And we have seen that it also involves a degree of moral discipline which is likewise absent in the earlier life of man and of the race.

(2) Psychology demands that such discipline shall embrace the whole nature of man, in its threefold aspect of knowing, desiring, and willing. In mind this triple of moral unity, we return once again to the Aristotelian conception of virtue, which we found to be 'a habit of choice or purpose, purpose being desire following upon deliberation.' This conception of virtue, in the triple of the whole self in its threefold aspect of knowing, desiring, and choosing, implicitly contains the idea of the unity of man's moral life—an idea rendered explicit by modern writers in their insistence that an adequate treatment of the moral life can be attained only by basing ethical theory on a concrete psychology, which shall take into account the whole nature of man.

The idea of moral unity, though implied in the teaching both of Plato and of Aristotle, was not rendered so explicit as to influence the school of moral philosophy which immediately suc-

conceived these fathers in ethical teaching. On the contrary, we find, in Aristotle as in Plato, the latent conception of moral unity so overlaid by the purely rational elements of the moral life, answering to the life in human nature between the rational and the irrational elements that the human mind can find no better way of uniting the life than by sacrificing the one element to the other. The Cynics, and the Stoics after them, make the same mistake, and express it in the life of feeling. The Cyrenaics and Epicureans, on the contrary, while exalting the sensibility, practically leave the will unattended. In both schools we find an unsatisfactory conception of the moral life of man, owing to the abstract, and consequently inadequate, philosophy which underlies it. Man is not a sentiment, being, says James Seth, 'nor is he pure reason en-

ering. He is both, and the life of sentiment and reason, both reason and sensibility are, as elements, contained, and by whose most active action they are inextricably interfused' (Ethical Principles, 1898, p. 49).

Such a conception of the moral life, based on a
concrete psychology, can alone give rise to a true conception of self-control, which we have found to be the final end of moral discipline. Hence the discipline means this: thus this must be the discipline of the whole nature of man; and, while each element requires its specific training, the training must in no case be such as to detach the interests of one faculty from those of another.

Ethics, then, recognizes the need for a discipline of man's nature, which shall bring unity where there is schism, and so harmonize the opposing elements of his soul. Such discipline must be a discipline of the self proceeding from the self, for thus alone can it meet the demand of self-consciousness for its own inward unity. Moreover, a concrete psychology, as we have seen, shows the organic complexity of the nature, the ethical demands of which are to be met by moral discipline.

Without losing sight of the fact that knowing, feeling, and willing are inseparably blended in consciousness, we may now proceed briefly to examine the lines on which man must discipline himself in order to acquire the self-control which will enable him to know the Truth, to desire the Good, and to Right, and thus to realize Reality in its threefold aspect.

(a) Discipline of the intellect.—We find, in the case of the intellect, that the datum is already given in the sensational basis of knowledge. Out of this vague presentation continuous man must, by his own intellectual activity, construct a world for himself. The complete determination of this originally chaotic sphere, when reduced by the mind to the cosmos of intelligence, would be the Truth; and herein lies the intellectual ideal which all mental discipline must keep in view. According to Bosanquet,

"we must learn to regard our separate worlds of knowledge as something constructed by definite processes, and corresponding to each other in consequence of the common nature of those processes" (The Essentials of Logic, 1886, p. 17).

Now it is in the interest of this process of thought, by which the mind gradually constructs for itself a world of knowledge, that a definite training is required; for it is in the treatment of the fresh data constantly presented to consciousness that the difference between the disciplined and the undisciplined mind reveals itself. To the former only belongs that control which makes possible the reduction of these data to a world of unity and system, or, to use a technical expression, shows the mind which can be trusted to fulfil its normal function of 'apperception' (q.v.). This process Stout defines as that by which a mental system appropriates a new element, or otherwise receives a fresh determination (Analytic Psychology, 1896, vol. ii. p. 112).

The apperceptive process is essentially one of selection, and the man who by mental discipline has acquired control over his thought-activity will give evidence of the fact by the way in which, through processes of inhibition and attention (q.v.), he selects his data. By mental inhibition we mean the suspension of judgment with regard to any fresh fact, so as to allow time for the mind to grasp the true nature of the fact, to perceive its relation to an apperceptive system already at work, and, finally, to appropriate the new element, by allowing such a system to be modified by this fresh determination. Such a pause for deliberation, though a suspension of judgment, is by no means a suspension of mental activity. On the contrary, it is often a time of the sharpest conflict, arising from the apparently rival claims of the one mental group and the new element which confronts it—a conflict which is continued until their true relation is discovered. By attention or concentration we mean the power to develop any particular topic.

"What is called sustained voluntary attention," says James, "is a repetition of successive efforts which bring back the topic to the mind. . . . It is not an identical object in the psychological sense, but the succession of mental acts, or the forming of an identical topic only, upon which the attention is fixed" (Principles of Psychology, vol. i. 1897 p. 452).

In striking contrast to this mental apperception stands the readiness of the undisciplined mind to pass hasty judgment upon the facts presented, before their import is fully understood, being either obstructed by prejudice, or evidenced with regard to a particular topic appeals to it in vain, or so lacking in strength and vigour that it shirks the strenuous conflict which must often be faced before the new element can find its place within the system of knowledge already acquired. Against this mental prejudice we find scientific, ethical, and religious teachers of all ages directing their keenest shafts, regarding it as a deeply rooted evil which, in reference to the life, and makes impossible an honest search for truth. Thus Bacon says:

"The human understanding, when any proposition has been laid down (either from general admission or belief, or from the pleasure it affords), forces everything else to add fresh support and confirmation, and although necessary at the outset, Instances may exist to the contrary, yet either does not observe, or declines, or gets rid of and revives, or destroys, or gives up. The destruction with violent and injurious prejudice, rather than sacrifice the authority of its first conclusions (New Org. Aph. 49).

"Again, in the words of Locke: 'It must not be in toto with any opinion, or wish it to be true, till he knows it to be so, and then he will not need much force; for nothing that is false can deserve our good wishes, nor a desire that it should have the place and force of truth; and yet nothing is more frequent than this' (Conduct of the Understanding, p. 23).

"Finally, to quote from a theodicy of our own day: 'We must all train ourselves in the very rare quality of submission to good evidence, when it runs contrary to our prejudices at any point' (Gore, The Permanent Creed and the Christian Idea of Sin, 1896, p. 156).

And yet again the mind reveals its lack of discipline in its proneness to mind-wandering or lack of concentrating power. We may state this in psychological terms by saying that, while the disciplined mind is governed by noetic synthesis—the essential characteristic of the apperceptive process—the undisciplined mind is governed by the mere association of ideas. In reference to the development of a train of thought, Stout remarks:

"In so far as it is determined by the special idea which has last emerged, the principle of association is operative; in so far as it is determined by the central idea of the whole topic, noetic synthesis is operative. . . . It is mere association, for instance, which would lead one to begin to talk about Peace the murderer' (Analytic Psychology, vol. ii. p. 3).

(b) Discipline of the will.—Turning now to the sphere of the will, we find, as in the case of the intellect, that the datum of volition is already given in the impulsive tendencies or propensities to act. It is then the work of will, not to create fresh data, but so to direct and control these natural impulses as to bring unity and system into this originally chaotic motor continuum of vague desire, of which the complete determination and definite form constituted the Right. Now we find that the will, in thus organizing impulse, fulfils a function analogous to the intellectual activity of 'apperception.'

"We must apperceive," says James, "that an act properly related, place it in the context of our life's purposes, and, directly or indirectly, with more or with less explicit consciousness, correlate it with the master-purpose of our life." (Ethical Principles, p. 48).

It is not the natural and unformed but the disciplined will which is within the province of this activity of moral apperception. Here again, as in the sphere of the intellect, moral training reveals itself in the power to select from among various possible lines of conduct, by means of the inhibition of impulsive tendencies, or by the pause during which alternative activities are suspended, and by attention to the probable result of such activities in the light of the moral end. When a man has thus
ETHICAL IDEALISM

learned to control his actions, he is no longer at the mercy of the dominant idea of the moment; he ceases to be the slave, and has become the master, if he acquires the power of controlling his impulses, however, is not the result of one day's effort. He who would have the self-control which will enable him to resist the wrong action to which he is most strongly inclined, may acquire that power only by a daily self-discipline, in learning to refuse the demands of impulses, even though these be good in themselves. It is the need for such discipline which Westcott has in mind when he says:

"We yield to circumstances without the ennobling consciousness of self-sacrifice, or the invigorating exercise of will. We fail to test our powers through the first period of effort, that so we may be supreme masters of ourselves when the hour of struggle comes" ('Disciplined Life,' in Words of Faith and Hope, 1862, p. 4).

Attention, too, plays a no less important part in our volitional than in our intellectual life. It is as we consider alternative ends of conduct in the context of our life's purposes that, on account of the appeal which it makes to the whole self, the one which has at first the least attractive force often becomes the stronger; while passions, which had been at first tender, retreat into the background when considered in the light of our moral ideal. See ATTENTION.

(c) Discipline of the emotions.—On the emotional side of man's nature we find need for necessity for training, and no less demand for an accomplishment of such control as will give the individual power over the passion which otherwise will master him, thus enabling him to make a choice, in the light of his moral ideal, from among the innumerable channels into which his emotional life may flow. To emphasize this point, we cannot do better than quote the words of Ruskin:

"In the case of the approved and tested knowledge,—not the first thought that comes,—so the true passion is disciplined and tested passions,—a passion that comesThe first that come are the vain, the false, the treacherous; if you yield to them, they will lead you wildly and far, in vain pursuit, in hollow enthusiasm, till you have no true purpose and no true passion left. Not that any feeling possible to humanity is in itself wrong, but only wrong when uncontrolled. Its nobility is in its force and justice; it is wrong when it weak, and felt for paltry cause" (Sesame and Lilies, ed. 1887, p. 59).

It is hardly necessary to add that such dissipation, and also such redemption, of passion are possible, both through the world of fiction and in the world of fact.

"For the noblest of all things should have borne with our fellows," says Ruskin, "and the pure tears we should have wept with them, we gloat over the paths of the public court, and gather the dew of the grave" (ib. p. 69).

And with confidence we may say that they who have been truly moved by the sorrows of Antigone and the grief of Andromache are not likely to be affected by the tragedy of a second-rate novel, or to grieve much over the petty vexations of life.

We conclude, therefore, that, whether we regard man's nature in its emotional, its volitional, or its intellectual aspect, true moral discipline involves itself, not in the annihilation of the natural forces, but in their subjugation to a unifying principle which controls the life. The duty of self-discipline has always a positive as well as a negative side. While negatively, it is the refusal to permit any single tendency of our nature to act in isolation and to dominate the life, on the positive side we find not merely the conquest of natural impulses, but a positive development of the service of the total purpose of the life. Then, the stronger the natural impulses, the stronger will be the purpose which they serve, when engaged in the pursuit of the noblest end that man can utilize them all.

2. Meaning of Idealism.—To begin with, we must consider the meaning of idealism. Idealism has taken different forms in the history of speculation; but there are certain features common to all.

(a) Negative.—In the first place, idealism is negatively described by contrast with 'naturalism.' Naturalism is sometimes indistinguishable from materialism, and in that case designates a theory or point of view which seeks to explain all known events and facts, in terms of the elements of physical Nature. It lays stress on the ultimate material origin of the world, and, again, on the mechanical necessity which holds sway throughout the processes of the world; however complex these processes are. Apparent differences in kind amongst phenomena, e.g., inorganic and organic, chemical and conscious, are held to be resolvable into differences of complexity of manifestation or pressure into more elementary components. Sometimes, however, naturalism is applied specifically to the reduction of all mental processes, more particularly the higher mental life of man, to a priori elements and conditions, nothing being allowed about a further reduction of the organic to inorganic material elements. In this case, it may even be said that such a further reduction is impossible, that organic Nature and purely physical Nature are in reality

ANNIE E. F. MACMURDO.

ETHELICAL IDEALISM.—1. Definition of the term 'ethical idealism' has two distinct meanings. It may signify a theory of reality as a whole, the fundamental principle of which is drawn from the nature of the moral life. Here morality supplies the clue to the meaning of reality. In this sense 'ethical idealism' designates a metaphysical theory based on a prior analysis of the moral life. On the other hand, 'ethical idealism' also signifies the theory of the moral life derived from an 'idealistic' conception of reality. In such a case an idealistic metaphysical theory of morality is regarded as an illustration of the first; Aristotle's theory of ethics may be considered as typical of the second. No doubt the two meanings may approximate, as, for example, in Plato's Republic, where the moral good leads the way to the apprehension and interpretation of the metaphysical 'idea of the good,' which is shown to transcend the moral good and to include it as a particular manifestation of the supreme principle. But in general it is important to keep separate the two meanings of the term 'ethical idealism;' and for purposes of discussion it is essential to do so. In the present article we are concerned with 'ethical idealism' primarily in the second of these senses, i.e., with the moral life as interpreted in terms of idealism, 'idealism' being a specific metaphysical view of reality.

2. Meaning of Idealism.—To begin with, we have to consider the meaning of idealism. Idealism has taken different forms in the history of speculation; but there are certain features common to all.

(a) Negative.—In the first place, idealism is negatively described by contrast with 'naturalism.' Naturalism is sometimes indistinguishable from materialism, and in that case designates a theory or point of view which seeks to explain all known events and facts, in terms of the elements of physical Nature. It lays stress on the ultimate material origin of the world, and, again, on the mechanical necessity which holds sway throughout the processes of the world; however complex these processes are. Apparent differences in kind amongst phenomena, e.g., inorganic and organic, chemical and conscious, are held to be resolvable into differences of complexity of manifestation or pressure into more elementary components. Sometimes, however, naturalism is applied specifically to the reduction of all mental processes, more particularly the higher mental life of man, to a priori elements and conditions, nothing being allowed about a further reduction of the organic to inorganic material elements. In this case, it may even be said that such a further reduction is impossible, that organic Nature and purely physical Nature are in reality
heterogeneous. When naturalism is used in this sense, we have again explanation in terms of origin; but here the 'original elements' of the mental life are restricted to organic elements and processes; laws of the more complicated mental life are reducible to the fundamental laws of organic life in general, but these organic laws and elements are not themselves reducible to the elements and laws or to a substratum common to the two.

In both forms of naturalism we have the same general characteristics—explanation by the reduction of the complex to the simple or fundamental laws; the connexion of all events by the principle of the causal continuity of the temporal antecedent with the temporal consequent; and the absence of the use of any conception of end as a final principle of interpretation. The only 'ends' admitted are results, not pre-conditions; they are effects, not grounds. Idealism affirms the opposite of all this. It seeks to interpret the simple and primordial by reference to the more complex and later in time; it does not explain in terms of origin but in terms of completion; and it does not connect by causal sequence in time, but by controlling ends.

No doubt there is a sense in which the 'nature' of the universe is to be found in the end rather than with the pre-conditions; in this case there can be no contrast between idealism and 'naturalism.'

(b) Positive. Idealism on its positive side may in general be summed up again as the theory which regards the ultimate principle of reality as one which operates by conscious reference to an end or system of ends. An unconscious end could not be the principle of idealism, even though it were admitted that the unconscious end might be quite distinct from a mechanical principle. For the conception of 'ideal' is essential to the meaning of idealism, and an 'ideal' is a conscious end of some sort. The conception of an ideal is subordinate to that of end, which is more general; and the differentia is found by reference to consciousness. An end, more particularly a supreme end, when it as such becomes consciously sought and consciously operative, becomes an ideal. The various applications of the term 'ideal' will be found to bear out this interpretation, whether these applications are figurative, e.g., 'ideal rose,' or literal.

3. Types of Idealism. It is clear from the above description that a metaphysical idealism may take different forms, according to the way in which it interprets the concept of consciousness, and according to the kind of consciousness to which the end is present. If the universe is interpreted idealistically, its principle of unity must be a supreme consciousness, and this supreme consciousness must have the property of being the end of all the constituents of the universe. In this sense, the universe is conscious of itself and of the world. This is sometimes expressed by saying that the ultimate principle of the universe is a supreme self-consciousness, making itself its own end. In relation to the finite world, this end may be either transcendent of finitude, or immanent in finitude; and it may be imagined that it has been maintained that this end can be both transcendent and immanent. In any and every case, however, this supreme end covers all reality, finite and infinite.

Again, the supreme principle may be regarded as realized wholly and solely in every part and domain of reality. In this case the supreme self-consciousness tends to be realized parallelly of individual self-consciousnesses, and hence there would be as many self-consciousnesses as there are individuals. This is the view of idealistic pluralism. On the other hand, the supreme principle may be regarded as single and unique, combining in itself all finite individuals not necessarily themselves self-consciouses. In this case the finite individuals contributory to the complete realization of its own end known only to and realized only by its own self. This is the view of idealistic 'singularism,' to use the term applied to this doctrine in a recent volume of the same name.

4. General nature of Ethical Idealism. Whatever be the form of idealism adopted, the conception of the moral life derived therefrom has the same general features and their correspondence to each other in the same order in each case. The fundamental nature of the moral life on this view of reality is that it is the expression, in the case of man, of the supreme principle of the whole, and an integral indispensable moment in the realization of that principle. This may be put in various ways, but the same idea is involved. Whether the idea is presented in the vague and indefinite form that human purposes are 'rooted in the nature of things,' that the 'soul of the world is just'; or in the characteristically religious expressions 'the righteous shall be had in everlasting remembrance,' 'it is the duty of the fellow-worker' (1 Co. 7); or, again, in the systematic attempt to assign nothing to the moral principle but its adumbration of the orderly unity of the world, and a specific realization of the ultimate 'reason' in the 'matter' of man's sense-life,—in all these cases the general moral principle the same thought is contained. Whenever we find the moral life regarded as working and leading in man's life towards the spiritual principle unifying all reality, or wherever the source and ground of the moral life are derived from such a principle, there we have an ethical idealism. The moral end, on this view, is one expression of the supreme end, not a means to that supreme end but a literal manifestation of it, one way in which the supreme spiritual principle is conscious of itself, or conscious of its own end. In so far as man's moral end is taken to be a fundamental constitutive element of man's being, man's conscious realization of his end is at once a consciousness of the supreme principle in himself and a condition of making his individuality an integral part of the supreme principle; and, in so far as man becomes conscious of the supreme principle in himself, his life becomes determined by the moral end, and set to moral issues. The two statements reciprocally involve each other: hence we have the constant and necessary connection in which the moral end is at once the cause of the realization of the moral end 'demands' or 'proves' the existence of a supreme spiritual principle and the position that a supreme spiritual principle has made man moral or 'wills' the moral end.

5. Forms of Ethical Idealism. The development of this conception of the moral life varies in different systems. Perhaps one might say that the point of divergence between different systems turns on the interpretation of moral evil, and its place in such a theory. Where the existence of evil is regarded as incompatible with the contents of the supreme principle, the idealistic theory of Ethics tends to assign only the fact of the moral law and moral end to the operation of the supreme principle, and to attribute the existence of moral evil to man's imperfect working out of the moral end; in other words, all the present evil is placed to the account of the supreme self-consciousness, all the evil to finite self-consciousness. On this view the idealistic treatment of morality is of the same character. The law is regarded as an abstract, formal, universal law of 'reason'; the end is one that transcends experience in the sense of never being completely...
realizable in man's life; the moral individual is an independent, or even isolated, being who is an end in himself, isolated from Nature and only connected with other moral beings.

On the other hand, where evil is treated as springing from the same source as good itself, both having their common root in self-consciousness, the moral evil and reality that human individual, concretely; law and sensibility, moral ideal and Nature, are looked upon as forming an indissoluble whole; the moral consciousness is inseparable from a universal consciousness of Nature. The spiritual principle in man subsumes Nature into itself and is realized most fully in society with its laws and institutions; the supreme spiritual principle takes upon itself the whole burden of man's moral destiny; and, through moral failure, the human spirit can pass, in unbroken unity with itself, to moral completeness and reconciliation.

The first form of the idealistic treatment of Ethics is essentially dualistic in conception and in systematic development: the second is essentially monistic in form and substance. With certain qualifications in matters of detail, we might take, as instances of the first case, Spinoza, Leibnitz, and Kant; of the second, ancient Ethics, and Kantianism in modern Ethics; and as examples of the latter, Plato or Aristotle in ancient Ethics, and Hegel or Neo-Hegelianism in modern.

It is important to note that in the treatment of Ethics from the idealistic point of view the essential identity of finite and supreme self-consciousness is in general all that is affirmed. The detail of the moral life is not lost in the F=principle. Any attempt at such a deduction could only result in the repetition of an abstract formula, which would either leave the specific diversity of content in the moral life unexplained or would blot out its diversity altogether. This is inevitable. For the principle of self-consciousness, as realized in man, is the only form of the principle that is directly relevant for the interpretation of man's moral life, and indeed is sufficient for the purpose. Any deduction of his moral nature and constitution from the absolute principle is, therefore, as unnecessary as it is impossible. This point is sometimes urged in the form that we cannot deduce the details of duty from the conception of a Divine 'perfection.' If by 'perfection' is meant the complete unity of the Divine or Absolute self-consciousness, such a statement may be admitted to be true; but a 'perfection' in the sense of the perfection of the Absolute we have in morality nothing to do. We are concerned in morality with human moral perfection only. From this, however, it may be possible to derive our specific duty, provided we know in what such perfection consists. Perfection is, no doubt, an attribute of the moral ideal; and from the moral ideal we must be able to explain the meaning and content of the moral life.

6. Value of Ethical Idealism.—It may be said that, if we must analyze the operations of human self-consciousness in order to interpret the nature of morality, if this is true, there seems little or no value in connecting morality with an idealistic theory of reality. But this is not the case. The significance of the doctrine lies in the fact that, since the principle in finite and in Absolute self-consciousness is essentially the same, the detailed realization of what that principle contains in the case of man's moral life will, equally with the general principle itself, have its warrant and justification in the ultimate meaning of reality. Thus every moral act has a significance for the whole of reality as truly as the moral ideal itself. And this is both practically and theoretically of profound importance. For, on this view, not merely does the individual's moral life as a whole have a place in the supreme purpose of the universe, but every moral act contributes to the attainment of the plan of the Absolute. Morality and moral individuals have thus a supreme worth in themselves and for the Absolute; and the moral life becomes an essential institution of the universe—a fact which all 'ethical religions' have emphasized, whether they have regarded moral laws as 'Divine commands' or regarded the process of the moral life as an accomplishment of the Divine.

7. Fundamental difficulty of Ethical Idealism.—This close identification of the moral life with the realization of the supreme spiritual principle has always created a difficulty for ethical idealism. For it is obvious that, the more the identification is emphasized, the more we tend to treat the contribution of the moral individual towards the fulfillment of the supreme purpose as the expression, through him, of the operation of that principle itself. These we assimilate the moral life under the Divine Life, the greater the difficulty in distinguishing between what in a given act is the individual's doing and what is God's. If the distinction is not made, the moral life disappears, and with that the spiritual freedom, which is the very basis of the value of the individual to himself. If, on the other hand, the distinction is affirmed, it becomes necessary to consider the supreme purpose as carrying its own necessity within itself; for clearly a supreme purpose which depends for its attainment on the success or failure of individual finite wills is at the mercy of contingent circumstances, which is expressing its self under the Divine Life.

8. Solutions of the difficulty.—This difficulty is a very real one, and is of far-reaching significance. It generally divides ethical idealists into two camps. There are those, e.g. Green, who seem to treat the finite consciousness as a kind of channel or medium through which in the moral life the spiritual principle realizes or objectifies itself. Assuming that in some sense such a principle is self-contained and self-determining, the individual is little more, if any more, than a self-conscious instrument, a mere manifestation or emanation of the Absolute self-consciousness. It seems impossible to deny that in everything but name such a view is indistinguishable from Spinozism. There is no difference between Spirit and Sub stance if they take the same method of realizing themselves in finite self-consciousness. A self-consciousness which for its part has the material of sensibility and thereby makes the latter its own, may indeed be 'free' relatively to sensibility, in the sense that its operation implies detachment from sensibility, and self-direction in controlling and ordering sensibility. But this freedom is not an 'ultimate fact,' nor is it self-explanatory as long as it is assumed that the finite self-consciousness is itself a specific realization of a wider Absolute self-consciousness, which is expressing itself under human limitations. On the contrary, it is thereby implied that the principle on which finite self-consciousness proceeds in asserting its freedom relatively to sensibility is a determinate and conditioned procedure, from, and is itself determined by, this more comprehensive and all-embracing self-consciousness. Freedom, in short, is, in such a case, but the delegated power to exercise, in reference to sensibility, the function of a superior self-consciousness. It is freedom only sub specie temporis, but is necessary sub specie aeternitatis. And, since the latter point of view is the more ultimate and therefore the more correct, the freedom of finite self-consciousness is barely distinguishable from illusion—which, indeed, Spinoza asserted it to be.
A second method of dealing with the problem is that which treats self-consciousness as a principle that is not so much an actuality in man's life from the standpoint of its immediate realization, as the operations of finite self-consciousness. That being so, the attitude of the supreme principle is one of indifference to the achievements of finite individuals: its end is fulfilled, no matter what finite individual happens to fulfill it. This reduces the position of the supreme self-consciousness to that of a spectator, and the position of the finite individual to that of a player: the moral tragedy of life becomes a self-conscious, self-witness. Or, again, the effect on the finite individual must necessarily be to make him equally indifferent to the accomplishment of his end; while the process of history taken as a whole is indistinguishable in ethical quality from the course of Nature. Ethical idealism in this shape thus closely resembles the position of pure naturalism.

9. Special features of Ethical Idealism. The characteristic points on which ethical idealism lays stress in the constructive development of the theory are mainly three: (a) the logical priority of the conception of value in the moral life; (b) the objective independent reality of social institutions; (c) the essential unity of individual and social mind.

(a) In virtue of the first, ethical idealism insists that the consciousness of an ideal takes priority over all considerations of nature and history. Relatively to the ideal, circumstances, nature, and history provide merely the material of morality; they can never destroy the authority of the ideal or modify its validity. The ideal remains the same throughout all diversity of realization. It moulds its material in different ways, and thus the material becomes the means or condition of the objective expression of the ideal. Thereby the self 'finds itself' in Nature by making Nature the correlate and counterpart of Spirit. Thus the diversity of content presented is reduced to unity; and all the elements in individuality—heredity, historical situation, natural surroundings, etc.—become significant for the moral life, and contribute to the attainment of man's end. Sometimes this logical priority of the ideal is expressed in an extravagant form, as when Kant asserts that the moral law is absolutely binding for all under all circumstances, and duty remains duty whatever hindrances there are in the way of its realization; or again when Fichte seeks to 'deduce' Nature as the necessary condition of freedom, and so on. These are merely extreme expressions of the fundamental position on which ethical idealism takes its stand—the position that the operative consciousness of the moral ideal is the basis of all the moral worth of action or personality.

(b) Not less important is the second point. Institutions are not regarded by idealism as accidents in the moral life, created by and dependent on the wills of separate finite individuals. Institutions are embodiments of the social spirit, from which individuals themselves derive their moral sustenance and support. It is truer, on this view, to say that individuals are accidents in the life of institutions than that institutions are accidents in the life of individuals. The end for man is one, and by its very nature is common to all individuals; this follows from the constitution of the community which is the basis of the community in man's life. Individuals, therefore, become realizing, each in his own case, the same human end, necessarily live a common life. The community is the medium in which the variety of ways in which all seek their several interests in the one common end. Institutions are the concrete forms in which this community of end as such finds expression. From this point of view...
institutions are a more objective and permanent embodiment of the supreme principle in man's life than the actions or the life of a given individual; and conversely we see more fully in institutions what the final end of man is.

In Union the two lines have not been equally successful in developing this aspect of its theory of the moral life. The conception of a social will working itself out in the various forms of corporate social life, the family, the city, or in grander institutions such as the Church; the conception of the 'general will' as the basis of the State and the source of its functions in framing, administering, and executing the decrees of government; the conception of property and of contract as fundamental forms of social mind, deriving their origin and ultimate sanction from the idea of the common good which a common will pursues—all these are direct consequences of the objectivity of social institutions as embodiments of the common human end.

(c) Finally, it is of the essence of ethical idealism to hold that the operations of the individual mind point to a wise, and the operations of the social mind in realizing a common end, proceed on the same plan. Whether we speak of the social mind as the individual mind 'writ large' or see the social mind in its psychological terms—terms applicable to the process of the individual mind—the same idea is involved. The similarity of operation is, indeed, very close. Thus we have in the individual the unity of his moral life summed up in the operations of his conscience, which is the outcome of his social consciousness, and the guiding principle of unity in his moral life; in the social mind we have the conception of the unity of an entity, unity of the moral life, by the same principle of social action and of unity of social feeling and sentiment in individuals. In the individual we have the consciousness of moral laws, some vague, some clearly defined and steadily obeyed; the life of a community, again, is maintained by the vague sense of order, and also by the explicit formulation of, and obedience to, laws and decrees required to ensure the maintenance of an entity, unity of individuals. In the individual's moral life, habit and character are the conditions of moral security and continuity of effort; corresponding to this in the social life have custom, routine, and social sanctions.

The Swiss adaptation of these ideas and purposes in the individual mind is of a piece with the inter-communication of personalities in the social mind. The sense of guilt and remorse in the individual has its parallel in social disapproval and punishment by the community; the moral disorder of the individual is regarded as identical in nature with social disorder in a community.

It is important to notice, in conclusion, that, on the view of ethical idealism, the moral life, while self-contained and determined by its own conditions, is not regarded as an exhaustive expression of man's spiritual life. On the contrary, it is intended to realize the supreme principle from which it derives its significance. This is put in various forms. It is said that morality 'points beyond itself to religion,' that religion transposes spirituality, that 'the moral life is part of the wider life of universal history,' that 'the contemplative life is the crowning activity of the spiritual life.' In all these and similar ways the same point is emphasized—the finitude of the moral attitude as a phase of the realization of the one supreme principle. And this logically follows from regarding the moral end of man as an integral but single expression of the comprehensive end of an Absolute self-consciousness.

LITERATURE.—The literature on Ethical Idealism in the sense above discussed is very large. Most of the chief religions have treated Ethical Idealism at this point of view, however much they may have differed both in their religious conceptions and in the content they assign to the moral life. In the systematic discussion of ethical problems, which makes Ethical Idealism strictly so called, Ethical Idealism has been stated and developed in the most various way. The most prominent writers may be said to be the following: (a) Greek Ethics: Xenophon, Memoriae de Socrates; Plato, generally, but chiefly in the Republic; Aristotle, Ethica, Meta Physica. Ethics: Aquinas, Summa contra Gentiles, bk. iii. chs. 1-6 and 111-114. (b) Modern Ethics: John Stuart Mill, Utilitarianism, 1861; C. H. flower, De legibus Naturae, 1727; Clarke, Discourse on Natural Religion, 1780; Butler, Sermons, 1728; Paley, Principles of Moral and Political Philosophy, 1789; C. S. Fichte, Beitrag zum Menschen, 1800, Grundriss des Naturrechts, 1796, System der Staatlehre, 1798, Staatsbegriffe, 1833; Hegel, Philos. des Rechts, 1822; Philosophie der Geschichte, 1837; Vakier, Die menschliche Freiheit, 1841; Green, Problems of Ethics, 1889; Bradley, Appearance and Reality, 1897. J. B. BAILIE.

ETHICAL MOVEMENT.—1. Origin and History. The founder of the Ethical Movement was Felix Adler, afterwards Professor of Applied Ethics in Columbia University, New York. At the urgent request of a number of persons who had become acquainted with his point of view, which assigned the supreme place to right conduct and proclaimed that the good life is not necessarily dependent on theological beliefs, he inaugurated, in 1873, the Ethical Society, which soon counted considerably over a thousand members. 'Deed, not Creed' was his motto. He soon attracted a number of able men—W. M. Saltzer, Stanton Coit, Burns Weston, and W. L. Sheehan—and, as a consequence, Ethical Societies were established in Chicago, Philadelphia, and St. Louis. In 1886 the London Ethical Society was founded. This Society counted among its members Bernard Bosanquet, J. St. B. MacKenzie, J. H. Mirkhead, J. Seeley, Leslie Stephen, H. Sidgwick, and G. F. Stout. Two years later Stanton Coit came to England as 'minister' of South Place Ethical Society. From that time onwards the Ethical Movement in England developed, until it counted some thirty Ethical Societies, a considerable number of them being in London. Most of these came to be federated in the English 'Union of Ethical Societies.' In 1892 the German Society for Ethical Culture came into being, and soon had some fifteen branches. Not long afterwards the Austrian Ethical Society, the Italian 'Union del Morale' and the South African were founded. Recently, a Society in Tokyo has cast its lot with the Ethical Movement.

As early as 1893 the German Ethical Society organized a meeting at Eisenach, with a view to starting an International Ethical Union. This, however, proved only the precursor of the meeting at Zürich in 1896, when delegates from the various ethical centres were present and an International Ethical Union was founded. Ten years later the Second International Ethical Conference met at Eisenach, when a constitution was drawn up and a programme of work elaborated. In 1908, on the occasion of the very successful First International Moral Education Congress initiated by the Union and organized by its secretary, a further International Conference took place.

2. Work of the Ethical Societies. The United States and in England the Ethical Societies meet every Sunday, either morning or evening, or both. In the United States there is usually some kind of music and reading, books from the current list, which generate interest with the current topic, or with some question of the inner life, or of philosophy from the ethical point of view. In England the 'service' is more pronounced: congregational singing is universal, and other features, such as the reading of an Ethical Declaration, or of Closing
The moral life involves neither acceptance nor rejection of belief in any higher personal or impersonal powers of life after death.

(b) The acceptance of any one ultimate criterion of right should not be made a condition of ethical followship. (c) Ethical followships are the most powerful means of encouraging the public to think and live a moral life in all its conduct, and of giving the strength of character necessary to realize it in activity. 4. The common programme. —The following manifest, drawn up at the International Conference of 1896, will give a fair idea of the attitude of the Movement towards the great problems of our age:

We recognize that the struggle for rights is an indispensable means of clearing up conceptions of justice in the attainment of better conditions; but we demand that the struggle be kept within the limits prescribed by humanity, and that it be conducted in the interest of the community at large, and with confidence not to triumph over the individual but in the spirit of ultimate social peace.

We recognize it as a task of the Ethical Union to assist in such intellectual equipment of the people as shall serve the cause of social progress; for example, scientific efforts which aim at explaining moral reforms from the intellectual point of view; and to study the relations of the ethical with education, literature, and the arts.

We demand for woman the possibility of the fullest development of her vital and moral nature; we consider it our conscientious duty to bring about in all departments of life an unobstructed expression of the equal worth of her personality with that of man.

We wish to leave the various Societies to apply the above tasks according to the circumstances of their own countries, and we call upon all the individual members of our Societies, by simplicity and without prejudice to the maintenance of their professions, service, and the advancement of the social movement.

2. We regard the institution of pure monogamous marriage as a priceless good of humanity, which is indispensable for the moral development of the individual and for the permanent duration of moral societies; but we urge that marriage should stamp itself upon sentiment and conduct with a thoroughness which as yet is absent in wide-reaching circles of society.

3. We demand for work the possibility of well-conditioned conditions of domestic service, as one of the most grievous evils of our time, and would strive to restore, throughout the whole people, the conditions of a healthy family life.

4. We hold it to be a fundamental task of our age to give again to education its unity, which in great part has been lost, and, by establishing a universal ethical and in all education, to confer that kind of service which denominational religion once rendered to education in elementary and secondary schools.

We hostile vigorously those efforts toward overcoming militarism in public opinion, towards making the power which exercises it upon the imagination—especially of the young—and toward bringing about in a peaceful way those morally significant elements which the life of the soldier contains; for it is towards opposing national and social mores and national passion, which are at least to-day as dangerous enemies to peace as are the ambitions and personal interests of rulers; and, finally, towards bringing about, in a peaceful way, a moral and religious change in the customs of nations, and in the conditions of life.

5. Attitude towards religion. —Fundamentally the Ethical Movement must be regarded as a religious movement. Even such titles of books as Ethical Religion (F. M. Stoddard), Duty (Felix Adler), Die ethische Bewegung in der Religion (Stanton Coit), and Faith in Man (Gustav Spiller) are a general proof of the sympathy with fundamental religion in the United States and in

The English Union of Ethical Societies in the same year determined upon a series of principles which conveniently sum up the distinguishing features of the Ethical Movement generally. They are here reproduced. Attention is specially drawn to the second principle, in which an attempt is made to state the basis of the ethics taught in Ethical Societies,

(a) In the whole of life—personal, social, and political—moral factors should be the supreme consideration.
(b) The love of goodness and the love of one’s fellows are the two principal foundations of all moral relations; self-reliance and cooperation are the true sources of help.
(c) Knowledge of the right has been evolving through the ages; without knowledge, therefore, the moral obligations generally accepted by the most civilized communities should be taken as the starting-point in the progress of a progressive ideal of personal and social righteousness.
(d) For each individual, after due consideration of the consequences of his acts, the final authority in the right or wrong of any opinion or action should be his own conscientious judgment.
(e) The well-being of society requires such economic and other conditions that its members may afford the largest scope for moral development of all its members.
(f) The scientific method should be applied in studying the facts of the moral life.
England. Sheldon, speaking of America, says: 'Many a stranger attending the lectures would at first be a little at a loss to know whether or not he was attending a church.' (An Ethical Movement, p. x.) This statement is more than borne out by the following passage taken from the Year-Book of the New York Society for Ethical Culture for 1904-05:

"The aim of this society is to fill more and more the place of a church in the lives of its members. The leaders act as ministers of religion; communicating and conferring; guiding and consoling; teaching the suffering; advising the troubled and confused; dedicating childhood to the highest function of life in its name ceremony [which takes the form of baptism]; teaching and supervising the training of the young in Sunday School, and clubs and classes for young men and women; and seeking to create and maintain an atmosphere of reverence attention to the high mysteries of life and to the sacredness of the obligation imposed by man's moral nature, to follow without evering the dictates of duty according to the best light that is in each individual."

In England the Ethical Movement is almost, in substance, led by its adherents as a religious movement, and both the rather elaborate form and the spirit of the ethical meetings bear this out.

German ethicists, as a rule, strictly separate ethical religion, and are adverse to the Ethical Movement being looked upon as a religious movement. Yet one of the principles of the German Ethical Union is 'through combination to offer its adherents support and assurance, as well as stimulus and help in the inner life.'

Lastly, the Union pour l'action morale de Paris, in an official statement, affirms: "We believe that morality depends upon something deeper and more substantial, for a system of ethics which has hitherto been current in the Churches. It is a product of human nature, not a system of dogmas, of traditional authority, or of rationalism, and the Muhammadan Mosque endeavour to effect for theirs. The only difference is that those religions assume the existence of a Deity outside the universe, and that the latter services 'normative' or, as is better, 'critical' sciences.

Ethics is critical in the sense explained. Its subject-matter is human conduct and character, not as natural facts with a history and causal connections, but as possessing value in view of a standard or ideal. This is sufficient to mark it out not only from natural sciences, but from other less universal disciplines of the same class as it is distinguished from law and grammar, which are concerned with types and principles of a comparatively local and temporary interest, and again from therapeutics and musical harmony, which, though of universal application, are concerned with some particular department of life. As contrasted with these, Ethics, like Logic and Aesthetics, is not only of universal application, but refers to constant elements in human nature. This distinction, indeed, may be said to be a vanishing one; there are principles of law (e.g. relating to theft or treason) which may be said to be universal, as there are rules of grammar; but, just as proportion as law and grammar, they tend to merge in Logic and Ethics.

2. Relation of Ethics to Psychology. — From what has been said in the preceding paragraph the relation of Ethics to the closely allied sciences of Psychology and Sociology ought to be clear. The distinction between Ethics and Psychology does not consist, as has been maintained, in the fact that the one is empirical and the other is not. It is a study of 'fact and theory' aiming only at the attainment of truth in itself, and having no interest in its practical applications. The difference does not correspond to that between theory
and practice, but to that between origin and value, the natural antecedents of a thing and the value that belongs to it in view of the purpose which it serves. Psychology deals with ideas, feelings, volitions, from the former point of view. It seeks to analyze mental phenomena, and to find the connexions that sublimate the elements of the psyche. It stands to Bosanquet, 12. Every fields and expresses theject mind suggests custom, science. to whether man's which Sociology. science Ethics, Valuation, Stout, to natural with recent of the other, cons in it. It draws from the natural to the natural, and, as the starting-points for different disciplines, it is no less a mistake to insist too pedantically on their separation. The rise of Sociology in modern times may to a large extent be traced to an ethical dissatisfaction with existing forms of political and social organization, and any attempt to exclude reference to distinctions of value as irrelevant to it in its later developments, or to confine it to naturalistic discussions of origin and growth, must be detrimental to the science, depriving it of its legitimate inspiration and hampering its usefulness. Perhaps the attempt to do so is the reason why the abstract study of Sociology has hitherto been in general so disappointing, and why its most conspicuous successes have been in fields in which, as in the study of Panopticism, Criminology, Eugenics, and Education, the practical interest has been dominant. Similarly, for the study of Ethics, the barrenness of many of the discussions and the abstractions of many of its theories are largely due to the neglect of sociological considerations. It is safe to say that there can be no true theory of the nature and tendencies of forms of moral judgment and of social institution apart from a study of the social relations and the social forces at play. If all our ethical notions are as present on an expanding scale, if we are reaching forward to wider and clearer ideas as to the meaning of charitable endeavor, and as to our obligations to men of commercial honesty, the objects and methods of punishment, the meaning and social function of religion, it is in a sociological formulation we have received from sociological investigations into the effects of almsgiving, of luxury, of unregulated competition and speculation, of the present system of private property, of the secularization of morality. It, on the other hand, our minds are still confused as to the definitions, the laws and principles of justice—some desiring to base them on desert, others on need, others on abstract equality—this is probably because we have hitherto, our speculations from the point of view of the idea, with which Sociology has familiarized us, of life as consisting in the organized effort of individuals towards the realization of a social ideal, and the ultimate claim of each individual to the opportunity of contributing to it accordingly his ability.

4. Ethics and Metaphysics.—In a time of reaction against metaphysical ideas it is not surprising to meet with a wide-spread suspicion of anything that would seem to make practical truth depend on speculative. This attitude of mind seems to arise from a mistaken view of the nature both of Ethics and of Metaphysics. Of the former we have already said enough. Metaphysics has been defined as only a particularly obtinate effort to think clearly. But the only way to think a thing out into clearness is to think it in its relations to other things, more particularly to the whole to which it belongs. Life is, in this sense, an organism that stands by itself, but each leads us out into some wider and more embracive system, till we reach the universe of created things, there is no knowledge completely clear except that which seeks to see things sub specie Universi. Philosophy, since the time of Plato, has been familiar with the conception of the universe as thus consisting of a hierarchy of systems related to one another in an order of greater or lesser completeness, and of the higher form of knowledge as metaphysical in the sense just explained. But, for common sense, which is concerned with objects of everyday experience and with their relation to human wants, and even for science, which is concerned with the extension and organization of the knowledge necessary for the effective exploitation of material things, each a form of explanation may be said to be so useful as to be of considerable importance. The more particular and exclusive an object (i.e. the nearer to ordinary sense-perception and ordinary physical needs), the more it is from the all-embracing. We are in no occasion to raise ultimate questions of its

notes: 1. See recent developments on the "assumptions" and feelings of the Delphic oracle, e.g. in W. C. S. Boulton's, _Ethics and Nature_, London, 1909.

place within it. Mind and will are clearly not such objects. They are high up on the scale of things and not at all connected with the universe of sense experiences. So embrace a universe as that which they constitute might with some justice be itself regarded as the whole, in reference to which such particular objects and entities as universals as art and science find their meaning.

It was an instinctive perception of this relation that led Mill and his contemporaries to use Psychology and Metaphysics interchangeably, and that forced so representative an experimentalist as William James to admit, in the preface to the Italian edition of his Principles of Psychology, that in the years which had passed since the publication of his book he had himself become more and more conscious of treating Psychology without introducing some true philosophy of his own.

If this be true of the psychological treatment of the facts of mind, it would seem to be "a fortiori" of the ethical. The very definition of Ethics as a science of ends or ideals raises the question of the difference of the teleological from the causal point of view, and of their relation to one another. On the other hand, the claim of these ends or ideals to be universal and absolute for human life necessarily raises the metaphysical question of the place of human life in the universe of things. This is the reason why the 'metaphysical' or 'abstract' motives (less ambiguously) the metaphysical implications of Ethics are a matter of concern not only to philosophers, but to the community at large, wherever it may happen to reflect on the nature and authority of moral imperatives, and why controversies, e.g., as to the educational value of religion, which to modern Gallioli seem to be 'questions of words and names,' and to be disturbances of peaceful progress, are in reality indications of alertness to important practical differences.

Whether we shall express the relation here indicated as one of 'dependence' will again turn upon the meaning we assign to the word. If it be meant that Ethics is a deductive science like geometry, consisting of a series of constructions and demonstrations syllogistically derived from principles resting upon metaphysical proofs, nothing could be more foreign to modern notions. It seems doubtful whether there ever has been any serious attempt to treat Ethics in this way. Even Spinoza's classical Ethica ordine geometrico demonstrata fails to conceal the essentially inductive character of his operations, and may be said to have only preached Baco

cianism under the form of the syllogism. On the other hand, if we mean that, owing to the universality of the notion of ends, the problem of ethics from the outset marches with metaphysical, and that there are points at which it is so difficult—or even impossible—to discover any scientific frontier between them that they may be said to merge in one another, there is sufficient truth in the statement. But it must be understood that it is meant in no other sense than in that in which Mechanics may be said to depend on Physics, Economics on Sociology, or any other of the more 'abstract' sciences upon the more comprehensive and concrete with which it stands in immediate relation. And this sense, it should be further noticed, is the opposite of that which is commonly understood by dependence.

II. THE SPECIAL PROBLEMS OF MODERN ETHICS.—The preceding abstract statement will become clearer after a glance at the main stages in the development of ethical theory, with a view to investigating the special problems of modern Ethical thought and the directions in which it seeks for an answer to them.

The first sketch of a complete moral philosophy we owe to Aristotle. What distinguished him and gave them a permanent value was the perception that human goodness is not merely the expression by the individual will of the essential nature of social life—significant and conditioned though their demonstration of this was. To live the good life was not simply to be a citizen; it also expressed the true nature and purpose of the world in general, and thus united the human to the Divine. Platonism is essentially the idea only of the outcome of a vision of the eternal Good; to Aristotle (herein outside of Plato) it was itself a kind of perfection, apart from any idea of the immortality—so Plotinus (Enn. i. 2) distinguished between an earthly and a heavenly Temperament. Yet there too the truths of Knowledge, and Justice. Yet the intention remained of seeking for the ultimate justification of moral goodness in an order which, while it includes humanity, is more than human.

With the development of the dualism between the individual and society Ethics had been raised above the question of the soul and the spiritual on the other, which may be said to have been the work of the succeeding period, there came the need to find some justification other than human nature itself for requirements which forced the claims of others in contrast to self, of the spirit in contrast to experience. The main source of evidence for modern Ethics is, in pointing to the idea of humanity, or of fully developed human nature, and the freedom of the individual soul, which is the origin of the use of societies and of the descent of the world to the bond of all social union—the condition of realizing a 'kingdom of ends'—but in it is to be found the revolution in the conception of individual soul of the previous centuries, as and as the nature of things. This note has its most powerful echo in this country in the course of the 19th century by which time the task of Carlyle, who taught that fidelity to duty is not only the one condition of inner peace, but the preserving presence of human society, and the way of access into the way of the power of creation. This doctrine at once carried Kant and his great English interpreter, and brought the naturalism of the Unitarian Ethics on the one hand, and the supernaturalism of the orthodoxy theology of their time on the other. Unfortunately Kant inherited the psychology of his opponents, which reduced all motives to forms of pleasure-seeking, and he could escape its results only by setting up in its place the custom of obedience to an abstract command of reason, while Carlyle had too great a contempt for the systematizing spirit of his time ever to seek a psychological foundation for truths which he regarded as sufficiently obvious to intuition.

The task to which modern Ethics has set itself may thus be said to be the justification of this trans-sentential idea in the light of the new conception. Of that Kant has to say (1) on the nature of volition, (2) on the standard of our judgments on voluntary acts, and (3) on the grounds that we have for conceiving of this standard. This with a condensed discussion of these three problems, under the headings of the Psychology, the Logic, and the Metaphysics of Ethics, is all that the present article can attempt.

III. THE PSYCHOLOGY OF ETHICS.—I. General nature of volition.—The recognition of the element of seeking or 'conation' as fundamental to consciousness may be said to be the starting-point of modern Psychology. What gives unity and continuity to conscious life, binding its elements together as a magnetic field binds the particles of loose metal which come within it, is a purposeful tension, appearing under two forms—in accordance as it is directed, and in the change in the character of the world. Metaphysicians have spoken of this fundamental factor as 'will,' but Psychology is wise in marking the distinction between mere instinctive, involuntary, and mechanical will, and the will towards a consciously conceived end, and in confining will or volition to the latter. It thus arrives at the definition of volition as the self-direction of a conscious mind, as the immediate function of that mind, whether in the content of the mind itself or in the

1 Ethics, x. vii. 8.

2 The only adequate treatment of volition in English is the series of articles in Mind, new ser., vol. x.—xii.
external world. In the form both of attention and of overt action, volition is closely related to feeling or interest, seeing that it is only on the basis of some intrinsic or acquired attractiveness in the object, some point of affinity between it and the psychic or psycho-physical structure, that desire can be initiated or sustained. There is no such thing as determination by 'pure reason.' Apparent desire, this feeling, is, as in the preference of duty to inclination, an indication of determination by inclination, not of feelingless choice. At the other extreme actions prompted by vivid ideas or temporary obsessions just cease to resemble volitions in proportion as the vividness comes from the accidental circumstances of the moment, instead of being, as it normally is, a function of a felt affinity between the object and the soul or psycho-physical organism. Whether we shall call the movement towards the source of this feeling in all cases 'desire,' or reserve that term for cases in which, owing to obstruction in the fulfillment of a conation, the object stands out as something merely possible in more or less painfully felt contrast to the present or actual, is a question of terminology. The essential point to notice is that objects attract, as Aristotle saw, οὐ διηλόγεις, or not at all.

2. The development of volition.—The development of will tends to the development of interest. It follows the line of growing susceptibility to objects which are more remote from the mere physical stimulus, and which correspond to a wider and deeper internal organization. The growth of the power of attention (g.v.) is the most obvious illustration of this. In its earlier stages attention is controlled by the merely mechanical pressure of presentations and ideas—their vividness, persistence, or attractiveness—will by their connexions of coexistence or sequence, and their superficial resemblances. We have the beginning of self-direction when the succession of presentations passes under the control of some idea of what is wanted, as in purposeful observation or recall. At a higher stage still the process is freed from all immediate reference to an external world, and becomes in the proper sense self-sustained, as in imaginative constructions or trains of reasoning. Intellectual education means the development of the power of the free exercise of the attention in such self-sustaining activities, under the guidance of conscience, of taste, and reasons of intellectual ends. This is rendered possible by the formation, in the mind, of an intellectual 'interest' or apperceptive system which acts as a principle of selective organization in the objects and ideas that come before the mind, and, as it gains strength, extends and deepens its influence over the flow of mental life. Such interests or dominant selective principles are not to be regarded as possessions of the mind, still less as forces acting from without upon it. They are what give character and individuality to a man's intellectual life, and enable us to speak of him in the proper sense as a mind at all.

Precisely parallel with these stages in the development of the 'internal will' are those which are distinguishable in the development of the will in the ordinary sense. Corresponding to the semi-involuntary control of the attention by the external world or by persistent ideas is control by impulse, pressing appetite, or the fascination of isolated practical ideas. What is characteristic of this stage is that it influences the idea of the self as a whole. Inhibitions and hesitations occur, but they are caused by the conflict of impulses with one another, rather than by the conflict of an idea, with which the mind identifies itself, with any or all of them. Selection and control come with the power of identifying ourselves with remoter objects, and bringing nearer objects into a form which may harmonize with their attainment. It is a further stage when these objects in turn become assimilated to the idea of the self as a whole, which thenseverely comes the subduing, organizing principle of a life. Such dominating ideas are not something merely of the self, possessed by the man, or rather they make him the man he is. They are his will and personality. It is only when they find expression in his actions that we account him fully himself. Where they fail, we set about seeking for some passing state, some accidental circumstance, outside the man himself, which, if it does not 'excuse' him, may give us the clue to the situation.

We have spoken of attention and overt volition as though they were two species of the same genus. But the connexion is much closer. They are rather to be regarded as the beginning and end of the same process. The condition of all action is attention to that which is to be executed. It is for this reason that, and not only because it is a power more general and owing to temporary absence of mind, though it ought not to be forgotten that even where the occupation of the attention depends in turn on the interest, instinctive or acquired, which attaches itself to the outer world as a whole, in itself, or as a means to some further end with which the agent has identified himself. Votition consists in the selective occupation of the attention by an idea owing to its power of serving a permanent interest, and is essentially 'presence of mind.'

3. Will and character.—The analysis of volition thus carries us beyond the single act to the volitional dispositions on which it depends. The totality of these dispositions in the individual is his character, and it is in this sense that we have in mind, by distinction from the volitions which go to form it and are the outcome of it. To the formation of will as thus defined a variety of factors contribute—inherited instincts, temperament or emotional disposition, circumstances both physical and social. But by far the most important are the reactions of the will itself to the suggestions which these supply, and the habits which thus become impressed upon it. Character has hence been defined as the habit of the will. It has seemed to thinkers such as Socrates and Rousseau that this definition is a contradiction in terms, seeing that character in any sense can only be a sense in which it is a value must involve freedom from the tyranny of habit. The difficulty is met, not, as by H. Bergson, by drawing a hard and fast line between motor habits which are correlated with cerebral action, and the free life of mind, but by noting the distinction between narrower or mechanical and the wider or, as we might call them, adaptive habits whose office it is to control them in the interest of life as a whole. In this sense Rousseau spoke of the habit of acquiring no habit, and Aristotle defined virtue itself as the habit of aiming at the mean. The above analysis enables us to add that these habits are, in the last resort, habits of attention. They concern, not how, by practice in adapting conduct to embracive ends, the habit of being controlled by these ends—in other words a moral character—may be acquired.

4. The social will.—In the older psychology, which conceived of pleasure or the avoidance of pain as the single ultimate motive, objects of social value could enter into the content of the will only in so far as they are included in the idea of the self as a whole, and so as means to the furtherance of that end, or, through the principle of association, come to be mistaken for it. It was an advance on this individualistic psychology when it came to be seen

2 See Stout, op. cit. 1. 104.
that the experience of pleasure presupposes instinct and desire, and the social instincts were
admitted the theory of at least equal importance
with the self-preservative or self-assertive. It
was a further advance still when it was recog-
nized that the social instincts are merely vague
tendencies from the filling and the minding
which they receive from contact with the developed
life of the society into which the individual is born.
Just as mental development depends for stimulus
and guidance on the social system, and, more
particularly, on the social institution of language,
so the development of will depends on the assimila-
tion of the purposes represented by social institu-
tions and customs. There was then no longer any
difficulty in understanding how corporate ends, e.g.
family life, which satisfied deep-rooted instincts
and claimed attention from the first, should pass
into the structure of the mind and become objects
of interest in the sense explained above of at least
equal standing for that of the more personal.
Moreover, it was no longer necessary to
conceive of the individual and the social as lying
outside of each other and requiring to be linked
logically in a system of what Dr. 'association.'
Their continuity and interdependence were a mere
matter of ascertained fact. 'The individual self
and the community are not centres of different
circles; they rather hang, like the two faces
in relation to which we may describe the course
of human activity. 1

So far the facts seemed plain. But, on the
further questions of the precise description of
the process of assimilation and the resulting content,
'social' psychologists were by no means so clear.
With respect to the former question, it was prob-
elly the genius of G. Tarde which first effectively
directed attention to this part played by imitation.
Other psychologists, such as Baldwin, were not
slow to follow and apply the principle to explain
the appropriation of the purposes and the feelings of
others and the development of the individual into
a social. 2 With respect to the second question, the
current view of what is meant by a universal
led to the interpretation of the result as a mere
reproduction of the same content in an indefinite
number of individuals. A closer analysis of what
is meant by imitation seems to show that—except
in the case of the children's game, or the savage's
exaggerated respect for precedent, of which this is
perhaps itself an imitation—imitation in the strict
sense plays hardly any part in social life.
Even where the suggestion comes from the
action of another, and not from the requirements
of a situation, there is adaptation and invention;
the suggestion is what Stout calls 'relative.'
Where, on the other hand, it is the situation that
works, as in reeling a sail or felling a tree (and
this is the typical 'social' case), what we have is
co-operation and not imitation. Similarly, what
is called innovating result of imitation, even where
this is prominent, is not the seeing as another sees,
or the feeling as he feels (out of this no society
could develop), but the formation, in the individual,
of the spirit of the age, in whose life he con-
tributes, not by doing as another does, but by
doing something which is suggested to his own in-
ventive imagination by the situation in which he
finds himself.
In which has just been said we have kept strictly within the
limits of Psychology, but beyond the psychological problem of
the will and the individual lie the philosophic, and as one of the
reality in society of a will which is not something entirely outside the individual, but whose life he contributes,
not by doing as another does, but by doing something which is suggested to his own inventive imagination by the situation in which he finds himself.

2 See esp. Mental Development in the Child and the Race,

5. The freedom of the will. It is unlikely that
so important a transformation in psychological
theory as that sketched above should be without
bearing on the question of the freedom of the will.
So long as the point of view of Psychology was
identified with that of the physical sciences, we can
understand how there must have appeared to be an
impasse between Psychology and the assumption
on which all judgments of merit and demerit and
of moral and immoral action rested. So soon, on
the other hand, as it was recognized that the
central fact from which any true psychology must
start is the idea of a progressively designed
brauch in the human organism, the question was
reopened whether it is possible to harmonize
the findings of science and morality.
Even from the point of view of Biology it ought
not to be difficult, except we have already
an innate prejudice in favour of the exclusive
validity of the categories of the inorganic sciences,
to admit that to render the facts intelligible they
must be seen with other eyes than those of the
physician or the chemist. Life depends on the
storage of physical energy, it maintains itself in
and through a system of mechanical strains and
impacts; but these are taken up into a scheme
that goes beyond them; and, in so far as this is so,
the life of the humblest plant is free in a sense
denied to the motions of the heavens. * A fortiori
all this is true of beings who not only live but can
make their life an object—.\ew to adjustment
and determination from within can add determination by the idea of the self. Self-
conscious mind is still subject to the laws of
inorganic matter and of mere life. In the
instincts and appetites which it inherits, in the habits which
it acquires, it carries about with it a system of
forces which, while they stimulate and give stability
to its life, constantly threaten its own peculiar
nature. Yet, so long as it bears the burden of its
own human purpose, it contains a principle
that enables it to turn all these into means and to
vindicate a new form of being, which is free in the
still higher sense of having the power to set every-
thing else, even its own freedom, over against
itself, and to convert it into an instrument of self-
development. Such freedom will be more or less
complete, according as more or less of the insight
which experience has brought as to the meaning of
the life and it calls for development is embodied in
the action—in other words, according as a man
lives more habitually and consistently in his deepest
purposes and is more completely self-denied.
What must be added to this must be added is
in this conception, which we might call that of 'degrees of freedom,' we have a
point of view from which the old controversies may cease. As against the old determin-
ism and the does of the eighteenth century, at least.
In conception and inference, this new idea is, first, it asserts its
freedom from the pressure of what is merely external, whether
in the apparent consciousness or the persistence of the
of the will in the individual life. In the old determin-
ism we must admit that reason is free. In Locke and
denied. In conception and inference, this new idea is, first, it asserts its
freedom from the pressure of what is merely external, whether
in the apparent consciousness or the persistence of the
of the will in the individual life. In the old determin-
ism we must admit that reason is free. In Locke and

1 Political Theories of the Middle Age, Cambridge, 1900. For
an account of the various forms in which the reality of the general
will has been conceived, see H. J. Smith, Interpretations of Society,
saying, as he does, that he 'could not conclude otherwise,' the reasoner asserts not his bondage, but his freedom. It is only apparently different in conduct. True, there is commonly a wide gulf between seeing what is reasonable and giving effect to it in action than between seeing a logical consequence and accepting it. But only because living is a more complex business than thinking. The principle is the same. The will is a complex force in individuals more than in society, (a) in collecting itself for rational decision, (b) in refusing to allow itself to be diverted from its resolution. As such of these points in individuals, and (c) in the absence of habits and associations over which it has no direct control. But at each point also it is more than any of these habits, and has the possibility of varying something more as its guiding principle. Just in proportion, moreover, as it does so feel it at the moment of action that it could not do other than the thing. But it does so feel on that account excuse itself for the result; on the contrary, it is all the more ready to accept the issue as its own. Responsibility, in a word, grows, like freedom, with the extent to which our conduct has been forced upon us as the only free expression of that desire to be. If the question is still pressed upon us whether in actual fact it could have been different, the answer is at once No and Yes—No, if he be meant that the agent being what he was, his conduct could have been other; Yes, if it be meant that his character was no inevitable result of a history in which moral purity, individual and social, has failed to enter as a controlling factor.

The consideration of the implications of our judgment of moral approval and disapproval and of the principles underlying punishment will be found to support these conclusions. It shows that in case most favourable for moral judgment, viz. that of one's own actions, what gives remorse its strongest impulse is the fact that I have done the thing, not that I am in such a character as to be capable of doing it. If I could persuade myself that the action was possessed of the deepest features of this disposition, instead of being an accom of condition, as it ought to do on the libertarian theory, would bring a few tears to my eye, but would not be more disapproving to that which they disapprove. I discovered that I had done it in my sleep, or had not done it at all. Similarly with respect to the phenomenon of punishment in the reaction of society against the offences of the individual, and is justifiable only on the assumption, first, that there is a real connexion between action and character; second, that through reform or 'example' it makes for better character in the offender, the community, or by both.

The discussion of this controversy as to free will, that to the relation of pleasure to desire, if not actually an anachronism in the light of recent analysis, is in the fair way to become so. It follows, from what has been said of the dependence of all conscious processes on the pre-existence of dispositions with which presented objects are in felt harmony or discord, that without feeling there can be no volition. In this sense, we might accept Mill's dictum, that 'desiring a thing and finding it pleasant, aversion to it and thinking of it as painful, are phenomena entirely inseparable, or rather two parts of the same phenomenon (though for the present I shall live without the distinction 'with pain'). But, since Mill wrote these words, the distinction between the idea of a thing and the idea of the pleasure to be derived from it has been further amplified; and, seeing that these are clearly different phenomena, it seems obvious that to desire a thing, and to desire the pleasure we expect from it, are not one and the same phenomenon, but are entirely separable phenomena. The recognition of this distinction may be said to have rendered the older form of hedonism no longer a tenable account of the nature of will and desire. It can no longer be maintained that it is the pleasure-seeking quality of things that makes them objects of desire.

Of the existence of the type of character known as the pleasure-seeking type, there can, of course, be no question; but the pleasure-seeker gets his name not so much from his identifying himself with pleasure in the abstract as from his habitually identifying himself with whatever kind of pleasure he finds, little claiming that the pleasure and pain connected with them are their most striking attributes. In the line of least resistance, and runs his life on the cheap. The normal man has acquired, through education, sufficient strength of character to resist the temptation, that is, to maintain his independence by a reference to the concrete interests with which he habitually identifies himself, and to face the weight of argument involved in banishing contradictory suggestions. The mind of the pleasure-seeker, on the other hand, is like a stinking without a green rear in which the stench is more sweet unresolved, because of his inability to face the effort required to sustain an inhibiting idea in the centre of attention.

not that he seeks or finds the greatest pleasure in the things he chooses, but that he fails to find sufficient pleasure in anything.

This conclusion is confirmed by recent criticism of the second of the ordinary doctrine of pleasure-seeking, viz. that pleasure operates as a motive in proportion as it is felt. It is generally supposed, viz. that 'to desire anything, except in proportion as the idea of it is pleasant, is a physical and metaphysical impossibility. It is a well-known law that the feelings of a pleasure-seeker, under a law of continually diminishing emotional returns and yet of continually increasing motive pressure. Recent hedonism has sought to accommodate itself to these criticisms by maintaining that they are irrelevant to the main contention, which is that it is their pleasure-giving quality, and not their felt relations, that will make them effective, that gives value to things. But, while avoiding the difficulty of identifying the object of desire with pleasure, this reading of the doctrine conceal the true theory, viz. that Psychology that pleasure is a function of, and not need of pleasure. The satisfaction of felt experience, and not the degree or amount of the pleasure, while it may be a gauge of the momentary presslessness of the need, can never be the standard of the worth of a thing. On the contrary, the worth of the pleasure must follow worth of the need, of whose satisfaction it is the sign.

7. Conscience.—The justification of the pressure which conscience (q.v.) exercises upon the will is a question of Ethics in the stricter sense of the word. The Hedonistic is the precise nature and origin of the feeling of constraint which the word represents belongs to Psychology.

The will, we have seen, is identical with the disposition to be dependent upon harmony with the dominant practical interests, and to be repelled from things which are in contradiction to them. From this it follows that these centres of practical interest, whatever they may be, must have the power, either separately or in conjunction, of exercising a certain pressure upon conduct in so far as there exists a consciousness of its general bearing in furthering or obstructing the purposes they represent. In reference to each of them there is a line of conduct which approves itself, another which disapproves itself. Wherever we have such a centre we have the conditions of such a feeling, the degree of pressure thus exercised varying in proportion to the depth and permanence of the interest concerned. The feeling of harmony or discord of conduct with a ruling interest is, in fact, a rudimentary conscience, and by a suggestive use of language is sometimes spoken of in this way. In this sense we hear of the craftsman's conscience and the student's conscience—even the miser's conscience, which makes the profitless expenditure of a sixpenny-piece a positive pain. What differentiates conscience, in the distinctly moral sense, from these conceptions is merely the depth and the permanence of the interest in which it has its roots. If the reader is inclined to resent such an account as a cheapening of an element in human nature which he has been accustomed to regard as its highest manifestation, the reply is the same as that already given in regard to the will in general. In seeking to exclude an element of the human soul, as far as it is not involved in banishing contradictory suggestions. The mind of the pleasure-seeker, on the other hand, is like a stinking without a green rear in which the stench is more sweet unresolved, because of his inability to face the effort required to sustain an inhibiting idea in the centre of attention. His characteristic is, 

1 Utilitarianism, p. 53.

2.1b.
recognition of a conscience in sensu eminente to
to a pre-eminent interest, of the pressure exercised
upon conduct in general by any interest whatsoever.

The nature of this conception is, as we have seen, a question for Ethics
proper. Psychology is concerned with the means
and order of its development. It seeks to make it
understandable, to give it a form, to acquire it instinctive pressure from within, and finding its
counterpart in established custom without, the
tribal self comes to dominate every other, mould-
ing the individual into a homogenous system of
habits—mores or sifting. In its subsequent develop-
ment this 'morality' follows in the track of the
developing self-consciousness in general. A definite
stage is reached when the social spirit brings forth
heroes and founders, who not only enoble in
their own lives conspicuous forms of social excel-
ence or 'virtue',1 but possess the insight of genius
into the significance of virtue in general, and are
able through individual prestige to give it firm
roots in national life. Thus 'Catholic souls', as
Plato2 calls them—parents of virtue of every
kind—become thenceforth, through the force of
suggestion, a living law or conscience to the
nation to which they belong, by another stage when
the demand arises to have usage and inherited
authority defined and restrained by written law.
But it is not until, owing to the growth of reflexion,
the social bearing of different types of moral char-
acter comes to be realized, and their goodness
becomes transparent in the light of the social well-
being they serve, that we reach the highest form
of social conscience. Virtue is thenceforth know-
ledge, or at least implies knowledge. Actions and
types of character at first approved because they
have the stamp of authority, law, or custom come
to be approved for their own sake. Yet the same
work principles throughout; there is no real break
anywhere. Just as Logic works obscurely in the pro-
cess, by which we accept our beliefs from ordinary
sense-experience or common hearsay, so morality
works obscurely in the earlier manifestations of
social solidarity. Fear is the beginning of
knowledge, because there is more in it than fear. And, just
as the progress of belief is best represented as a
continuous process by which the false is separated
from the true, and causal aporia and accidentally
received belief are inferred to be light phenomena
in the light of organized science, so the progress of moral feeling
is to be conceived of as a continuous development
from unconscious acceptance of tribal custom to
the enlightened citizenship or humanitarianism of the
patriot or the philanthropist.

IV. THE LOGIC OF ETHICS.—I. The idea of

a logic of moral value, more than once appealed to
in the preceding paragraphs, is contrary to two
widely held but opposite ethical theories. On the
one hand it is maintained that none is needed, on
the other that none is possible.

(a) The development of morality, it is held, is the
result of natural selection. Once a society
understands how in the inter-tribal struggle for existence a form of
character in individuals has been developed which favours survival, and you have an answer—the only
answer needed to the question of the ground of its
authority. Character is good because it survives, it
does not survive because it is good; de facto is
de jure; its might is its right.

After what has already been said as to the
development of will, we shall not be accused of
under-estimating the value of the history of moral
ideas. Conscience, like everything else, stands in
relation to historical fact, but it is, in its essence,
as we have seen, a form of self-consciousness, and,
as such, claims the right to test the fact by its
relation to the self. It is for this reason that the
appeal to nature (as the name for what actually
exists) must remain unconvincing. Unless it can
be shown, apart from the actual course of develop-
ment, that there exists some essential relation
between social solidarity and the rational element
in human nature, in other words, that will obeys a
logic of its own, and is not merely something
merely individual, it is difficult to see on what
foundations our judgments of value and the
feeling of obligation which depends on them, can
rest.

Darwin himself noticed the difficulty of explain-
ing, on the principles of natural evolution, the emo-
tions that lead to philanthropic efforts to preserve
the weak. More recently W. James3 has called
attention to the feeling of the inward dignity of
certain spiritual attitudes—serenity, simplicity,
etc.—as quite inexplicable except by an innate
preference of the more ideal attitude for its own pure
sake. To this it might be added that, as a matter
of history, there is the circumstance of light, dis-
in nations which had already been absorbed by
conquest, and had long ceased to compete effect-
ively for national existence, and to have com-
manded the official attention of an author like
James, who, judging by his own perceptible
utility as a condition of survival, but by their
consciousness with the general aspirations of
mankind after spiritual unity. Psychology, indeed,
seeks to make it comprehensible how, through the
influence of habit, association, imitation, our ad-
mirations deepen and extend. In this way means
are transformed into ends, qualities come to be
admired for their own sake, and perfections to be
sought after, which are to us the end in itself, a
practice to other. But these considerations, how-
ever useful in explaining the origin of these
similar sentiments, still fail to touch the main
difficulty—the justification of the right they claim
to be regarded as of superior order, and, as such,
to control our conduct. Granted that they exer-
cise that pressure on the coarser and more selfish
instincts which we call the authority of conscience,
by what right do they do so? What gave them that
authority?

(b) An opposite line is taken by writers who,
while insisting that actual fact can establish no
right, maintain that we can have no ultimate
standard by which to judge good or evil. The
experience of good, like that of blue or yellow,
is an ultimate datum of which no definition is
possible,4 and none is needed. A theory like this
is not, of course, to be met by denying the place of
immediate experience in moral judgment. Where
it errs is in taking immediate feeling as an ultimate
instead of merely as a starting-point. It is true
that our practical as well as our logical and aesthetic
judgments are rooted in quite definite and unique
experiences. But no one maintains, as regards
our logical judgments, that the matter ends there.
Even in the simplest case of sensory data, such as
colour, there is a degree of solidity, distance, contrast, etc., to be taken account of before we
can tell what it is that we experience. If it is,
according to a popular way of thinking, different
with regard to 'tastes,' this can be seriously main-
tained only on condition that we are prepared to
deny all value to aesthetic criticism—ultimately
all essential difference of value in forms of beauty.
And, if it be true that there are standards of truth
and beauty, it can only again be at the price of
denying all unity to human nature that we deny
a like standard in the case of moral goodness.

It is impossible, in an article like the present, to

1 See Weil, Philosophy of Law, sect. 150.
2 Symposion, 350.
3 See Will to Believe, 1901, p. 167 (1st ed. 1897).
4 Good is a simple notion, just so yellow is a simple notion.
5 Good is a simple notion, just so yellow is a simple notion. (G. E. Moore, Principia Ethica, p. 1).
draw out this fundamental analogy with anything like the completeness which it deserves. It must suffice to take the leading points which emerge from a consideration of the underlying structure of our logical judgments.

1. The position here is the search for a criterion of truth, philosophy is constantly brought back to this if it cannot con-

(Continues)
and our moral ideals in the respect referred to. It is, of course, true in general that we have to wait the judgment of experience to confirm our appeal to the ideal; 'das Weltgeschichte ist das Welt-
geschichte der andere,' but it becomes more and
more possible, as sensitiveness to moral distinc-
tions develops and the ethical consciousness be-
comes clearer, to perceive what is implied in ac-
nowledged principles. Such principles have com-
monly been made by the great legislators and
reformers of the human race, whose efforts have
much more frequently been employed in developing the
logic of principles already accepted than in estab-
lishing new ones. Nor is there here any differ-
ence between the movement within particu-
lar ideals and that which carries us from one to the
other. Where, for instance, to take Hölderling's
own example, can any line be drawn between
progress within the family ideal and progress from
the ideal of a strong domestic to a strong political
consciousness? What holds of different levels of
the social ideal holds also of the spiritual or sup-
social. Thus, it illustrates the 'political' life and the life of science, art, and
religion. Closely regarded, the latter come more
and more to appear in the light of a continuation of the concept of wisdom begins, fulfilled
utterances of the same universal self which the
general will reveals in more precarious forms, and
in the same way implicit in the consciousness of
every individual.  

The second criticism, in like manner, seems to rest on a misunderstanding, of which the analogy of
Logic again suggests the correction. The ideal in
Logic, in general, is a world of completely
coherent ideas; yet, in any particular investi-
gation we are concerned, not with this ideal in the
abstract, but with carrying forward the mind's
work of organization in response to the summons
of a particular theoretical situation. The particular
point on which attention is concentrated may be
wholly insignificant in itself, bearing no obvious
relation to truth as a whole, or even to the body
of accepted truth in the particular department.
Yet the concentration takes place on a general
background of conviction that the problem itself
is a rational one, and continuous with the general
presuppositions of science, by which, in the last
resort, the results of the discussion must be tested. So
in practice. The call for moral conscience comes from
particular circumstances, without obvious relation
to wider ends, and may be met without conscious-
ness of anything in particular that depends upon the
choice of what gives final value to the action. The
choice is that it is rooted in the moral order,
which it sustains in equilibrium, or that it carries
us perhaps unconsciously to a higher plane.

'Sense' could be appealed to in conduct, as in
belief, only where the issue is so insignificant that we may 'do as we like.'

3. Other definitions.—A reference to one or two
of the classical definitions of the moral standard
will serve to rest the somewhat abstract statement of it to which we have been led.

(a) The mean.—Aristotle's doctrine, that virtue
or excellence is a mean, stands in express relation
to his theory that life is developing system of
harmonomic activities. There is, indeed, an inter-
pretation of the mean which suggests a compromise
between opposing elements rather than the union
of them in a harmonious whole. But that this is
not the interpretation which Aristotle intended the
definition is evident, not only from the emphasis he
lays on the 'relativity' of the mean, but from the
analogy of the arts, which, in spite of his dis-
claimer, really underlies his whole discussion.
What Aristotle has in view is the limitation im-
posed on the passions and desires, not by any arti-
ficial average or working compromise, but by the
ideal form of individual life. As the artist works
at the parts with his eye upon the whole, so it is
the form of the individual. If the individual
must have in view in fixing the limits within
which particular impulses and desires may find a
place. The order, however, as the latter part of
the definition indicates, may be a very
individual one. The standard is not to be looked
for in the broken outlines of the lives of ordinary
people, but in the best type of humanity, the 'wise
man,' who represents in the fullest manner the
un-broken continuity of individual, social, and spiritual
existence.  

(b) Personality.—While the harmonious adjust-
ment of the elements in man's nature—material
and spiritual, individual and social—is the key-
note of classical Greek Ethics, the manifold
obstructions to it, which to the next generation
seemed to call for a withdrawal from what is
irrelevant and for concentration on the relevant,
tended to shift the same concrete purpose to the
individual, from citizenship to independent person-
ality. True as this conception is when rightly
interpreted, the ambiguity which surrounds it
has proved to ask for the help of a more subtle thought in
the material world, but even from the qualities
and capacities through which the will itself finds
expression: 'I am what I am; all else is mere
accident and limitation.' But only a formalism
such as that which was the chief share of the
Stoics could seek for the moral standard in such
an abstraction. To be a 'person' in this sense is
to be the least that we can be without ceasing to be
human; 'something,' as it has been called,
'contemplative in the very expression.' We reach
a more concrete, though still a partial, view of
personality when we conceive of it as the self
which, in virtue of the material separation of the
body and other forms of 'property,' has claims
against other similar selves. It is the prominence
assigned in modern times to the rights of person-
ality in this (which is necessarily an exclusive)
sense that has given rise to the exceptions of the standard of ethical value. Hegel's
motto, 'Be a person, and respect others as persons,'
limited by him to the field of abstract or legal
right, is taken by the individualist as equivalent to
the highest expansion of the moral conscious-
ness. It is only when we come to a third sense of
the word—which includes the other two while
differing from them—that we can accept this
equivalence. Giving meaning, to the power we
have of separating between ourselves and our
conditions (including the various elements in
our own nature), there is in every rational being
the power of moulding them into a definite form for
the furtherance of some concrete purpose to our
interest. Giving meaning also to the capacities
of mind and body, and to the material objects
which are their instrument, and justifying the
claim the individual puts forth, that the
use of them, there is the capacity of permuting
them with a life which is not merely individual
to himself, but unites him with others who have
a joint interest in their utilization. If we call this
attitude of purposeful 'personality,' we can see
how it is realized, not in proportion to the
extent to which concrete interests are excluded and
the individual atomized, but in proportion
as particular interests find their place in some

1 Bosanquet op. cit. p. 333.
2 See Bosanquet The Principle of Individuality and Value London, 1912, App. II.
universal and inclusive interest, whereby the individual enters sympathetically into the spirit of the whole of which he is a part, and is thus raised above himself.

'Personality,' says W. Wallace, 'presupposes within us a moral principle which, from the beginning, gives to the individual a potency of uniﬁcation of interests and principles, and which can, occasionally at least, raise that potency to an actual position in society. ... Without us, that would be a system of society in each where has his place appointed, and through which he is bound to a special restricted purpose; but still, while occupying that place, his inner and moral personality must remain intact. He is no doubt a mere unit, but a unit which can create and produce in himself the whole society of which he forms a part.'

(c) My station and its duties.—In view of this statement of the full meaning of the principle of personality, we can understand how the latter element in it should have come in recent Ethics to be made the head of one corner. 'To be moral,' says Bradley, 'I must will my station and its duties.' Though associated with a reﬁned form of idealism in Bradley's writings, this takes us back to Plato's homely deﬁnition of virtue as ἅρμα τῶν ἰδρῶν. There is, however, this difference between the ancient and the modern deﬁnition—namely, that it is accepted by Plato only on the assumption that society has undergone a transformation which has eliminated the element of accident that plays a large part in Kight's or our places to individuals. It was possible, indeed, for a former time to conceive of a man's station as assigned to him by a deeper Wisdom that knew man's needs. But, interpreted in the modern spirit, there is nothing to be held the element of naked accident to which most of us owe our station and function in life, and which makes all talk of a secret harmony, where it is not treason to a better order, in nine cases out of ten an obstructive form of its. The difﬁculty can be met only by a return to the Platonic, which is also the modern democratic, point of view, and which conceives of the fullest life alike for individuals and society as attainable only by assigning to each the place which his own developed capacities best enable him to ﬁll.

Even so the difﬁculty remains for us as for Plato, that at its best the idea of a 'station' suggests ﬁxity and exclusiveness, and in its very terms spells external pressure and spiritual imprisonment for the great mass, and particularly for the industrial part of society. Although no one is likely to claim that the practical difﬁculty which a period of mechanical industry like the British induces by reference to abstract philosophical theory, it is yet important to realize that it is, to a large extent, the result of the modern idea of fullness of life and concentration upon one or other of its particular phases. The assumption that comparative happiness is identical with multitude of interests and pursuits is a mistake parallel with that of assuming that fulness of life is achieved by the mere knowledge, and is open to the same correction. As is the depth with which a man realises the scientiﬁc spirit in a particular ﬁeld, so the variety of his intellectual interests, that is the measure at once of his work and of his satisfaction in it, so is the depth and intensity with which he realises his particular social obligations, not the multitude of the functions he performs or the area he covers, that gives meaning and fulness to his life.

V. THE METAPHYSICS OF ETHICS.—Tempting though it is to pursue the social applications of ethical principle suggested in the previous sections, it is here more important to follow the philosophy of its subject to the point where it connects with the problems of religion.

It was with a true instinct that Kant perceived that, however separable metaphysical problems might be from science, they were bound up with the very existence of morality. Like the corresponding problems in the theory of knowledge, they may be condensed into two. (1) As the recognition of the relativity of human knowledge raises the question of the ground of knowledge, we claim that the world responds to the claims of our intelligence, in other words, is knowable at all, so the discovery of the relativity of ethical ideals to social well-being raises the question whether they are applicable beyond it, whether they ﬁnd any support in the actual course of the world as a whole.

(2) As behind the question of the knowledge of the world there lies the question of the kind of reality we must assign to the world of goodness, so behind the question of the goodness of the world there lies the question of the kind of reality we must assign to the world of goodness.

I. Is the universe good?—To make clear to ourselves the precise form in which the ﬁrst of these problems faces us to-day, we may start from Kant himself. In answer to the question, What is the foundation of our faith in duty? Kant, as is well known, appealed to the reality of the supersensible source from which its imperative issues. But, when it was asked, in turn, on what our belief in this reality rests, the only answer forthcoming was that a categorical imperative is inconceivable without it. To this it seemed sufﬁcient to reply that the alternative to which Kant sought to shut us up is one in which, after the reality of a supersensible goodness or the unreality of the categorical imperative—does not represent the situation. There is a third possibility, we may say, that morality with a system of absolute imperatives. It is, indeed, impossible, as Kant saw, to base morality on self-interest. But the imperative that overrides the maxims of self-interest carries us, it may be urged, to no absolute Being containing in himself the conditions of the union of Nature and human life, of happiness and virtue, but only to the relative being of human society. Like the world of scientiﬁc knowledge, Kant's own showing, has a claim to no more than hypothetical truth, the moral world is founded on a hypothetical, not on an absolute, imperative: not 'Do this, though the heavens fall,' but 'Do this, as you would have social life upon earth.'

This may be said to be the criticism which, in the next generation, Comte passed upon Kant, the Positivism of France upon the Formalism of Prussia. Its effect was to sweep away the point of contact between the supersensible and the sensible, which Kant thought he had discovered in morality, and to carry into the moral sphere the break between the reality of things and the formal understanding of them which has sought to establish in logical theory. Man's life founded on the conception of a good which realises itself in an organism of social activities appears as something rounded off into itself in a world in which stands an essential incongruity to its ideals, and contains no pledge of their fulﬁlment, but, on the contrary, so far as we can see, after engendering them dooms them to ultimate disappointment. With Positivism the main issue of modern Ethics came into view.

An exhaustive criticism of the theory is here out of the question (see POSITIVISM). The question it raises is whether the logic which enables us to see that the individual owes all that he is to the unconscious co-operation of society ought not also to convince us that the being of society is rendered possible only through the co-operation of the universe as a whole. It is quite true that it is the conflict with one's own inward and inward forces that all that is of most value in human life has been achieved. Philosophy is wrong if it seeks to minimize the evils of earthquake and pestilence, war and social injustice, as picturesque shedding in the best of all possible worlds. It is within its right when it in—
sists that the good which we know and value is conceivable only in a world governed by just the laws of nature and mind which we can illustrate. So obvious is this extension of the logic of Positivism, that we are not surprised to find the opposition of cosmic forces recognized by Comte himself as a necessary condition of human development. Without it, he tells us, 'man's feelings would become vague, his intelligence wanton, and his activity sterile.' If this yoke were taken away, the problem of human life would remain insoluble, since evolution would never conquer egotism. But, assisted by the supreme fatality, universal love is able habitually to secure that personality shall be subordinated to sociality. The surprise is that, having established this relation between condition

2. Is there a higher in the universe than goodness? In order to establish the supremacy of the Good, the appeal, we have seen, is to the standard of inner coherency. But, having established before this court its rights against its enemies, the bad and the imperfect, the Good has to face the tribunal on its own merits; and recent criticism has not been slow to point out the flaw in its own case. In its efforts after self-expression the will seeks to include all the elements of life in one harmonious whole. The life which we judge to be truly good must, on the one hand, be all-inclusive, and to this end must even be expansive, and on the other, it must bring its powers and possessions into harmonious relation with one another, and be at home with itself. But, however logically inseparable these two requirements may be, they manifest themselves in reality as two separate ideals: on the one hand, the ideal of self-sacrifice (whether this be to persons, as in altruism, or to impersonal objects, as in devotion to science or art); on the other, the ideal of self-realization. And these are, in the last resort, the two sides of human life, the two faces of the same coin. And it is this duality which makes this problem untouched.

3. To find the solution of this problem, we must distinguish between, on the one hand, the idea of the universe as a harmonious whole, and, on the other, the idea of the universe as a world which, while harmonious, is not complete, but is in a state of incomplete development. Both these ideas are compatible with the idea of the universe as a world which is in a state of incomplete development. Both these ideas are compatible with the idea of the universe as a world which is in a state of incomplete development.

4. It is not surprising that consequences thus uncompromisingly deduced from idealist principles should be opposed by the ethical protest. Not only did they run counter to ordinary opinion as to the supremacy of morality; they seemed to threaten the very springs of action. If all we call good and bad is but a passing shadow on the screen of time in a reality itself timeless and self-contained, human enterprise and effort seem to be doomed to fatality. All aspiration after the freedom to plan and to achieve is faced by the sphinx-like calm of a universe already at peace with itself and secure against all innovation. The signal for the revolt against these apparent deductions was given by W. James's Will to Believe, which for the brilliancy and irresponsibility of its attack has no precise parallel in modern philosophy, except the better known and equally favourite of the heart against the deadening weight of Kantian formalism. It was followed by a wave of wide-spread reaction against the idealism of philosophy, expressed in the names of Humanism, Personal Idealism, Pragmatism (p. 92), as it is yet further from existentialism. What is common to all these names is the attempt to restore flesh and blood to the ghostly make-believes which the older Idealism was supposed to have left to do the work of human purposes, and the insistence on that end upon movement and process as constituting the life of things, the openness of the universe to all kinds of unstrait interpreta-

5. It is not likely that so vigorous a movement springs wholly from ambiguous words. Yet it is certain that the movement is possible until the ambiguities which attach to such central ideas as 'appearance,' 'process,' 'purposive activity' are removed. With regard to the first, the distinction between appearance and illusion is, of course, vital. Because a thing is not in the real sense of the word, it does not follow that it is an illusion. In illusion we take something to be what it is not; an appearance is that which cannot be taken simply as it is. It is true, to take the sun rising for an actual movement of the sun and the earth's rise; the rising itself is, on the other hand, an appearance which, before it can be taken for reality, has to be supplemented by other facts which in explaining transmute it. Without itself representing the whole truth, one concept may be nearer to it, i.e. include more of the facts and stand for a more harmonious combination of them, than another. From this it follows that to deny ultimate truth is compatible with recognizing a high coefficient of relative validity. This is the logical equivalence which is true of every concept. It is that degree of reality which might be better called 'degree of validity.' It may be summed up in the propositions: every- thing which is at all must have a basis of some kind in the inner unity; short of itself being the whole, this unity, just as for that reason the other, is incomplete and must be incomplete and break down in contradiction; this point is more remote according to the degree of inclusiveness and harmony which the concept represents; but ultimate truth or relative validity, nor does it prove that the whole could be what it is without the relatively invalid part. Returning, with this distinction in mind, to the case of willed action, it is true that will rests on the distinction of an actual and an ideal, a now and a not yet, and must partake of the unrest of that relation. So far as it does so, it falls short of the highest reality. On the other hand, will represents a high degree of concreteness and internal stability. In it, as we saw, the elements of the inner life find their unity. It faces and breaks through the self and not-self, uniting itself with the external world in the works and institutions we call civilization, and in the long run yielding place to nothing that does not come forward as a deeper and broader sign of the same self and not-self. So the reality of blind instinct and desire, so, we have seen, morality is the reality of the will. In morality will comes to its own, and is at one with itself. But it does not come to this in a world which, at the end of time, has no other reward for the faithful than the opening up of a further vista which dwarfs present achievement and dooms one to a renewal of the conflict at a higher level. This does not
prove that morality is an illusion, or that it rests upon a make-believe. It merely proves that it is not the highest form of experience. Above it stands reality—what it means to realize in which morality ends, and seeking to heal them with the conviction that the aspect the world presents to the good will is not the final and only reality. Yet we must again add that, though transformed, morality is not destroyed. It does not simply fade out of the religious consciousness. It survives in religion as it survives in fine art, giving substance and significance to what otherwise would be a vague and meaningless mysticism, and, so far as it is the immediate basis of the form of consciousness that seems to be the most real of our experiences, itself partaking of that reality.

With this account there seems no reason why idealists of all types should not so far agree. Even pragmatic or 'personal idealism' might be willing to accept it as another way of putting its own contentation that the real is that which serves a purpose. It may be that any particular form of human experience may be unsatisfactory without therefore being valueless, and how one may be of more value than another. On the other hand, we can understand how it may still seem to be an intangible element of the whole system of relative reality, or, if it be preferred, relative experience, to the absolute reality or the absolute experience. It is here that the pragmatist sees his opportunity to press the question, 'Why hamper ourselves with an absolute at all, which serves only to stultify our previous results: Is the relative and the finite a necessary element in the absolute and the infinite? Then the latter itself becomes an irreconcilable contradiction, a seed of unreality into the heart of our all-real. Is it, on the other hand, unnecessary? Then is the real altogether real, the whole together complete without it; movement and purpose are, after all, illusion.'

There is, we believe, no other way of meeting this difficulty than by insisting on a clearer statement of what is meant by process and creation. If it is an error to represent reality in terms of fixed entities, like the popular conception of the Platonic idea, it is surely no less an error to represent it as mere change, though that be the change of a conscious will and intelligence. What it gives value to life in general, and to the life of mind and will in particular, is not that it initiates change and novelty, but that in the change it maintains the relative and unchangeable relations of participation in which is the condition of its own self-maintenance. This means that there are differences of reality in purposes themselves, according as they embody more or less of the unity of the whole of which they are parts. But to recognize this is to recognize that all time-process gets its value from a relation to a whole or ideal which cannot in any intelligible sense be said to be itself a mere series of processes. It is eternity.

In asking pragmatists to admit this, we are, in fact, merely asking them to realize more fully the meaning of their own contention for the abandonment of the Socratic notion of reality as a matter, in favor of that of subject. This is the true Copernican revolution in philosophy, must carry with it a far more thorough attempt than is yet common, to substitute the idea of mind over all things, and, again, to add to the idea of things and their attributes. Thinkers of both camps may reasonably be asked to apply more courageously the notion of self-conscious life as the idea of things not of process of progress—of thought and will alike as finding their reality not in mere movement but in more fully organized, and thus more deeply established, forms of self-expression. So regarded, the true conception of the infinite may well be that of an ideal which represents in its completeness what the finite seeks and in which it finds, as its purpose.

As an ideal it is more than any of the finites or any aggregate of them, yet it depends upon the expression of itself by the finites in so far as actual reality is itself an element in that completeness. If it is an expression of an absolute reality as an 'already' actual, it is no less an error to conceive of the actual moment of time as possessing any value apart from the degree in which it expresses the absolute reality, and it takes of eternity. Whether this involves a further advance—return, it may be, from the notion of subject to an enriched notion of substance—is a question on which other articles may be expected to throw further light. In any case, ethical philosophy has nothing to lose but everything to gain by adhering itself with the most thoroughgoing criticism of its ideals in the light of a sane monism.

(J. H. MUIRHEAD.
ETHICS (Rudimentary). — The procedure adopted in the present article is as follows. (1) A broad characterization is attempted of the lower culture phase of human life, carrying with it a specific type of ethics. (2) The main determinants of this phase of life are briefly analyzed, with the object of showing how physical causes, on the one hand, and, spiritual motives, on the other, combine to sway the course of human life; the sphere of moral evolution being identified with that of the spiritual activities in question. (3) The particular determinations to which these moralizing forces give rise are rapidly surveyed, and some of the salient features of savage conduct at its most intelligent are exhibited as the result of ethical or quasi-ethical sanctions.

1. The general type of conduct prevailing in rudimentary society. — It has been assumed that the lower culture is sufficiently homogeneous to lend itself to what might almost be described as the method of the composite photograph. Though it is true that higher culture admits of similar treatment, it is convenient here to figure it as likewise a single phase, for the simple purpose of bringing out the essential features of the rudimentary condition in a way of contrast with developed society. It is necessary to conceive of two phases of society (they are in no sense 'ages'), which may be severally distinguished as the synchronic and the syntetic. As the etymology of these terms implies, in the one phase customs form the bond of society; in the other, ends or ideals. The one is a reign of habit, the other a reign of reflection. The one results from a subconscious, the other from a conscious, selection of ethical standards.

At once the most striking and the most significant of the characteristics of the synchronic life of savages is that it is public, in the sense that it admits of little or no privacy. Gregariousness, it has been said, is not association. A contiguous with others is too close and constant hindrances that development of personality and independent character upon which syncenic society depends. In synchronic society the normal individual has no chance of withdrawing into himself. Hence he does not reflect; he imitates. Now, when every one imitates every one else, it might seem that a vicious circle must be formed, and society must come to a standstill so far as any real progress goes. As a matter of fact this is not the case. For the most part, however, the successful readjustment of the unconscious in the subconscious and the unconscious in the other forms the bond of society. (b) It follows that, within a given society there is always a plurality of circles, not necessarily concentric, within which symbiosis takes place in varying degree, the true centre and radiating point of moral influence will always be that particular circle within which the closest and most permanent symbiosis occurs. This circle of most effective symbiosis may be termed the social focus. It will be for one type of community the family, for another the kin-group, for another the village, whilst more exceptionally and for particular classes it will be the men's house, the secret society, the military regiment, or what not. Even if it be not always easy to answer the question, it is at least worth asking in every case. Where, for these savage folk, is the nearest equivalent to our 'home'? For not only does charity begin at home, but society, when social life is at its best, occurs as a kind of symbiosis, long beyond the social body, and it may almost be said to end there. (c) It follows that, corresponding with this social symbiosis, there is likewise what Lévy-Bruhl is justified in calling a mental symbiosis,1 and even a symbiosis of intellectual and ethical life (Les Fonctions mentales dans les sociétés inférieures, 94). Or, as Durheim-Mauus put it (De quelques Formes primitives de

* * *

1. If one or two of the most powerful men settled upon the advisable course of action, and were strong enough to enforce it, the population would be more or less powerless. But in the absence of these conditions, a somewhat larger number of men would naturally possess the power to act, and it would be the business of all concerned to agree upon and carry out.
classification,' *A Soc. vi. [1901-02] 70,* the mental attitude is fundamentally *sociocentric.* The actual way in which the folk themselves are grouped together provides the notion of the way in which all the others are hit by it. Exactly the same scheme of sympathy and antipathies governs things in general as governs the men themselves. Certain animals, certain plants, a vast number of other outstanding varieties of animate and inanimate things, belong to my group and belong together, whereas your group owns another class of things, and the associations thus arising constitute the essential natures of the things themselves. The 'confusion of categories,' with which Hobhouse (*Morals in Evolution,* ii. 9) charges rudimentary thought, is merely a confusion of such categories as we have since obtained by a slowly-developed attention to the intrinsic relations holding between things in themselves. The savage does not confuse his own categories, but these are almost meaningless to us because strictly relative to the idiosyncrasies of his particular little society. If he is a member of the bear-totem, bear-meat is poisoned (unless taken homoeopathically), whether bear-meat in itself injuriously affects the human stomach in itself or not; and so on. Now, whilst this attitude of ours is as far as possible unnecessary (for we conquer Nature only by obeying her), it positively extends, in a way that only the more religious amongst civilized men may faintly appreciate, the sphere of his ethical interests. His whole universe being socialized and anthropomorphized, it becomes for the savage a battle-ground of quasi-personal powers that are in league, or, more strictly, in literal synthesis, either with him and his, or with other human beings who are more or less against him and his. Consequently, lacking our mechanical control over Nature, he has little or nothing but his ethics to depend upon—his ways of dealing with friend and foe. So far is the savage from being immoral, as some have called him, that morality may truly be said to be his all-in-all; though doubtless it is a morality which in general and on the whole he does not think out, but rather lives out, feeling his way by sheer social tact with his human neighbours, and with that enviroring universe which is for him as but human society writ large.

*The determinants of conduct in rudimentary society.—* The synchronic phase of human society having been generally characterized, it becomes necessary in the next place to designate the general factors or determinants that combine to produce it. From an ethical point of view the main object must be to show how, like every other phase of human life, it is hung somewhere between the opposite poles of physical necessity and moral freedom. One set of determinants may be classed as *physical,* in the wide sense which includes the psycho-physical. They will be dealt with under the two broad headings of 'Heredity' and 'Environment.' The other set of determinants may be termed *moral.* They will be considered under the two heads of 'Social tradition' and 'Personal initiative.'

(1) *Heredity.*—That the laws of heredity (p. 88) apply to man admits of no doubt. The working of those laws, on the other hand, is at present only dimly understood. Now, it is only too easy to suppose that what science cannot for the moment grasp, it will all the more deny. But Ethics is apt to ignore heredity, namely, because to admit that some men are born with a greater capacity for morality than others is, from the normative point of view, unedifying, at any rate at first sight. Nevertheless, it is important to allow fully for the congenital dispositions that form the *terminus a quo* of moral evolution. The effects of heredity, as it applies to man, are palpably manifested in those differences of physical type which are due to what is vaguely known as race, or the race-factor. Even here science has failed to establish a satisfactory kind of relationship between any physical feature and a specific shape of head, type of hair, colour, or any other physical feature proving a sufficient mark of descent. The fact remains, however, that certain physical traits of physical type have been handed on, along more or less traceable lines, from the dawn of history, and seem likely to persist so long as sexual selection remains what it is amongst uncivilized and civilized peoples alike. Less palpably, but no less certainly, there is a steady elimination in process within any given human society in favour of those physical types that are relatively immune as regards certain recurrent forms of disease. So, the student of Ethics, however, looks chiefly in the mental rather than in the physical effects attributable to heredity. But a satisfactory criterion of these is even harder to find. The more objectionable thing is the force which best sums up the inherent part of mind) treats it, not as a determinate mechanism, but rather as a disposition to which a certain measure of plasticity essentially belongs. Thus Hobhouse (p. 86) notes that 'the strong moral tendency (by which we conquer Nature only by obeying her)' is the strictly moral sense, which is to say that an individual whose moral will is found to vary greatly in individuals, to be quite fallible, often imperfect and capable from an early stage of employing elementary reasoning in its service.' Again, McDougall, in his *Social Psychology,* seems to admit that instinct, owing to its intrinsic plasticity, passes over into intelligence without observable transition. Nevertheless, he makes the following reservation. Every instinct on its physical side, he maintains, consists of three parts—an afferent, a central, and an efferent or motor. Correspondingly, on its psychical side, cognitive, affective, and conative activities are manifested in the same order. The plasticity belonging to the instinct, however, shows itself mainly at the two ends of the process. To the central part, on the contrary, and hence corresponding with the affective manifestations, he believes a relatively high degree of constancy to attach. His criterion of instinct, therefore, is the presence of some specific emotion. But if this criterion be adopted—and at present no better one seems to be forthcoming—we reach a position where, from our ethical point of view, is almost paradoxical. On the one hand, our emotions become closely associated with the hereditable and predetermined side of our nature. Yet, on the other hand, emotion is a root-factor in moral development as, for instance, two of Schopenhauer's chief principles, the will to live as a principle of action, and the will to live as a principle of passion. This plasticity is more or less traceable to the fact that both *sideral* and *sociocentric* processes of our nature are not and cannot be affected by education. And is morality largely a matter of race? If indeed it be so—and science as science must seek the truth, whether it seems at first sight edifying or not—if instinct (the facts) be, as McDougall suggests, the function of intelligence simply to refine on a pre-existing fund of sound natural tendencies, by providing these with objects on the one hand and modes of realization on the other, whereby they are aptly satisfied, then how to breed sound natures becomes the all-absorbing interest of ethical science. The crux of heredity must be faced and solved, instead of blindly trusting to the education to turn moral sows' ears into silk purses.

It remains to add that the popular view which ascribes a greater innate susceptibility to emotion to savages as compared with civilized men is in all probability false. The tests devised by experimental psychology, so far as they carry us, tend to show that savages are emotionally more sluggish.
and obtuse (cf. the experiments on white and on black women [F. A. Kellor, Experimental Sociology, London, 1901, p. 77]). The source of the fallacy lies in the prominence given to emotional manifestations by the conditions of the social life of savages. It is true that the emotions are exhibited, but, analogously, and symmetrically, to the effect that emotions are intensified whilst ideas are neutralized; the reason being that the emotions are transferred by imitation of the movements of the ancestors and assist their outward expression, whereas ideas are not transferred under conditions prejudicial to reflection. As Lévy-Brühl (p. 426) puts it, we should speak not so much of the collective ideas of a savage group as of collective mental states of an extreme emotional intensity, wherein idea is as yet not differentiated from the movements and acts that embody it. Nevertheless, the civilized man is not deficient in emotion because his higher training enables him to keep cool. He cannot do without the physical basis, say, of courage, any more than the savage can, but, on the contrary, needs it all the more because an intelligent application of his impulsive tendency to the needs of the situation demands a regulation of those more definite movements of the nerves which are the by-products rather than the springs of intense activity.

(2) Environment.—The term 'environment' (q.v.) may not at first cover all those influences, proceeding from the circumstances wherein a man experiences existence takes place, which appear to control the course of that experience rather than, conversely, to be themselves controlled thereby. The line between these opposite controls cannot be drawn exactly. Thus the mother's body constitutes an antenatal environment which the child itself does not in any way control; yet the mother up to a certain point can do so. Or, again, geographical conditions, the distribution of land and water, and so on, might seem at first sight beyond human sway altogether; yet such a work as that of Marsh, The World as modified by Human Action (London, 1874), makes it plain that intelligently, and more often unintelligently, man can affect his physical environment for better, or, still more easily, for worse. Once more, food-supply, as dependent on the local fauna and flora, does not absolutely condition human life, inasmuch as this reacts selectively upon it, so that the whole terrestrial globe is made to respond to the requirements of the civilized breakfast-table. Lastly, what may be termed the distribution of the free environment — meaning, by free environment, the pressure exerted on one area of population by another, with the resultant wars, emigrations, and so forth, and the pressure exerted within the same area of population by the various parts, whence arises such a phenomenon as the rush to the towns—constitutes an objective condition with an influence of its own. Yet, on the other hand, distribution of population, and its ultimate causes, namely, rate of fertility, mobility due to facility of communica- tions, and the like, are within limits subject in their turn to human policy, not to say politics. In short, what is known as force of circumstances must be treated as a determinant of man conduct, even whilst the aspiration to rise above circumstances, that is, to make them rather than allow them to make us, may legitimately figure amongst the highest of our ethical motives.

Thus, there is considerable scope for the new department of science which its founder, Ratzel, names 'Anthropo-geography,' and for the kindred branch of study termed by Durkheim and his school 'Social Morphology.' To say at present a danger, however, lest this type of physical explanation be overdone. Man may be, as Ratzel says, 'a piece of the earth,' but he is not merely that, by any means. Indeed, it may be expected that it is especially at the stage of savagery, when man is far more dependent on his immediate environment, that the application of these methods is likely to prove fruitful. Thus, Mauze in a study of the environting conditions of Eskimo life ('Essai sur les variations saisonnières des sociétés Eskimos,' M.A. See. ix. 1901) has shown, exactly in the sense that there is an extent a 'function of the physical factors of climate, food-supply, and distribution of population taken together. On the other hand, when civilization is similarly treated, as in the case of the 'economic materialism' of Marx, there is likely to be taken account of 'imponderables,' or, in other words, of ideas and ideals. Even in regard to savagery, however, it must not be forgotten that man, as known to anthropology and pre-historic archaeology, is always more or less the 'lord of creation,' the master of his environment; so much so, that even during the great Ice Age in Europe, when the environment on which they depended proved too much for so many animal species, man, thanks to the use of fire and other mechanical devices, managed to hold his ground and to cultiv- ate a high type of fine art into the bargain. In- deed, man's environment, as contrasted with his weakness in coping with the human environment, namely, rate and distribution of population, is perhaps the main source of his need for an effective Ethics.

Even at the present day, under civilization, a leading problem of human life is how to keep pace ethically with the changes in the social economy that are due to material progress.

(3) Social tradition.—At this point it becomes necessary to pass to the consideration of another set of determinants, which are not physical, as are heredity and environment, but moral. Social tradition, of course, may readily be represented as a sort of environment, or atmosphere wherein an indi- vidual is surrounded and conditioned ab extra. But it is safer to attend chiefly to the psychical elements, sentiments, ideas, and so on, with which this en- vironment or atmosphere is, so to speak, charged. Another way of putting the same thing is to say that the influence exerted on a man by social tradition makes itself felt within him in a way quite different from that in which environment or even heredity may themselves feel. Social tradition makes itself felt within a man essentially, that is, most characteristically, as a sanction. A sanction may be defined as a judgment of validity or invalidity to which some degree of pressure is applied, or which is regarded (sanctio in Roman law is that clause in a legislative enactment which invokes a curse on the offender). Arising as it does in a more or less spontaneous and unforced impetus, the influence of social tradition soon ripens into a sense of 'ought,' representing the will of society, or, at any rate, of some power greater and wiser and older and more lasting than oneself. Such is the fact, however one may try to explain it. Social Psychology, which is more concerned content with a limited type of explanation, unlike Metaphysics, which seeks the ultimate explanation, would account for the fact by postulating, as the complement to our initiative tendency, a tendency to stimulate and assist imitation in others, and especially in the young. Thus, whilst the chick imitates the hen, as we say, 'instinctively,' so likewise does the hen no less instinctively encourage the chick to imitate. In this tendency to encourage imitation we may discern various subordinate types of activity, notably three, namely the tendencies to impress, to punish, and to persuade. Correspond- ingly, the care is embodied in social tradition may be reduced, in the interests of a broad and drastic treatment of the subject, to three—religion, law, and education. These are the three main types of sanctions.

(a) Religion.—The function of religion, regarded
as a sanction, is to inculcate the Good by investing it with impressiveness. The religiously impressive is the social, and the Good. The idea of the sacred consists especially in the gradual differentiation of what is both sacred and good from what is or appears to be sacred, but is, nevertheless, at bottom bad. Amongst savages, the notion of tabu (a Polynesian term, embodying, like taboo, a wide-spread savage notion, i.e. mystically powerful. Now, to be dangerous, because powerful, in a mystic (i.e., mysterious or supernatural) way, is a quality that may attach to bad things as well as to good. Hence religion, which is concerned with the mystically good, has at first much in common with magic, which only in the long run is cut off from religion to become a means for all 'trafficiking with the devil,' i.e., for all use of magical formulae to effect bad and anti-social ends. From the psychological point of view, sacredness corresponds with the sense of awe, as excited by the display of supernatural power, in the magic, which McDougall (op. cit. p. 131, cf. 305) plausibly resolves into a trinity of primary emotions, namely, a fear which drives away, a curiosity which attracts, and a submission which disarmeth existence. Ace, therefore, may vary, according as one or other of the ingrediants prevails, from an abject and grovelling terror to an aspiring respect tempered with humility. Correspondingly, in certain aspects the religion of savages, and even of more advanced peoples, may be a religion of almost pure fear. At its most typical, however, it is in all stages of its development so closely associated with the social tradition that embodies the vital aims of each and all that its appeal is sympathetic rather than minatory and purely coercive. Social tradition at the synnomic stage of society, namely under conditions of symbiosis, when mutual imitation of the outward expression of emotion helps to intensify men's feelings, is capable of exciting awe in several ways at once; and, so long as the congregational forms of religion are kept up, the same phenomena will recur. The imposing exhortations, the mystic orisons, amounting in strange prescriptions, the very oddity and uselessness of which invest the sound remainder with the majesty of twilight. Secondly, it is ancient, its origin being lost in the dreadful yet glorious past, and calling upon the myth-making faculty to consecrate it by stories about supernatural Creators, first parents, culture-heroes, totemic ancestors, and so forth. Thirdly, it is always more or less sacred, its repositories and editors being a ruling and relatively educated class, which rarely if ever feels awe towards precisely the same objects as do the less enlightened, the women, the young, and, in a word, the uninitiated, but is nevertheless in normal conditions subject to a similar but more refined awe as it confronts some more ultimate secret. In these ways, then, and in others, religion consecrates the Good as such to a transcendent life imputed by each generation to the next, and by rendering it impressive helps the rising generation to imitate and assimilate it. Hence, the function of law, as a sanction, is to punish transgressions against the Good as embodied in the social tradition. Its remote origin may be what Baghot (Politics and Police, London, 1873) calls 11 persecuting tendency, which visits

with the common displeasure all departures from the strict imitation of the prevailing fashion. The name author, however, often refers to the 'wild spasms of wild justice' to which the lower savagery is liable, implies that some sense of a social Good to be maintained runs through these outbreaks of passion at first sight almost purposeless and automatic. Indeed, when public vengeance is excited by the folk as a whole from the traitor, or, again, from the breaker of tabu or the person who practises black magic, the mere fact that all assist at the infliction, is enough to make the object of the social will, to which meaning and purpose are felt to attach. It may not be so obvious at first sight how private vengeance incorporates and enforces the social tradition. Let it be noted, however, in the first place, that the juristic maxim applies here, 'What the sovereign permits he commands'; which is to say that in a society lacking a centralized authority the social will must perform manifest itself in isolated repressions of crime carried out by self-constituted judges. In the second place, private law in savage society is the affair not of individuals but of kin-groups; and the communal responsibility acknowledged by the member of a clan is a socializing force of the imperative means, by which are mainly concerned with the framing, applying, or enforcing of its punitive enactments. At an earlier stage, however, State, Church, and Society are almost one. For instance, rudimentary law is largely concerned with the violation of tabu, who is typically the criminal at this stage, whilst, conversely, rudimentary religion supplies law with dreadful forms of procedure—ordeals, oaths, and so on—with special punishments, such as costly expiratory offerings; and—most effective sanctionary influence of all—with the notion of supernatural powers at the back of the law, such as a Divine legislator, supreme author of all precedents.

(c) Education.—Under this last head may be summed up all those homelier and gentler forces of persuasion which, without show of coercion, yet none the less effectively, lead the individual member of society to submit to its traditional injunctions. Education is not merely a matter of training children, but proceeds throughout a man's life so long as he is capable of being modified by any fresh experience as far as he is conscious, or even where he is not. Education is most effective where it is not uncommon to find that initiation, which is at least as much an educational as a religious institution, is not completed at the puberty rites, but carried on far into manhood in a series of fuller initiations opening up ever wider horizons of social duty. Education, amongst savages and civilized men alike, is distinguishable only to a certain point from religion and law, being never on the one hand wholly confined to secular subjects, or on the other able wholly to dispense with punitive machinery. It must not be forgotten, however, that under this head must be included influences so kindly and intimate that the individual is hardly aware that they are the patterns and he the clay. Language itself is the greatest of educators; and yet it is the primary source of self-consciousness and self-realization. Unconsciously it generates literature, even savages having their literature of folk-tales, proverbs, songs, and so forth. In early society, however, education comes mainly of more or less tender sense, than of inward thought, and symmoric life is a perpetual pageant of dances and shows; whereas civilization is essentially the attribute of a reading public. If a single differential is sought to mark off civilization
from savagery, no better one is to be found than the invention of writing. Hereby human intelligence acquires a new dimension. The physical symbols largely make possible those mental symbols which we know as abstract ideas; and these rule our world. Ethics itself is often identified with the theory built upon certain highly abstract ideas, too abstract indeed to be generally understood, and so to exert much influence upon society at large. From the historical and comparative point of view, however, Ethics is as wide as the theory of the moral influences which, in the consciousness of mankind, are involved by less than in the

of his abstract thinking, point the way to the Good. Of these influences social tradition has now been summarily considered in its leading aspects. It remains to take note of another influence, too often overlooked, namely the initiative of the free and responsible individual.

(4) Personal initiative.—When full allowance has been made for the influences of a man's heredity, his environment, and his social tradition, is there anything left that could possibly influence him, or, indeed, that would be there to be influenced? Have we accounted for the man completely? Whatever the metaphysician may say for or against the reality of intuition from the standpoint of science, it is unnecessary at this level of science to distinguish the effects of personal initiative as in their way unique. Without entering on the question whether, apart from the individual centres of activity, human society is, or is not, a soulless thing, we need here concern ourselves only with the individual activity that is manifested in so marked a degree as to appear decisively to exert a purgative control over the course of events. History is not merely the history of great men, but, on the other hand, the human drama conceived as the mere product of a complex of impersonal forces would be like the play of Hamlet with its leading character left out. To confine our attention to the moral genius, if Socrates, or Buddha, or Christ be withdrawn from the reckoning, the source of the truly revolutionary movements usually associated with their names is nowhere to be found. At the same time, the type of explanation which relies on social as contrasted with individual forces for its clue can and must delimit the province of personal initiative by showing where the initiative is to be sought or hindered. Thus, the levelling influences of synecistic society prove normally, though not invariably, fatal to individuality, as has already been said. On the other hand, specialization of social functions encourages responsibility, though it does not necessarily produce it. The mere fact that the social system requires individuals to be sorted out and educated each for his special task, gives potential initiative the chance of maturing. For example, it is within the relatively specialized class of medicine-men that the social reformer is especially apt to arise; while, in a lesser degree the specialization of sex functions and consequent limitation of the womans to domestic duties permits to the male as such a greater opportunity of realizing such originality as may be in him. It remains to add that, ethically, the selfishness which lies in a high degree of initiative involves a self-respect which is not inconsistent with self-sacrifice, but, on the contrary, tends to unite the two principles as aspects of one and the same Good. Even the self-regard of savages, whilst it manifests itself as a love of self-decoration, or as boastfulness, or as the habit of retaliating on an affront, leads likewise to the self-devotion of the warrior and leader, and foreshadow the developed individuality which rises above individualism to the disinterested realization of the idea of Good for its own sake.

3. The determinations of conduct in rudimentary society.—That which the determinants of conduct discussed in the previous section combine together under the term 'social instinct' may be termed the determinations. Of such determinations, those that are reckoned by those concerned to make for the Good are usually known as types of virtues, conduct, or virtues. A classification of virtues so far as the study of their historical evolution must be founded on a consideration of those relations in which the moral subject, the individual, who seeks the Good, is involved by less than in the framework of his abstract thinking, point the way to the Good. Of these influences social tradition has now been summarily considered in its leading aspects. It remains to take note of another influence, too often overlooked, namely the initiative of the free and responsible individual.

(4) Personal initiative.—When full allowance has been made for the influences of a man's heredity, his environment, and his social tradition, is there anything left that could possibly influence him, or, indeed, that would be there to be influenced? Have we accounted for the man completely? Whatever the metaphysician may say for or against the reality of intuition from the standpoint of science, it is unnecessary at this level of science to distinguish the effects of personal initiative as in their way unique. Without entering on the question whether, apart from the individual centres of activity, human society is, or is not, a soulless thing, we need here concern ourselves only with the individual activity that is manifested in so marked a degree as to appear decisively to exert a purgative control over the course of events. History is not merely the history of great men, but, on the other hand, the human drama conceived as the mere product of a complex of impersonal forces would be like the play of Hamlet with its leading character left out. To confine our attention to the moral genius, if Socrates, or Buddha, or Christ be withdrawn from the reckoning, the source of the truly revolutionary movements usually associated with their names is nowhere to be found. At the same time, the type of explanation which relies on social as contrasted with individual forces for its clue can and must delimit the province of personal initiative by showing where the initiative is to be sought or hindered. Thus, the levelling influences of synecistic society prove normally, though not invariably, fatal to individuality, as has already been said. On the other hand, specialization of social functions encourages responsibility, though it does not necessarily produce it. The mere fact that the social system requires individuals to be sorted out and educated each for his special task, gives potential initiative the chance of maturing. For example, it is within the relatively specialized class of medicine-men that the social reformer is especially apt to arise; while, in a lesser degree the specialization of sex functions and consequent limitation of the womans to domestic duties permits to the male as such a greater opportunity of realizing such originality as may be in him. It remains to add that, ethically, the selfishness which lies in a high degree of initiative involves a self-respect which is...
done, and enrol themselves amongst the more highly civilized nations. We speak with Plato of 'conversion,' but the term is inexact; and it would be truer to say that human nature, being peculiarly virtuous, needs merely to be relieved of its ignorance of the ways and means by which virtue is acquired. The problem for Eugenics is how to eliminate the unintelligent and unpleasing rather than the bad at heart—to eliminate the traits of the human organism, not by killing individuals (for such butchery but depraves those who kill), but, more radically and yet mercifully, by preventing them from being born at all.

(1) The domestic virtues.—Tylor has said: 'The basis of society is the family' (CE xxi. 711), thus endorsing the time-honoured dictum of Aristotle. One school of anthropologists, who favour what may be termed the 'homo-theory' of the origin of society, might be inclined to retort: 'First find your savage family.' Their hypotheses, however, concerning promiscuity, communal marriage, or what not, frankly refer to some remote past which, if it ever existed, lies at any rate quite beyond the range of scientific observation. At most they find amongst existing savages a few alleged survivals of a social condition when there was no marrying in a wider sense that extends to certain of the lower animals no less than to man, is defined by Westermarck (Hist. of Hum. Marriage, 1894, p. 357) as 'a more or less durable connection between male and female, lasting beyond the mere act of propagation till after the birth of the offspring.' Marriage proper, on the other hand, may be defined with Lewis Webber, as 'kinship, and Religion, London, 1911, p. 2), as 'an exclusive relation of one or more men to one or more women, based on custom, recognized and supported by public opinion, and, where law exists, by law.' Now, it is a curious fact that marriage proper occurs amongst those savages who in most respects have the most rudimentary culture of all, such as the Andaman Islanders, Veddas, and Bushmen. Yet with societies of a slightly higher grade, notably such as have totemism in one or another form, it is often the case that the family is somewhat overshadowed by the kin-group ('clan' under mother-right, 'gens' under father-right). In other words, which remains her knock out, is not often feebly, inasmuch as they belong to different kin-groups, mother and children or father and children are in intimate communion with each other as members of a kin-group which includes persons whose relationship in the actual matter of blood is distant or perhaps non-existent (though usually blood-relationship is imputed by means of the signment of a common ancestry). It remains true, however, that, whether it be represented by the family, or by some quasi-familial institution, the kin-group, the communal household, or what not, there is always for the savage a 'social focus,' a home-circle, where the virtues pertaining to the social intercourse are fostered by mutual relations of special intimacy. These relations may be here briefly considered under three broad heads: (a) relations between the sexes, and, in particular, between husband and wife; (b) relations between young and old, and, in particular, between parents and children; (c) relations between kinsmen in general.

(a) The adult savage woman is normally a wife and mother, and it is as such that she is primarily related to the community regarded as a moral whole. Thus her economic duties follow directly upon these personal functions; her function is that of directly propagating and nurturing the race, whilst the function of the male is protective, that is to say, is indirectly race-preserving. If happiness consist in the exercise of unimpeded function, both sexes should be happy in the normal savage community, where there are no unmet expectations. Neither have a husband nor wife a burden of the men. Physically woman's is perhaps the harder lot. Child-bearing, indeed, is not so great a strain upon the daughter of nature as is the need of continually suckling her child until it is well and sound, but it is a great strain for her when life becomes relatively sedentary. For amongst hunting peoples not only must she carry her infant, but she is also bound to be carried in general, that the men may be at liberty to use their weapons. When it is added that the sexual life begins early, namely as soon as puberty is reached, or occasionally before, it will not seem surprising that the savage female tends to age more rapidly than the male. The male, however, is far more liable to be cut off whilst still in his prime.

Passing on to note the influence of social tradition, we come at once to the institution which more than any other determines the relative status of male and female, and in particular of husband and wife, for better or for worse. This is the custom of exogamy, or marrying outside one's kins, though usually inside the wider circle of the tribe. A few of the lowest peoples, mostly miserable remnant whose endogamy or marrying-in may be a result of degeneration, are without this practice, but it is typical of rudimentary society as a whole. What exogamy means for the man and woman who marry is that one or other must exchange the home-circle for another. Now, the morality of savages being narrow rather than lacking in intensity, the consequence is that to break with intimates and dwell among strangers involves a sojourn in a moral wilderness for whichever of the two parties is the outsider. Thus, when mother-right takes the form of the woman remaining amongst her kin and the man playing the part of a visitor liable to sorvtes, there can be no doubt that the woman's is the happier lot. Indeed, all the forms of mother-right, the technical differentia of which is merely that the mother, not the father, hands on the family name, appear normally to involve greater consideration for the mother, if Steinmetz's (Entwicklung der Strafe) statistical methods are to be trusted. As the wife normally owns the children, the husband has to fear their vengeance if he abuses his rights as consort. It remains only to add in this context that the origin of exogamy is quite obscure. There may be, as Westermarck thinks, a race-preserving instinct against in-breeding behind all. As it meets us in history, however, exogamy is a full-fledged institution at once legal and religious as regards its sanctions. See series of artt. under MARRIAGE.

Another world-wide element in the social tradition of savages that bears strongly, and on the whole very hardly, on the moral status of the woman and the wife, is the magico-religious notion concerning the sacredness of women and especially of woman's blood. Hence the long and weakening confinements at puberty and the protection in connection with child-birth. Hence the avoidance, on the part of the male, of what a woman has touched, lest the contagion of effeminacy be handed on. Hence, too, perhaps, in no small degree the formal and picturesque forms of the marriage ceremony, designed to neutralize the mystic evils likely to ensue from contact with one who is a woman and a stranger to boot. In the other scale weigh several clear advantages. Woman's dependences, under the burden of her sacred sanctity tend to render her an object of what eventually ripens into

ETHICS (Rudimentary) 451
chivalry. Thus, amongst the Australians she is the ambassador between warring tribes, whose very body is able to cement a union of souls between them; or, again, many savages, notably amongst the tribes, take upon sexual intercourse, observed by the hunter, the warrior, the medicine-man, and so forth. Indeed, excessive sexuality, together with its perversions, is not a vice of the lower savages, despite appearances to the contrary (cf. art. CHASTITY), but rather an attribute of advanced societies, especially those that are polygamous, or, again, those in which marriage is deferred for many years past puberty. The so-called orgies of savages, or, again, the wife-lendings, and so on, have normally a ceremonial character, underlyiing which there is the notion of sexual intercourse as a means of mystic communion. On the other hand, what he considers to be regarded is between abominated by the savage, as when it takes the form of incest, that is, any violation of the exogamous rule that is not countenanced by some mystic requirement or ceremonial importance (as, e.g., occasionally in Australia). Incest, regularity excites a 'wild spasm of wild justice,' and spells death for the guilty parties. On the other hand, adultery is, so to speak, a civil affair, an offence against property, being a cause of divorce for the most part under mother-right, though under father-right it often entails severer penalties on the erring wife and her lover (the settlement of the question in any case resting wholly with the individuals concerned than with their respective kins).

Finally, as regards personal initiative, it is in her mystic character rather than as wife and mother that woman occasionally becomes a leader of society, the old woman especially, with her witch-like qualities intensified by her appearance, exerting a sway over the popular imagination that may be good or for evil. Meanwhile, the female sex as a sex is not without its share of influence in public affairs: partly because it is consolidated through having initiatory and other sacred and secret rites and attributes of its own, e.g., in the religions of Australia, and indirectly by the public ceremonies in which they have always been present, partly because they possess and know how to wield what Mill has termed 'the shrewish sanction'; and partly because the desire to shine in the eyes of the women is a male weakness, responsible for much head-hunting and similar manifestations incident to the pursuit of knightly glory.

(b) The relations of men and women have been dwelt on at length, because the woman's half of society will scarcely receive further mention here. As regards the sexes, it is divided between old and young, and those between parents and children, the former must be considered first, because primitive society is normally divided into fairly definite age-grades, and as customs tend to relate to these in their wholesale capacity. Thus, division prescribes food-tabus and other restrictions upon the young as a class, and incidentally teaches them to control their appetites. And, most conspicuous case of all, the young are subjected as a class to initiation, and their moral education is administered by the society as a whole in a form that is made impressive by solemn rites associated with the infliction of corporal punishment. Parental education, on the other hand, tends to be mild. They spare the rod, doubtless chiefly because of natural affection, but in some cases, as notably amongst the Indians of N. America, on the principle that a future warrior should brook a blow from no one. The mother tends to look after her daughter until the latter is herself a mother. Indeed, as she grows elderly, she may become the leading woman of the tribe. As far as the love of women. The son, on the other hand, is often taken away from the mother and sisters some time before puberty, and made to join the company of males, who tend to live more or less segregated from the females in the society and lore. Education, as imparted by either parent in the case of both girls and boys, is a mixture of technical and moral instruction, reminding us of the Persian system as reported by Herodotus (i. 136), 'to ride a horse, to shoot with a bow, and to tell the truth'; though it would seem that the deepest moral lessons are acquired in the course of public ceremonies such as the tribal initiation or the rites of the kin-group or of the secret society. The elders as a whole display the fullest concern in the rearing of the rising generation, and the dramatic character of the ceremonies embodies the intention. The child is made to feel that these can hardly fail to catch the spirit of the effort made on their behalf, whilst they are likewise induced to embody that moral purpose in their lives. A very sheer faith is involved in the efficacy of the ritual wherein it is enshrined.

So far the relations between old and young have been considered from one side only. We probably have to go back to instinct for an explanation of the fact that the solicitude of parents and elders for their youthful charges is perhaps reciprocated only in a relatively feeble and limited degree. Too much, however, must not be made of the sporadic occurrence of filicide, which, like its converse, infanticide, is normally the direct result of very straitened circumstances, when a useless mouth or a drag on the mobility of the group is a handicap in the struggle for existence too heavy to be borne. The typical savage regards his elders, alive or dead, as the embodiments of a wisdom and power with something supernormal about it, and ancestor-worship (q.v.), a special type of cult which emerges from funeral rites which universally show awe and respect rather than mere fear of the dead, and especially of one's own dead, is but the consummation of a natural sentiment which associates the imitation of their elders by the young. This sentiment is naturally filial piety and gratitude. It has been true of man, since the times of the Ice Age, that the grave itself cannot make an end of family affection.

(c) With the subject of the relations between kinsmen in general we almost insensibly pass to that of the relations constituting the body politic as a whole. Kin-ly feeling is kindly feeling in the making. As has already been said, however, the development of kin sentiment is normally restricted, under the conditions of society in which the kin-group is paramount even as against the family, in a way that to the civilized mind seems extraordinary. The division of mankind belongs either to his mother's or to his father's kin, and as such participates in a moral system of rights and duties from which one or other parent is cut off by tabus as by a wall of brass, nay, from which he has as an outsider far more to lose than to gain, as, e.g., in case of a conflict between groups, when parent and child may find themselves actually ranged against each other. On the other hand, so far as it extends, the consciousness of kin is a moral factor of the first importance, involving as it does the principle of corporate responsibility manifested in blood-revenge and the kindred development of private law: in one way it implicate the sense of a mystic brotherhood, as is seen notably in totemic ritual, and in
what is probably its lineal successor, the ritual of the secret society. When, however, the individual does not live among his kin, as, e.g., when he is separated from them by the principle of kinship, but lives instead amongst his father's people, there is a conflict between the principles of kinship and of symbiosis, the tendency of which is to end in some modification of the kinship and to develop something novel, a culture, which customarily grows locally and brotherly love to go together. Kinship of the one-sided sort is normal in those conditions of the social life in which the separate groups are wandering, or at any rate scattered. When the groups can no longer live togethersocially in the agricultural village, the family on the one hand as the home-circle, and the village on the other as the wider circle of group-mates, come each into their own, whether exogamy and kin-organization be retained or dropped. Such generalizations, however, are purely provisional, as the problems connected with the evolution of the social organization of savages are some of the most perplexing that confront the anthropologist.

(2) The political virtues.—Whilst the scope of political virtue, in the sense of the moral bond that unites those who are by reason of local conditions associated together in a symbiotic and individualistic circle, is narrow, because the area of symbiosis is necessarily a restricted one, its emotional quality on the other hand is normally considerable, nay, such as the civilized community, which keeps in such other associations, a vast area by means of ideas, can only envy in vain. What corresponds with the savage to the sentiment and idea of the body politic is something in which he 'lives and moves and has his being,' sensibly and not merely symbolically. The savage individual is lost in the crowd, by being absorbed heart and soul in its life and movement. Heredity, of course, produces the coward and lover as occasional variations; but the conditions of a hard life give the pervert and parasite a short shrift. That the savage will normally answer to a call of duty in its sterner forms, as, for instance, when public danger impends, could be illustrated extensively from amongst the lower savages, though in their case the body politic is less often the tribe as a whole than some one of its constituent groups. Nowhere, however, is this more manifest than at that higher level of savagery at which the 'king' (an elastic term) appears, living personification as he tends to be of State and Church in one. Patriotism at this point becomes almost identical with loyalty and that, which is a constant in the nature of the savage individual stands unbound to be killed, 'for whatever the king says must be done'; and the native of Dahomey explains in a similar strain, 'My head belongs to the king: if he wishes to take it, I am ready to give it up.' The king himself, meanwhile, is inclined to play the autocrat in proportion as he is endowed with personal initiative for better or for worse. In most cases, however, he is himself tied hand and foot by the custom that he is there to enforce—witness Wallace's amusing tale of how the Rajá of Umbok took the census (Malay Archipelago, London, 1869, i. ch. 12).

Again, the kindler side of political duty as manifested in friendliness and good-fellowship is well to the fore amongst unpolite savages, their dances, games, festivals, and perpetual gatherings being possible solely on that condition. And not only are they in general friendly amongst themselves, but they are likewise polite, doubtless in virtue of their predilection for forms and ceremonies. There is, however, a supreme disturber of this friendly togetherness in the inequality of property; on which, more than on any other condition, is based inequality of social degree, a class system. Amongst the lower savages there is a want to reign which is sometimes not unfairly described as a primitive form of communism or socialism. Thus, the rules about the distribution of the spoils of the chase are based on the principle of giving for all. Notwithstanding this being without the special claims of the actual slayer of the animals, whose need is rather honour; and the distribution is even State-regulated in the sense that what customs locally and individually enforce, if necessary, enforce. Such a practice of sharing the produce, as distinguished from the means of production, weapons, and so on, which tend to be owned individually, would seem, however, in most cases to be rigidly confined to the actual symbiotic group of food-mates. Outside this narrow circle there is room for generosity and hospitality, which in their international aspect will again be glanced at presently. It is to be noticed that with this socialist free-handedness there goes, not indeed a want of industry (for the loafer is soon weeded out), but a want of the capacity to save as against a rainy day; so that an alternation of feasts and fasts is the general rule amongst the lower savages. As there is not much scope for generosity, so neither is there for honesty, within the symbiotic circle, both being virtues incidental to a more or less stationary condition, and for which the home-circle is no crime; though in the wider circle of the tribe it may produce complications between groups; whilst contrariwise, as practised against those who are outside that circle, not only are savages and enemies, it is rather a virtue, at any rate amongst peoples of a predatory type. And what is true of honesty holds in the man of veracity: intimates and comrades do not deceive each other; but In disregard to outsiders, to lie is to be diplomatic. With the economic development of primitive society, however, and the growth of classes of unequal wealth, things are somewhat changed. Yet the old communist spirit, assisted by the profusion that accompanies improvidence, and by the love of the display of power, tends to survive in the obligation to keep more or less open house, and to be ready with gifts, which is laid upon chief and leading man. Indeed, the savage 'king's' duty of feeding his people is often so interpreted that, if the crops fail, his want of mystic control over the powers of Nature is set down either to inefficiency or to sheer ill-will—with the result that he is put out of the way.

Finally, the institution of slavery, which is unknown at the level of the lower savagery, introduces a class of semi-criminal renegades who may indeed be war-captives, or a subject-race dominated by invaders, but may likewise be broken men and pawns of the same flesh and blood as their owners. It would seem that, on the whole, the slave receives a larger share of the milk of human kindness at the hands of a savage lord than he would if exploited in the interests of a developed industrialism; but life, when it is not that of the nearest and dearest, is cheap amongst savages, and the constant association of a slave-owning system with bloody rites involving human sacrifice tells its own tale. Moreover, wherever a slave-trade is established, the attendant horrors are bound to have a demoralizing effect. Africa being the standing instance of a continent rotted to the core by such an institution (for the development of which civilization, however, is most to blame). Nevertheless, it must not be forgotten that slavery, though morally an abomination, is possibly one of the main springs of human evolution. 'Here,' says Tylor, 'is one of the great springs of history...race...slavery breeds war...War brings on slavery, slavery promotes agriculture, agriculture of all things favours and establishes settled institutions and peace' (Ch xxi. 70).
(3) The international virtues.—The subject of slavery paves the way for a consideration of a topic which for the student of Rudimentary Ethics must necessarily prove somewhat meagre. Savage moralities being not long been manifested, is primarily an affair of the home-circle. Within this, an entity of a high emotional quality; and without it, eminently fierce and uncompromising—such is the general rule. But actual human sacrifice is ringed round with an intermediate circle. Mates, neighbours, and strangers are, socially and morally, as heart, mind, and soul in some hard-shelled but palatable fruit. We have already glanced at the inter-gentile relations, as they might be termed, which savagery respects, not without a great deal of internecine struggle tempered by a tendency to settle disputes by compromise and mutual arrangement. But inter-gentile relations pass into intertribal (or, as we have, with a view to human evolution as a whole, ventured to name them, inter-national) almost without a perceptible break. Thus, notably in Australia, the kin-groups and local sub-divisions (such as are not to be found in tribes, and these again in wider combinations known to ethnologists as 'nations'). Here it seems quite impossible to draw a line between the customs and formalities generally included under the heading of hospitality, the sending of messengers and ambassadors, the regulated combat, the lending or exchange of trade-articles and of sacred objects, ceremonies, and songs, the mutual understanding as to marriage, inter-sexual prohibitions and privileges, and so forth—and those that extend so much farther afield that a native can, it appears, travel almost from one end of Australia to another without having treated as complete stranger. Possibly, too, the stranger as such tends here, as among other savages, to be sacred, hospitality having thus a religious sanction, since the fear of the stranger's curse, as Westermarck has shown (My i. 578 f.), proves a not ineffective substitute for the stimulus of generosity. In Australia, then, where both race and culture are largely uniform, a certain measure of sympathy establishes itself, despite the difficulties set up by a natural suspicion of unknown men (as exemplified by the 'idle trade') or by the want of a common tongue (necessitating such a device as gesture-language).

It is not till a fuller control over the forces of the native population to grow relatively dense that the struggle for room begins in a given area of characterisation, and the predatory spirit is let loose. War has evolved like everything else, and the art of killing one's neighbour efficiently was not acquired all at once. In protected areas a mild type of savage flourishes to whom war is unknown. Thus the Todas of the Nilghiris have literally no man-killing weapons at all. On the other hand, the fighting qualities would appear to go closely with the breed, and to be the result of a struggle for existence waged primarily within the kind, though a fauna that includes dangerous, man-staying animals (such as are not to be found on the Australian continent) must be an intensifying condition. The accompaniments of primitive warfare are mainly what have given savagery its evil name, certainly not precisely that rudimentary society which is turned, not without good cause, towards the so-called pioneers of civilization; but, as regards themselves, war is often a transitory condition, though there are some definite predatory peoples—Zulus, Masai, Apache, and so forth. The characteristic quality of the savage brain is fierceness, an emotional rather than a calm and reasoned form of valour. As such, it sustains itself, partly by war dances before the event, but partly also by wanton cruelty both during battle and afterwards in the torturing of prisoners, as amongst the American Indians, who thereby not merely satisfied their own feelings, but sought at the same time to 'blood the young whelps,' to wit, the future warriors of the tribe. Again, one form of it is that in which, as amongst the negroes of the Western Sudan, it is practiced with warfare. This revolting practice may consist in sheer 'man-knapping,' as usually amongst the lower savages, or in an 'ende-cannibalism,' or ceremonies which are internal or by the spirit in the family, or for some similar reason, which is not without high moral value; but a warrior tribe will eat its enemies simply, as it were, to glut its rage. There can, moreover, be little doubt that the institution amounts to an asset in the struggle for existence, as the cannibalism inspires terror amongst the neighbouring peoples; so that a cannibal tribe, as, e.g., the Niam-Niam of the Bahr al-Ghazal, may rank amongst the most vigorous, effective and effective people of a given region. On the other hand, such a practice as the head-hunting of the Dayaks of Borneo or the Nagas of Assam is to be regarded rather as a by-product of war, a sort of collection of trophies, and not for good or bad, since they are knit together by a common purpose that demands from them at once all that Bagelot's phrase, 'the preliminary virtues,' covers, namely, courage, loyalty, obedience, and a devotion maintained to the point of death. For the individual, again, war is a school of self-respect; and, though the swagger and boasting of the savage brave has its humorous side, his mastery over that lower self which bids him shun danger and live soft is reflected in a strength of character to which there is added, on the intellectual and ideal side, a sense of honor and of duty. This sentiment has probably counted for more in the history of the race than even the religious sense of taboo, inasmuch as 'Do' is more fruitful than 'Do not,' and defiance of a danger that is known more rational than the avoidance of a danger that is unknown and taken to be a danger for that very reason.

(4) The personal virtues.—Something has just been said in regard to the self-respect of the savage warrior, of whom the North American brave will serve as a by-line. On the whole, he declares that it is precisely in its reference to self, which is almost to say in its reflective aspect, that savage morality is especially weak. The moral subject looks outwards, not inwards, and reads his duty in the movements of the world not in the movements of his own heart. He has his selfish inclinations, which have to be suppressed by social drill and education; but he is incapable of that meekness of the man of culture, the man of world, a reasoned self-knowledge. Yet, conversely, he has but little of that moral individuality which enables a man to stand out for the right even against the opinions of his circle. He sees as one of the crowd, and at most applies his crowd-consciousness to the self as to one who is viewed from without. He can see himself cutting a fine or a humble figure, and is moved accordingly to try that it shall be the one rather than the other of the laws of the life of self tends to stop. One might say that his most internal of moral sanctions is pride of appearance. His tendency to self-adornment, one that unfortunately does not always carry with it the virtue of personal cleanliness, illustrates this type of self-feeling on its lower side. Again, a desire to cultivate an honourable idleness, and to abstain from such work as may lower his dignity, is directly due to pride of self; indeed, the main reason why the civilized man fails to establish satisfactory relations with the savage is that he forgets, or is incapable
of appreciating, the fact that the savage is a 'gentleman' in all the mixed connotation of that term. On its higher side, the pride of the savage gives him an intense sense of his rights, and especially his right to a belief in a Supreme Being that he must not break an insult to either himself or to those who are intimately his. Further, the curious power that man alone of animals has of putting an end to his own life is in the savage, a strong and present desire of exulting suicide (q.v.) to a place amongst the virtues, to die with dignity being, as it were, the projection of the desire to live therewith.

It must not be supposed, however, that self-respect is entirely responsible for the many-sided virtue of a self-regarding type which goes by the general name of self-control. One of the most important spheres of the influence of taboo is the domain of sexual appetite. Thus, in sexual matters, together with the coyness that is but a means of attracting a mate, there goes a shyness, the natural accomplishment of a vitally critical act, which gradually ripens under the sway of taboo into genuine modesty and delicacy of feeling (et. al. CHASTITY). Similarly, eating and drinking, no less than sexual intercourse, are normally surrounded, in virtue of their very importance in the vital economy, by a number of taboos and prohibitions that reinforce the sense of crisis, and turn a mere opportunity of carnal enjoyment into a solemn rite. There is plenty of strong lustiness in the background, however, which the emotional type of savage experience is well calculated to foster; so that, though pent up by religion within strict limits, it discharges itself along lawful channels, in the shape of orgies and carnivals, with the force of a torrent. Clay, religion lends the man-directly minister to the stimulation of passions that seem for the time-being to set all self-control at naught, as, e.g., when the use of drugs and intoxicants is encouraged as a means of obtaining inspiration, or when the gambler is led to stake his all on his own luck conceived more or less clearly as a supernatural power in him and behind him.

In conclusion, it must be pointed out that by means of this same conception of a grace that is in him, yet somehow above him, religion affords the inner life of the savage a great support for reflection on self-development, the 'personal totem,' and individuality itself. It is clear that similar beliefs are as it were the man's own aspiration towards welfare in its more spiritual aspects seen in an enlarging mirror.

(2) The transcendental virtues.—It is a common mistake to suppose that the savage is capable of envisaging a material Good only. His whole religion, it is true, may be summed up in the formula, half spell and half prayer—"Let blessings come and evils depart." But the blessings and evils alike are primarily spiritual. Nature and matter in the modern sense have at most a very restricted sense of the typical savage. His desire is to be in sympathetic relation with a pre-eminently social type with an environment conceived as an array of quasi-personal or personal beings, all mystically powerful and, as such, able to help or to hurt him and his. His universe is thus a moral order, and the savage is a savage just because he is too ready to cope with physical necessities merely by means of moral control or suspension. So much he is already in spirit, if not in effect, the lord of creation that he can imagine no part of creation that is purely unmonal and mechanical in its mode of operation. For him the strong will, a habit sharply defined by man-willed activity, can directly influence the courses of the stars or the currents of the ocean. Thus the God for him is always in some sense God, a power analogous to will-power which realizes itself within man him elf no less than in the other beings of his environment, and can be good as friend, evil as enemy, like man or any other living being. Such a belief clothes itself in a variety of forms, some of which, e.g. the belief in a Supreme Being that he must not break an insult to either himself or to those who are intimately his. Further, the curious power that man alone of animals has of putting an end to his own life is in the savage, a strong and present desire of exulting suicide (q.v.) to a place amongst the virtues, to die with dignity being, as it were, the projection of the desire to live therewith.

It must not be supposed, however, that self-respect is entirely responsible for the many-sided virtue of a self-regarding type which goes by the general name of self-control. ETHICS AND MORALITY.

Australian (Irving King), p. 341.

Babylonian (A. Jeremias), p. 444.

Buddhist (M. Anesaki), p. 447.

Celtic (J. L. Gergi), p. 455.

ETHICS AND MORALITY (American).—The autochthones of North and South America present levels of culture as varied as their habitats. Moral elevations and depressions are as recurrent as changes in race and environment. It is obviously impossible to characterize the Abipones and the Quichua, or the Huron and the Pueblo, in one breath. Nevertheless, for the purposes of a concise survey of the moral attainment of the Indian peoples, we may confine ourselves to three broadly distinguished levels. The lowest of these is presented by the great mass of the S. American tribes dwelling east of the Andes, and by sparser examples in the less-favoured localities of the N. continent. This sub-level is typified by that of the great forest and plains nations of N. America. Finally, following the western mountains, from Alaska to Chile, there occur a series of culture-centres marked by peculiarities in the art—wood-, stone-, and metal-working, weaving, pottery, agriculture—and complexities in social organization which, in the cultivating civilizations of Mexico and Peru, warrant our treating them as a distinct moral level.

1. The lowest levels.—Garcielas de la Vega (Royal Commentaries, Fr. ed., Paris, 1830, or Markham's ed., Lond. 1869-71) has several passages portraying the moral state of some of the wild tribes with whom he came in contact. Thus (vii. iiil.) the peoples of Hunacapampa are described as 'without peace or unity, without lord or government or city; making war never for dominion, since they know not the meaning of more or less, nor yet for plunder, since they have no possessions, and go, for the most part, quite naked; their most precious treasure is the wives and daughters of the conquerors, the men are captured, it is possible, and inhumanly eaten; for their religion, it is as absurd as their manners are fierce.'

In another passage (vii. xviiil.) the Chirihuaas are given a yet worse character: the spies of the Incas report that 'they lead a life worse than the beasts, knowing no divinity, no law, no rulers, without towns or houses; they make war in order to obtain prisoners whose flesh they eat and whose blood they may drink, and, not content with this, they eat their own dead relatives; they never cover their nudity, and have intercourse indifferently with all sorts of women, even their sisters, their daughters, their concubines. The women take the men who please in any manner they please.'

We recognize in these reports an exaggeration natural enough when the facts reported upon are seen through hostile eyes; yet the offences are of such a nature as to place their perpetrators among the lowest of mankind—and to have evidence enough of the reality of the offences.

The Paunari of Brazil have a 'Song of the Turtle'—'I wander, always wander, and when I get where I want to go, I shall not stop, but still go on'—which, says J. B. Steere (U.S. Nat. Mus. Rep. 1901), reflects their own mode of life, passed in roaming from sand-bar to sand-bar of the Brazilian rivers in search of food. This lack of orientation in the physical realm has its intellectual counterpart, shown, e.g., in the utterly rudimentary number-systems of many S. American tribes (cf. Tylor, Prim. Cult., Lond., 1903, ch. viii.; Conant, The Number Concept, 1896, p. 22 f.). It is only to be expected that the moral level will be equally low; and this we find to be the fact in widespread cannibalism and low sexual standards.

Nevertheless, the following words in the very words of Garcielas de la Vega, affirms that 'the wild Abipones live like wild beasts,' we should bear in mind that he is speaking with their ignorance of agriculture foremost in mind. As a matter of fact, he shows them to possess not only very respectable arts, but some very stately virtues (see Account of the Abipones, London, 1822, esp. ii. xii.). To be sure, the equestrian tribes of the pampas have long been considered more superior to the tribes of the tropical forests; yet, even with the latter, ferocity and vice are not the dominant characteristics.

Mode of approach has much to do with the impression derived; it is signed by those who have known the lower peoples the most intimately. And we might regard these idle days as unquestionably the happiest that I have ever experienced.

He found the Indians of this region docile, gay, companionable, trustworthy—mother-naked, but paradoxically innocent of shame. It is incredible that all the difference between such a picture and those drawn by earlier and less unprejudiced pens can represent merely an amelioration due to a casual white influence.

H. H. Prichard is vigorous in his praise of the Tehuelches (Through the Heart of Patagonia, London, 1902, esp. ch. viii.):

's kind-hearted, docile, and lazy race ... invariably courteous,' whose 'women make excellent mothers, and the father is inordinately proud of his offspring, especially of his sons.' The morality of the Tehuelches is, on the whole, admirable. Unfaithfulness in the wife is rare and is not often bitterly revenged. polygamy is allowed, but not much practised.

It will be remembered that continence and chastity are virtues which Dobrizhoffer (ii. viii, xix.) found especially praiseworthy among the Abipones (q.e.), contrasting them with the licentious and degenerate neighbouring tribes; while their unselfish fondness for their children was also noted.

Prichard likens the Tehuelches to the Eskimos, at the other extremity of the Americas: Both races are certainly sluggish and peaceable. And of both little evil can be said.' The testimony of a recent sojourner among the latter is in point:

'In many things we are the superiors of the Eskimos; in a few we are his inferiors. It has developed individual capacity farther than we; he is less selfish, more helpful to his fellow,
kinder to his wife, gentler to his child, more reticent about the faults of others, more patient with the world in general, and best of all, his race. As a guest who could not pay for my keep, as a stranger whose purpose among them no one knew, I learned these things in a thousand little ways. Surely its darkness, was connected with the pleasantness of my life' (Vilhjalmur Stefansson, Harper's Monthly, vol. 117, p. 723).

Of course not all peoples on the lower levels betray such characters. McGee ('17 RBEW, pt. I, 1898) is only the latest among a long series of observers who have found the Seri Indians of Tiburon and the adjacent mainland 'the most primitive and the most bloodthirsty and treacherous of the Indians of North America.' (p. 119). 'Their highest virtue is the shedding of alien blood.... their blackest crime the traitor's blood into alien channels.' (p. 154). In these traits McGee finds the sources of a character which places the Seri, in spite of physical excellence, very near the bottom of the moral scale. Even animal gratitude is absent:

"The 1894 party was fortunate in successfully treating a sick woman of a neighboring tribe; so much so that in the days in the rancheria, distributing gifts to old and young in a manner unprecedented in their experience... yet, with a single possible exception, they succeeded in bringing no more human expression to any Seri face or eye than curiosity, avidity, or food or drink for themselves, which was a running trust. Among themselves they were fairly cheerful, and the families were untroubledly affectionate; yet the cheerfulness was at least chilled and often handicapped by the approach of an alien..." (p. 132).

2. Typical levels.—The presence of an obvious moral sense, as expressed either in custom or in conscious reflection upon moral problems, is the fair criterion of the beginnings of moral elevation. Such a sense is the indubitable possession of the great body of N. American Indians, with many of whom we develop conduct of the highest order. We are justified, too, in regarding the morality of the forest and plains tribes of the northern continent as the typical Indian morality; for we find it already inchoate in many of the inferior offices, while it is the foundation for our understanding of the conceptions of the more civilized groups.

(1) Social organization.—With most observers the first impression of Indian societies is of their lack of organization. 'They love justice and hate violence and robbery, a thing really remarkable in men who have neither laws nor magistrates; for among them each man is his own master and his own judge. Such a state of things is in 1812 of the Canadians (Jenius Relations, ed. Thwaites, Cleve., 1896–1901, ii. 73). That the Indians have no law is a characteristic judgment; and, underestimating as traditional or constitutional the sense of community, it is, of course, the general truth; yet it is safe to affirm that no Indian group is so primitive as not to possess its body of customs, to be violated only on peril of outlawry.

As a rule the ostensible authority is vested in the tribal elders, certain of whom have the prestige which we denominate chiefship. This office may best be defined by characterization:

'The system of authority which prevails in Indian societies is very simple. Each family... is ruled over by the father, whose authority is great. As long as he lives he is strong and active, his wife, his daughters and their husbands, and his sons, until they marry and thus pass from their own family under the rule of a new house-father, are almost completely under his sway. But the father of each, while retaining his authority over his own family, is to some extent under the authority that is, under the force and influence —of the peasan; and, where several families live in one place, he is also under the authority of the headman of the settlement. The authority of the peasan... depends on the power which the latter has to make or exercise over spirits, gods, and judicial decisions are supposed to be the work of spirits, over diseases, and... consequently over the bodies of his fellows. The headman, on the other hand, is generally the most successful hunter, who, without having any formal authority, yet because of his success has hereabout any amount of deference from the other men of his village. He settles all disputes within the settlement, and in the not distant days in all, when there is no one in the habit of war, he used... to determine on the commencement of hostilities (K. F. In Thurn, Indians of America, London, 1853, p. 111).'

Tribal headman, war-leader, 'medicine-man,' and the group of fathers or elders which forms the tribal councils are the rulers of the Indian tribe in either continent. They are not always differentiated, however. In the description just cited the office of headman and war-leader is one; and it is, of course, the rule that a capable war-chief should assume an important role in civil affairs. Yet in the more advanced tribal organizations—as among the Iroquois, Sioux, Creeks, etc. —there is not only differentiation of military and civil chiefdoms but well-marked distinction between the latter, chiefs and sub-chiefs, having at once legislative, executive, and judicial powers.

The civil chiefdoms are usually hereditary, in the maternal line, though the selection is seldom apart from the family, which is finally the apparent or the sole criterion. Unquestionably, the ideal of merit, from the lowest to the highest, is the ideal of social service. Stefansson ('loc. cit., p. 725 f.) gives an illuminating account of a conversation with an Eskimo chief touching the foundations of his office:

"One day, as Ovakayak and I sat in our snow blocks with backs to the wind, and why he was not satisfied with the huge pile already stored away—more than our family of twenty-two could carry in two years. He said, 'I was a chief. And why, did I suppose, was he a chief? Or, now that he was so, did I suppose he would continue being a chief if he were lazy? We had plenty fine weather, at Tuktuyaktok, but who could tell if the people who had gone inland after reindeer would bring them ledges, or possibly with no sleds—carrying their children on their backs because the days were dead and starved. And how about the people west of the Mackenzie at Shingle Point, true, they had caught plenty fish in summer, but they catch none in winter, and they are not sensible now as they formerly were, but will haul a big load of fish a long distance to sell to the traders at Herschel Island for a little tea, which tastes good but does not keep a man alive. And what of the people up the Mackenzie? They depend largely on rabbits. Some years there are plenty of these in the other years, far from them, there are few or none. Might we not some day see many sleds coming from the southwest along the coast? And may not these sleds turn out to be empty because there are no rabbits in the willows? Did I suppose that if all these people came we would have too much fish? And why was he a chief, if not for that? That people twenty days' journey away could always say when they became hungry, "We will go to Ovakayak, he will have plenty food?"

An instance of a reverse order, yet illustrating the same general demand that the chief should be a giver, is narrated by von den Steinen (p. 283):"The power of the chief was not great. In all the larger villages there were several chiefs, who lived in different houses; our village was always impressed by only one of them. 'Protection' was the most important duty in time of peace. The chief was manager of the seclusion of the women, if they must be in the belfry to be baked and the drinks to be prepared on all festive occasions and during visits of strangers. He was simply an householder on a large scale; but he dared not ask if he was wished to have the esteem of his fellow-villagers, much less his tribal neighbours. In this respect the chief of the first Inuit village was kareta, 'had a good heart.' He allowed only a few belfries to be baked for the guests. Generosity was looked upon as the most offensive quality. But this method of rating must have been difficult. Antonio told me about a certain João Cadete in the village of Paratuanas, whose turn it was to become chief, but who preferred to emigrate with moeda de tratar, for fear that he would have to entertain people; so Felipe was appointed in his stead.

But chiefdom among the Indians is not always founded upon benevolence. The career of Tchakta, chief of the A-simboins, as narrated by Father de Smet (Life, Letters, and Travels, 1865, vii. x.), is that of a medicine-man who by means of poison and pure criminality made himself feared and powerful among his people. And, in many other instances, supernatural—powers—frequently exercised for good or evil—have elevated the Indian to a little position of civil or military prisci (cf. Mooney, 'The Ghost Dance Religion,' I. RBEW, pt. ii. [1896]). In the cases of the Aztec Emperor and the Peruvian Inca it is obvious that here were individuals who held any position among their people, and that the functions are united in the one officer, who thus, as it were, figures the whole sovereignty of the nation. The power of the chief thus rests primarily upon some type of personal prestige. Père Biard
ETHICS AND MORALITY (American)

says of the Algonquin 'Sagamores': 'The Indians follow them through the law of the custom, or of kindred and alliance; sometimes even through a certain authority of power, no doubt' (Jes. Rel., ed. Thwaites, ii. 73). In better organized tribes the chief's authority is more definite and even cases, property, and the religious sanction of his installation (cf. ib. xxvi. 155 f.).

In every case, the real source of power lay with the community, consisting of men of quality and character. The council determined all movements of importance, as matters of war and peace, of the hunt, etc. Ability to speak persuasively was hence of much moment, and the orator a man of importance. Police duty fell to the younger and more vigorous warriors,—men of tried and sterling character,—not only in hunting and war parties, but also in the camp, and tribal festivals (cf. Eastman, Indian Boyhood, New York, 1902, pp. 40, 186). Quarrelsomeness and violence within the tribe seem to be rare; except when under the influence of liquor, the Indians of both continents appear to be peaceable in their domestic relations. This fact early impressed the Jesuit missionaries in Canada:

'Leaving out some evil-minded persons, such as one meets almost anywhere, they have a gentleness and affability almost incredible for Savages. They are not easily angered, and, if they have received a wrong from any one, they often conceal the injury—unless there were very few who make a public display of anger and vengeance. They maintain themselves in this perfect harmony by frequent visits, by which they give one another in sickness, by fœdeb, and by alliances.' (Thwaites, x. 515.)

'They are very much attached to each other, and agree admirably. You do not see any disputes, quarrels, enmities, or representations among them. Men leave the arrangement of the household to the women, without interacting with them; they eat, and decide, and give away as they please, without making the husband angry. I have seen my host a, girl of a young woman that he bad with him what became of the provisions, although they were disappearing very fast. I have never heard the women complain because they were not invited to the feast, because the men ate the good pieces, or because they had to work continuously—going in search of the wood for the fire, making the house, dressing the skins, and busying themselves in other very laborious work. Each one does her own little tasks, gently and peacefully, without any disputes.' (cf. 233 f.)

Crimes of violence, where they do occur, are punished by the injured person or family. In the more primitive societies murder is the occasion for blood-revenge (cf., e.g., Thwaites, iii. 93 f.). In more complex societies, crime may be atoned for or compounded with the relatives of the slain (see EXPATRIATION AND ATONEMENT [American]). Outlawry,—especially for an offence against a clansman,—is a formal form of punishment, and is sometimes the prevailing punishment, as among the Seri (17 B.B.W., pt. i. p. 273).

In the last resort it is the sanction of the community as a whole,—at least among the typical tribes—which determines the punishment of the offender, as it upholds the power of the chief. Thus, in his chapter on 'The Polity of the Hurons and their Government' (Thwaites, x. 211 f.), Peré Béthune states:

'They punish murderers, thieves, traitors, and sorcerers; and, in regard to murderers, although they do not preserve the several degrees of descendants toward them, nevertheless the little disorder there is among them gives me some idea that their procedure is scarcely less efficacious than is the punishment described elsewhere; for the persons of the deceased, pursued not only him who has committed the murder, but also additions to the whole village, which must give satisfaction for it, and furnish, as it were, the price of the poor, for the purpose, as many as sixty presents. . . . For it is not here as it is in France, where the punishment with the public, even the whole city do not generally espouse the quarrel of an individual. Here you cannot insult any one of them without the whole community resenting it, and taking up the quarrel against him, and expelling him against an entire village. Hence arises war; and it is more than sufficient reason that they prosecute against one village if it refuse to make satisfaction by the presents ordered.'

(2) The family and sexual morality.—Broadly divided, Indian families are of two general types:

that in which descent is counted in the male line, with a relative freedom of the women's personal status, and that in which descent is counted through the mother, and marriage is only between members of clearly marked exogamous clans or gentes. In the former case the family authority rests directly upon the chief, or other; in the latter it devolves upon the brothers of mothers, or even, in a sort of veritable matriarchy, upon the mothers themselves (cf. 17 B.B.W., pt. ii. pp. 259-274), and the family structure is merged in a group of quality, or caste, property, and the religious sanction of his installation (cf. ib. xxvi. 155 f.).

The Indian conception of chastity represents great variations, and is determined by many considerations. Most of the restrictions which appear to grow directly out of the demand for purity of descent, and hence, as with other races, apply chiefly to the women. Yet there are numerous demands for continence on the part of the men, even within the marriage relation—as in the purifications preceding war excursions or during religious festivals. In S. America the custom is wide-spread for husband and wife to abstain from intercourse during the entire period, two or three years, in which a child is suckled. Dobrizhoffer recounts the consequences of this practice among the Abipones (ii. x.):

'The mothers suckle their children for three years, during which time they have no conjugal relations with their husbands, who, tired of their long delay, often marry another wife. The women, therefore, kill their own children with fear of repudiation, sometimes getting rid of them by violent acts, without waiting for their birth. Afraid of being widows in the lifetime of their husbands, they blush not to become more savage than troopers.'

This is no doubt a not unusual consequence in S. America, where divorce is frequently a matter of the husband's whim.

Certainly the fact that white women captured by the Indians of N. America have, as a rule, been respected in the matter of their honour is fair evidence that the Indians are not as a race licentious. And, north and south, conjugal fidelity appears to be the prevailing condition—tempered, perhaps one should add, by facile divorce. 'Little is necessary to separate them,' says Le Jeune (Thwaites, 111), 'unless the parents publish for them not to leave each other so easily.' It is worth noting that he adds: 'A man who loved his (deceased) wife—or a wife who loved her husband—and who respects her relatives, will sometimes remain three or four years without remarriage, to show his love.' Testimony to the mutual affection of Indian couples is frequent, though, of course, the reverse is to be found. Polygamy is found among many tribes, but, although of any conceivable scale, plural wives falling to men of wealth or position, or, in some cases, resulting from the decimation of the male population in war, the survivors customarily taking to wife their wives' sisters.
Virginity in the bride is very differently esteemed in particular tribes. The Huron maidens were in bad repute with the Fathers, and among the northern tribes—Eskimo and Athapascans—the virginal bride appears the bride of but few marriage in moment, as to her industrial value—skill in clothesmaking, house-tending, and the like (see Morice, *The Great Déné Race,* Anthrop., v. [1910] 979 ff.; Parkman's *Hiawatha,* xliii. [1857] xxv. xxxv.). On the other hand, the standard of maidenly morality is often upheld by important tribal sanctions. Eastman (Indian Boyhood, pp. 183-187, *The Soul of the Indian,* pp. 85-99) describes the Siouan *'Feast of the Virgin,'* at which each girl in turn touched a rock-altar, prepared for the occasion, in token of her purity.

Any man among the spectators might approach and challenge any young woman whom he knew to be unworthy; but if the accused failed to prove his charge, the warriors were accustomed to punish him severely. Furthermore, 'our maidens were ambitious to attend a number of these feasts before marriage, and it sometimes happened that a girl was compelled to give one an account of gossip about her conduct.' See art. CHASTITY (Intro.).

Prostitution among Indian women, where it exists, appears to be largely due to contact with degraded whites, although perhaps in some cases the frequency of temporary and adulterous relations constitutes an aboriginal equivalent of the institution. See also, Westerner, MI, ch. xiii.

The real clue to the Indian conception of sexual morality and family purity is to be found in their devotion to their children, as well as of the tribe's personal property. Phile Lalemen rebuked a Montagnais for looseness, telling him he might not be sure of his own children, the Indian replied: 'You French people love only your own children; but we all love all the children of our tribe' (Thwaites, vi. 255). And in the Indian accounts of the battle of Wounded Knee, there is nothing more affecting, as there is no more stinging accusation of the whites, than the evidence of their dear regard for the Indians' children.

... There was a woman with an infant in her arms who was as near the last as she could get to touch the flag of truce, and the women and children, of course, were strung all along the circular village until they were dispatched. Right near the flag a woman was nursing her child, and the Indians knew that her mother was dead but was nursing, and that she would nurse for days, and that she would never drink. At last the Indians thought that they must get that child out, and they took it, and brought it to the chief, and he took it, and he gave it to the Indians, and he said, 'You may have that child.' They took it, and they gave it to the Indians. They did not care to take it, but they did not want to take it, and they brought it back to the Indians, and the chief gave it to the Indians. They said, 'We will take this child.' They had a child of their own, and they gave it to the Indians, and they brought it back to the Indians. They said, 'We will take this child.'

Indians are very sensitive about their children, and the abstract idea of stealing a child is abhorrent to the Indian. No such idea can be imagined as stealing the child of a poor Indian; at least, it is an idea of a great wrong that has any connection with him. Yet the idea of stealing the child of a rich Indian is always connected with the idea of a very great wrong. I am told that an Indian has been known to murder his own child rather than see it taken away from him by a white man. This is a well-known fact among the Indian tribes, and they will not tolerate it.

The custom of stolen children is very common among the Indians, and it is often called the 'pottlatch.' It is a custom that has been carried on for many years, and it is still practiced by many tribes. The custom is that when a child is stolen, the parents are given a certain amount of property in return. This property is called 'pottlatch' and it is given to the parents as a means of compensation for the loss of their child.

There are records of Indians who have stolen children from other tribes, and who have given them a large amount of property in return. One such case is recorded by Parkman, in his *Hiawatha,* where a man steals a child from an enemy tribe and gives him a large amount of property in return. The Indians also have a custom of giving presents to their friends, and this is often done in connection with the custom of stolen children. The presents are called 'pottlatch' and they are given to the parents as a means of compensation for the loss of their child.

ETHICS AND MORALITY (American)

war and hunting, fall to the men, who usually manufacture the implements of chase and weapons of war, and often, also, their own clothing; and upon the men also falls that other occupation which leads abroad, i.e., primitive times, as among the Mexicans (cf. Sahagun, bk. ix.), and one which was thoroughly developed long before the advent of white traders (see Anthropos, v. 943 f.).

Those moral, domestic and routine work devolves upon the women, foreign and adventurous duties upon the men. The judgement of Im Thurn (p. 215) with respect to the Indians of Guiana, that the work of the men 'is at least equal to, though accomplished more fitfully than, that of the women,' is, on the whole, true of the typical Indian society. What gives the impression of laziness in the Indian man is doubtless the fitfulness of his employment; 'the life of the Indian man is made up of alternate fits of energy and of comparative inactivity,' says Im Thurn (p. 269); and this follows from the nature of his work. Possibly also it is in part due to the local and nervous structure of the following upon primitive modes of life, as McGee would explain in the case of the Seri, 'characterized by extreme alternations from the most intense functioning to complete quiescence—the periods of intensity being regular and the periods of quiescence notably long' (7 RBEW, pt. i. p. 156).

War with the Indian is only a more difficult form of the chase. For both employments the same qualities are demanded—courage, endurance, craft—and these may be regarded as essentially the masculine virtues in the eyes of the aborigine. Craft and endurance, involving the most painful and unremitting pursuit of an enemy; fortitude, hardihood to the point of stolical endurance of the most fiendish torments—for the cultivation of these traits the brave undergo rigorous fasts, and submit themselves to strenuous and terrible torments, as in the famous Sun Dance of the Plains tribes (see 'Sun Dance,' Handbook of American Indians, ii. 649-652; cf. de Smet, 247 f., 255 f., etc.).

The Indian conception of war has resulted in the most varying notions of his courage. Thus even the savager—Père Biard (Relations, 1616)—can pass such diverse judgments on the one people as:

'Their wars are nearly always ... by deceit and treachery, ... They never place themselves in line of battle. ... And, in truth, they are by nature fearful and cowardly' (Thwaites, ed., p. 91); and:

'They always make themselves up to the point of death with desperation, if they are in hopes of killing, or doing any one an injury' (p. 69).

As a matter of fact, Indian warfare demanded a very high order of courage, sanctioning, as it did, the most terrible treatment of captives. It was waged, in fact, largely for the sake of making prisoners—thus preserving the character of a hunt—with a view to submitting them to torture.

'When they seize some of their enemies, they treat them with all the cruelty they can devise. Fire or six days will sometimes pass in assuaging their wrath, and in burning them at a slow fire; and they are not satisfied with seeing their skins entirely consumed—their hair, the nails, the thumbs, the nose, the fleshy parts, and thrust therein glowing brands, or red-hot hatchets. Sometimes in the midst of these tortures they compel them to sing; and those who have the courage do it, and hurl forth a thousand imprecations against those who torment them; on the day of their death they must even etch this, if they have strength; and sometimes the kettles in which they are to be boiled are hung over the fire, while the poor wretches are still singing as loudly as they can' (Thwaites, x. 237).

This is but one of a multitude of such descriptions to be found in the Jesuit Relations and elsewhere. This barbarous cruelty which marks the Americans Indians among the savages of the world, and is probably equalled only by the Inquisition and judicial tortures devised by white men. For Indian cruelty is of an intellectual, one might say rational, nature; it is not a calumny; it is not the incoherence of suffering, or a brutal indifferent-

ence to it, as is so often the case with savages; rather it is devilishly devised and inflicted for understanding enjoyment.

The primary motive seems to be to test the fortitude—and hence the immortal virtues—of the sufferer, with whom it becomes a point of honour to make no sign of weakness, but rather to breathe defiance to the last breath: 'Those who dread your tortures are heartless; they are lower than women' (de Smet, 249). If the prisoner dies bravely, his flesh, and especially the heart, is eaten, as a kind of sacrament, with the belief that the courage of the deceased will pass into the spirits of the partakers—a rite which becomes apotheosized with the Mexicans into a huge and terrible theanthropic worship (cf. art. Incarnation [American]).

Throughout the Americas we find this custom: 'Such a practice could not fail to lead to degrada-

tion, in many cases to cannibalism with no such moral purport. Reaction against it is not un-

common among the Indians themselves. Yet it was so violent and the practice was so prevalent, as it is also the chief ground for the bitter excoriation of Indian character by observers who so frequently have only admiration for the Red Man's domestic virtues.

3. High cultures.—The semi-civilizations of Mexico and Peru manifest that natural complica-

tion of moral problems and accentuation of moral consciousness which comes with advancing culture. At the same time the qualities, as well as the faults, by which each is stamped is due to the dominance or emphasis of purely Indian traits.

In Mexico, and particularly among the Aztecs, warlike ferocity is elevated into a veritable re-

ligious consciousness, holding whole societies in pitiless grasp and colouring every conception of life. Indeed, Mexican religion so strongly countered the normal instincts of humanity that, in some cases, at least, its devoted, or at least its more intensive, application to its practices only with 'tears and dolour of soul' (Sahagun, ii. xx.); and it resulted in an attitude toward the world consistently and patiently pessi-

mistic. When a child was born into the world, it was addressed thus:

'Thou art come into this world where thy parents endure troubles and fatigues, where there are burning heats, where there is scorching cold, where there is death, disease and danger; and it is all so great and rare, that there is no content, since it is a place of labours, of torments, and of need.' And if a boy: 'Thy true fatherland is elsewhere; thy art promised to other places. Thou belonest to the shelterless fields where fall the combat; it is for them that thou hast been sent; thy profession and thy science is war; thy duty is to give unto the Sun the blood of thy enemies, that it may drink, and unto the Earth the bodies of thy foes, that it may devour them' (65. xix. xx. xxi.).

Certainly the Mexicans had glimpses of a better order, as is shown in some of the myths of Quetz-

zalcoatl, who became perhaps first by their deep conviction of sin and their readiness to do penance:

'There can be no doubt that the prayers, penances, and con-

fessions described at length in the Sahagun indios (see above), are founded upon the American belief that even these strange deities 'made for righteousness,' loved good, and that, in the world and in the next, punished evil' (Lang, Myth, Ed., and Rel. 5, 1896, ii. 194).

Yet the inevitable impression of their civilization is of a fundamental conflict between brutalizing superstition and an inherent yearning for moral growth, with the latter on the losing side.

Quite the reverse impression is made by the great S. American culture. The two characters that stand out in the Incaism, or Peruvianism, is in the administration of material affairs, achieved on an immense scale,
ETHICS AND MORALITY (Australian)

along with a proselytizer's instinct for reform. The latter may often have been a somewhat hypocritical excuse for conquest, yet the conquist was not free from moralization. Still, the whole moral ideal of the Inca civilization may perhaps best be expressed in the words which Garcilasso gives as the address of the Sun to the Peruvian tribes: "

'These lands...our enemies to have to maintain them therein by the laws of reason, of piety, of clemency, and of equity; doing for them all which a good father is pleased to do for the children whom he has brought into the world and tenderly loves. Although you may say, for as you know, I never cease from doing good to mortals, lighting them with my light and giving them the means of following their affairs; warning them when they are cold, or hot, or hungry, or thirsting: These and their pastures, fruitstilling the trees, making the hedges to multiply, and bringing rain or fair weather as their needs are. It is I who make the tour of the world once each day, in order to see of what the earth has need, to set it in order, to the easing of its inhabitants. I wish that you follow my example, as my well-beloved children sent into the world for the good and the instruction of those wretched men who yet live as the beasts. It is for this that I give you the title of kings, and I wish that your dominion extend to all peoples, that you may instruct them by good reason and good deed, and above all by this example and by your beneficent rule" (Royal Commentaries, i, xv).

The degree in which this ideal was realized is indicated by the most recent writer on the Peruvian civilization, E. H. G. Seligman, in Remains R. Markham (The Inca of Peru, 1910, p. 183 f.), and it exemplifies the greatest and most complex moral achievement of the American Indian race:

'The people were nourished and well cared for, and they managed to succeed. In the wildest and most inaccessible valleys, in the lofty pampa surrounded by snowy heights, in the dense forests, and in the sand-girt valleys of the coast, the eye of the central power was ever upon them, and the never-failing brace, beneficent though inexorable, provided for all their wants, gathered from their tribute, and selected for their children for the various occupations required by the State, according to their sex, origin, and capacity. The State is indeed social as dreams, in past ages have conceived, and unpractical theorists now talk about. It existed once because the essential conditions were arranged in a way which is not or unlikely for another. These are an ineradicable despotic, absolute exemption from outside interference of any kind, a very particular and remarkable people in an early stage of civilization, and an extraordinary combination of skilful statesmanship."

ETHICS AND MORALITY (Australian)—According to the earlier explorers and missionaries and the careless travellers of even recent years, the morality of the Australian aborigines was of a very low grade. Almost all such observers agreed in placing them in the very lowest stages of culture. They were described as bestial in habits, naked, lacking all sense of virtue; the men cruel to their women and children. The women, often driven to infanticide and cannibalism, erud in their dispositions, shiftless, lazy, stupid, deceitful—in fact, possessed of all conceivable evil qualities, deaf to the voice of reason, and ready at theft, and with almost no regard for the value of human life. They were naturally, moreover, given up almost constantly to destructive inter-tribal wars. In the earlier days, according to the recent studies of the natural races have thrown much different light upon the matter. It is now recognized that morality is not to be judged by relationship to some fixed and absolute standard, but rather that it is fundamentally related to the system of social control which prevails within the group. It must, moreover, be borne in mind that the 'higher moral reform' of the whites, in the South, seldom sees it at its best. Without doubt the ignorance and brutality of many of the first white settlers and explorers of Australia were constantly provocatives of retaliatory aggression on the part of the natives. The laziness of the latter may be attributed merely to their inability to fall in with the enterprises of the settlers, or to appreciate the objects of their endeavour or their interests. In the activities of the natives the whites showed the most surprising industry, e.g. in the collection of food, as stated in the preparation for, and performance of, their elaborate ceremonies. The observations which follow should not, however, be taken as applying to the Australian race as a whole, but only to the sections directly observed; for there is no question that there is much diversity in the customs and characters of different tribes and groups.

As to personal virtues, the natives of Queensland were said to be generally honest in their dealings with one another. Apart from murder of a member of the same tribe, they knew no sin but that of theft. If a native made a 'kind' of any kind, such as a honey tree, and marked it, it was thereafter safe for him, as for his own tribesmen were concerned, no matter how long he left it. The Australian native in general was and is possessed in a marked degree of fortitude in the endurance of suffering. There is abundant opportunity for the development of this quality in mind in the painful trials of initiation—a ceremony always accompanied by fasting and the infliction of bodily mutilations of various kinds, differing with the tribe and the locality. These mutilations include the knocking out of teeth, circumcision, sub-incision, and various scarring of the trunk, face, and limbs. Among some of the tribes there are permanent food-restrictions imposed upon different classes. There are also food-restrictions imposed upon the youth and younger men, and all of these are faithfully complied with, although they involve considerable personal hardship (see Howitt, p. 561; Fraser, p. 90). The food-restrictions form such an important phase of aboriginal morality that they warrant further discussion. The following regulations of the Kurnai tribe are typical. A man of this tribe must give a certain portion of his game to his wife, and that the latter contribute, to his wife's father, as the able-bodied man is under definite obligation to supply certain others with food. There are also rules according to which game is divided among those hunting together. In the Mining tribe all those in a hunt share equally, both men and women. In all tribes certain varieties of food are forbidden to women, children, and uninitiated youths; there are also restrictions based upon the totem to which one belongs. The rules regarding the cutting up and cooking of food are as rigid as these regulating that food of which the individual may lawfully partake. Howitt says of these food-rules and other rules that they give us an entirely different impression of the aboriginal character from that usually held. Adherence to the rules of custom was a matter on which they were most conscientious. If forbidden food were eaten, even by chance, the offender has been known to pine away and shortly die. Contact with the whites has broken down much of this primitive tribal morality.

'1The oft-repeated description of the blackfellow eating the white man's beef or mutton and throwing a home to his wife
practice of stealing wives and eloping, among the North Central Queensland natives. According to Spencer-Gillen, wives may have been so secured, but such was assuredly not the customary method in Central Australia at least. They know of no instances of girls being beaten and dragged away by suitors. It is probable that cases of exceptional cruelty more casually came to the notice of the back travellers, and they inferred that these were characteristic. The last named authors affirm that the method of securing wives among these tribes was definitely and universally by tribal usage, and not crude practices whatsoever. Howitt, the authority on the South-Eastern tribes, says that cruelty was often practised upon elopers; but this is manifestly because they had themselves been guilty of a breach of tribal morality. Looseness of sexual relations among these tribes originally met always with severe punishment.

As to treatment of wives among the Central tribes (Spencer-Gillen, p. 50), there were undoubtedly cases of cruelty, but they were the exception rather than the rule. The savage husband had a hasty temper, and in a passion might act harshly, while at other times he might be quite considerate. Indeed, in the case of the Darling River, New South Wales, quarrels between husband and wife were said to be quite rare (Bonney, JAI xii. 129); Brough Smyth says that love is always rare in Australian families; while another observer (Palmer, JAI xii. 281) asserts that the life of the women is hard, and that they are much abused by their husbands. Dawson, who wrote expressly to show that the Australian blacks were not misrepresented, maintained that in Victoria, at least, there was no want of affection between members of a family (p. 37); Lumholtz (p. 161 ff.) holds that the Queensland husband felt little responsibility for his family, and that he was really selfish and hunted only for sport, often consuming the game as caught, and bringing nothing home. The same author refers to one case of a wife being terribly beaten because she refused, one cold night, to go out and get fuel for her husband. Over against this testimony, we have that of Spencer-Gillen, referred to above, that the husband was ordinarily by no means cruel.

Of the treatment of wives and children there are conflicting reports, the more recent investigators holding that there was less cruelty than was at first represented. There was, however, doubtless much difference in this respect in different tribes. One early observer (Farq., p. 127) affirms that wives were always secured by force, the girl being seized from ambush, beaten until senseless, and thus carried off by her 'lover.' Others, in like manner, emphasize the brutality of obtaining wives (Angas, p. 222), and Lumholtz says that stealing was and is the most common method. The researches of Spencer-Gillen do not confirm these statements as far as the natives of Central Australia are concerned. Roth refers to the commonsness of the

An swallow divests itself,
ETHICS AND MORALITY (Australian)

From the North Central tribes (Spencer-Gillen, p. 608) infanticide was practised, but only rarely except immediately after birth, and then only to the mother, unless the child was unable to care for the babe. The killing of the new-born child was thus an effort at kindness; it was certainly devoid of cruelty in the eyes of the perpetrators. When the spirit part went back to the spot where it came, and was subsequently born again to the same woman. Twins were killed as unnatural—practices to be explained in part by the natives' dread of everything regarded as capable of being without order. If a young child was killed, that an older but weaker child might eat it, and thus get its strength. Howitt mentions the same practice among the South-Eastern natives (p. 749). He also says that in some places infants were eaten in especially hard summers. Sometimes, also, after the family amounted to three or four, all additional children were killed, because they would make more work and trouble than they were worth. The food of the natives for their children was noted (Palmer, loc. cit., p. 293). According to Spencer-Gillen, p. 501, children were, with rare exception, kindly and considerately treated, the men and women alike sharing the care of them on the march, and seeing that they got the water and food, and if a mother was such a sick child, refusing all food, and being incomparable when it died (p. 766). One woman carried about a deformed child on her back for nineteen years (Fraser; see Henderson, p. 121). Natural affection was certainly keen, and much grief was manifested over the loss of children.

In the aborigines' treatment of the old and infirm most observers depict them in quite a favourable light. Dawson, it is true, reports that the natives of Victoria killed them, but this is certainly not a widely prevalent custom. Lumholtz (p. 153) says that the Queenslanders were very considerable of all who were sick, old, or infirm, not killing them, as did some savage peoples (cf. Broom, p. 135). In northern Australia there were many blind, and they were always well cared for by the tribe, being often the best fed and nourished (Creed, p. 94). In the Central tribes the old and infirm were never allowed to starve. Even when an adult was assigned to the care of the older people to be provided with food, and the duty was in every case fulfilled cheerfully and ungrudgingly (Spencer-Gillen, p. 52). In some tribes the old and the sick were carried about on stretchers.

In the Daleburn tribe, a woman, a cripple from birth, was carried about by the tribe-people in torn, until her death at the age of sixty years. On one occasion they rushed into a stream to save from drowning an old woman, whose death would have been a relief even to herself (Howitt, p. 766). Fraser emphasizes the respect in which old age is held by the aborigines of New South Wales, and the fact that they never desert the sick (see also Broom, p. 152). Cannibalism among the Australian blacks was by no means a promiscuous and regular practice, as at first supposed. Lumholtz (p. 101), it is true, on only one occasion the tale he thought was capable of being least killed in fights, and oftener children who had died. An early writer reports that in South Australia bodies of deceased friends were eaten as a token of regard (Angas, p. 225), or as either a sign of regard or in ceremonial (Fraser, p. 56).

Spencer-Gillen found difficulty in gathering evidence of cannibalism being practised among the Central tribes. There were often told by one tribe that it was customary among others who had eaten farther on, and never in turn to eat flesh which others gave to be eaten by themselves. Spencer-Gillen think, in general, that human flesh was eaten as a matter of ceremony or at least for other than mere occasions. The following are some evidences of it among the Northern tribes. Howitt says that the Dieri tribe practised cannibalism as part of their burial ceremonies, and that it was a sign of sorrow for the dead. Other tribes ate only enemies slain on their raids; the Kurnai, for instance, would not eat one of their own tribe. Among other tribes, if a man were killed at initiation ceremonies, he was eaten, as was also among occasion in one of the ceremonial fights; while others did not eat their enemies.

Howitt is positive that there is no such thing among any of the tribes hitherto observed as a propitiatory human sacrifice; and he denies emphatically the statement, made current by some, that sometimes a fat gin (woman) was killed to appease their craving for flesh when they had been long upon a vegetable diet. He also says that the tribal mantis man SE, if women, and children, killed in fights or by accident, were eaten, but that there is no evidence that women and children were killed for cannibalistic purposes.

The morality of the Australian native was, in a word, the morality of tribal custom, and, if fidelity to duties so imposed may be taken as a criterion, it was of no low order. Recent investigators unite in testifying that the blackfellows, especially before contact with Europeans, was most scrupulous in his obedience to the sacred duties imposed upon him by tribal usage.

Of the Queensland natives Both declares (p. 139 fl.) that the life of the tribe as a whole seemed to be well regulated. Customs, with the old men set the standards, was the only law. Where there were few old men, each individual, within limits, could do as he pleased. Howitt (p. 770) writes of the tribes studied by him that custom regulated the placing of huts in the camp, and even the proper position of individuals within the huts. In the Kalkaba tribe, single men and women lived on opposite sides of the camp. The old women kept an ever-watchful eye upon the young people to prevent improprieties. In another tribe the women were not allowed to come to the camp by the same path as the men, a violation of the rule being punishable by death.

The law of custom thus controlled almost every phase of the life of the individual, including many personal matters as well as conduct towards others; the intercourse of the sexes is one of it was most definitely limited and regulated; the women who were eligible to each man in marriage were also rigidly determined by custom, as well as the proprieties of conduct towards the wife's family. Reference was already being made to the various severe restrictions entailed by the initiation and other ceremonies, and also to the minute regulations regarding the choice of food. In all cases these customs were enforced by severe penalties. In some tribes the local group or camp united to punish any member who was guilty of overstepping the bounds, or of complicity in more serious crimes, such as incest and murder, or the promiscuous use of fighting implements within the camp. Most customs were, however, probably obeyed from habit, the native being educated from infancy in the belief that infraction of custom would produce many evils, such as personal woes, pestilences, and even cosmic catastrophes. In fact, among the tribes observed by Howitt, authority was generally impersonal, though not always, for the headmen were often men of great personal ability, and were greatly feared and respected by the rest of the tribe or group (Howitt, pp. 295–309).

Questions of right and wrong for the Australians seem to have centred chiefly in food restrictions, secrets relating to the tribal ceremonies, the sacred objects, and wives. Moral precepts probably originated in association with the purely selfish idea.
of the older men, whereby they sought to keep all the best things for themselves (Spencer-Gillen, p. 48). In this way at least we can understand many of the regulations regarding what the younger men might eat. So also as to marriage, for, apart from restrictions as to totemism and the class into which a man might marry, all the younger men, with one or two exceptions (Spencer-Gillen, p. 31). On the other hand, delegations from distant tribes were received and treated with the utmost kindness, if they came in the recognized way. They were even permitted to take a prominent place in the ceremonies of the tribe. The relations subsisting between members of the same tribe or group were, according to Spencer-Gillen, marked by consideration and kindness. There were occasional acts of cruelty, but these were, in the opinion of the author, of something else than a harshness of character. Thus, much cruelty resulted from their belief in magic (Spencer-Gillen, p. 56, pp. 31-33). The revolting ceremonies practiced at initiation were all matters of ancient tribal custom, and hence cast little light upon the real disposition of the native.

All things considered, we are obliged to say that the life of the Australian blacks was moral in a high degree, when judged by their own social standards; and not even according to our standards are they to be regarded as altogether wanting in the higher attributes of morality. Their belief that the bear trap was the purest and most sacred of all weapons, was not founded on the value of the victim killed, but upon the principle of 'selfishness in the murder of another.'

IRVING KING.

ETHICS AND MORALITY (Babylonian).—

1. The predominating influence of religion. The civilization of Babylonia was dominated throughout by religion. Every aspect of national and civic life and every phase of human intercourse were governed by religious conceptions of the universe. The question as to the connexion between morality and religion was in Babylonia no question at all; for morality, like every other manifestation of mental life, was a part of religion. The courts of justice were religious courts; the laws always, in the annals of Babylonia we meet again and again with the same historical phenomenon: the conquering peoples receive the intellectual, and also the religious, and the ethical, impulse of Sumerian-Babylonian culture. In contemplating the ethico-religious conception of the universe which prevailed among the Babylonians, we can be excusing and trying to exterminate another one is not confirmed by those who have known them best. Their fights were probably half ceremonial, or of a sporting character, and were usually stopped when blood flowed freely. They undoubtedly did fear strangers, and a man from a strange tribe, unless accredited as a sacred man, was held in great deference (Spencer-Gillen, p. 225). The inter-tribal fights were certainly not so serious as some have represented. They were considered the most common cause of inter-tribal trouble (Lumholtz, p. 136; Spencer-Gillen, p. 32). There were no fights for superiority, no oppression of one tribe by another. Within the tribe there was, in large measure, absolute equality. There were no rich or poor, age being the only quality that gave pre-eminence (Semon, p. 225).
they are purely theoretical. We are unable to say whether the elevated morality presupposed by the injunctions of the priests was ever actually practised by any class of the people. The writers of the tablets idealize their heroes. As the august prologue and epilogue of the Code of Hammurabi give expression to religious and ethical ideas which find not the slightest echo in the actual legal provisions of the code, we may venture to assume that even in an earlier age there existed a similar discrepancy between theory and practice. Still, the theory is there; and it dominates the ritual texts even in periods of religious decadence. Lofty moral precepts in cuneiform form are uttered by the very priest who will submit to the sorriest witch and the most palpable enchantments.

2. Morality and the cult of Ea, 'the Good.'—

One of the oldest religious cities known to us is Erinda. At no period known to history was Erinda a political centre; not only the Code of Hammurabi but even the Sumerian inscriptions speak of it as an ancient and venerable city. It was situated 'at the mouth of the rivers,' i.e. at the place where formerly the Euphrates and the Tigris flowed separately into the sea. Erinda once bore the name of the God of the True (Ur-narr). The 'Good,' is Ea, and his temple is 'the house of the ocean's depth,' or 'the house of wisdom.' Ea inscribes oracles with a sacred calamus—probably beneath the oak's shade—which he sometimes referred to in the records. His wise counsels he imparts, e.g., to Adapa, 'the seed of the human race,' upon whom he desires also to confer wisdom and immortality (the head and the water of life). By his wise counsels, according to the Deluge narrative, he saves the Babylonian Noah from the flood. As the Deluge is taken to be a punishment of human wickedness, it would seem that the good Deity saved the man on account of the latter's acceptable behaviour.

The overwhelming majority of the texts that refer to Ea represent him as the god whose worship consists in the rites of ablution and incantation. He heals all manner of disease. Behind disease, however, stands the fact of sin. Although sin appears in the ritual texts as ceremonial transgression, as a conscious or unconscious revolt against ceremonial laws, yet behind this there must certainly be the idea of sin in a deeper sense—as rebellion against the Deity. The motive which prompts men to resort to the ritual worship of Ea is the desire to be cleansed from their sins.

3. Morality and the worship of Samaš.—

Besides Ea, the Good, the other Deity with whom moral ideas are specially connected is Babbar Samaš, the god who manifests himself in the orb of day, and whose principal sanctuaries were Larsa in S. Babylonia, and Sippur in the northern portion (cf. A. Jeremias, art. 'Schamash,' in Roscher). Samaš is the god of retributive justice. All unrighteousness is brought to light by him, just as all darkness melts away when his beams illumine the world.

His temple is called E-D-ka-dala-mu-nu, 'the house of the world's judge.' In a description of the New Year festival (cylinder B 18) Gudea says: 'The sun caused righteousness to shine forth; Babbar caused righteousness to shine forth. Babbar trampled unrighteousness under foot; the city shines like the sun-god.' Ur-sung, king of Ur, who presided over the worship of the sun in that ancient city of the moon, says that the sun shines in the presence of the righteous (1). His temple is called E-D-ka-dala-mu-nu (r), 'the house of the judge.'

Thus moral ideas are here personified as Divine, just as in Egypt we find Maat as the protectress of righteousness.

The moral activities of Samaš, who rewards the righteous judge and punishes the corrupt one, are set forth with great fullness in a hymn of some two hundred lines, which certainly emanated originally from Babylonia, but comes down to us in a transcript found in the library of Aš-urban-î-pal. This hymn represents the effects of the sun's activity as a continuous mystery, by means of which all evil powers above and below are brought to naught.

At thy rising, light of the land assemble;
Thy terrible radiance overwhelms the land.
From all lands together resound as many tongues:
Thou knowest their designs; thou beholdest their footsteps.
Upon thee (look) all men together.
Thou causest the evil-doer, who
Out of the depths (thou bringest those who perverted justice (2).
O Samaš by the just judgment which thou speakest (3),
Thy name is glorious, [..] is not changed.
Thou standest beside the traveller whose way is toilsome;
To the voyager who fears the flood thou givest (vouchsafe (4).
On paths that were never explored thou guidest (5),
the hunter
His mouth (to heights (5) rivaling the sun-god
O Samaš from (thy) net (6).
From thy snare (escapes) (7) not
To whom he, contrary to his oath (8) [..]
To him who does evil (9) [..]
Outshadeth is thy wise (pet).
[lifts his hand (to heaven) (10), upon the wife of his companion,
On a day not pre-ordained for him, (11) (..) takes him away (3);]
For him is appointed (12) burning, the seed (13) [..]
If thy weapon reaches him, (there is) no deliverer.
At his trial (his) case does not appear.
At the judgment of the judge, his brothers—they answer not for him.

In a heartless trap he is struck down without knowing it.
Whose devices wickedness, his horn thou destroyest.
Whose meditations oppression (3), his dwelling is overturned.
The wicked judge thou causest to pass bonds;
Whose takes a bribe, and does not judge righteously, on him thou inflict punishment.
Whose takes no bribe, but makes interference for the weak,
Well-pleasing is this to Samaš—he imparts to thee.
An upright judge, who renders righteous judgment,
Prepares for himself (a) palace; a prince's house is his abode.
Whose gives money for excessive interest (9), what does he increase?
He overreaches ( يجعله for himself gain, empties his own purse.
Whose gives money for just interest (14), who takes a shekel for (..)
Well-pleasing is this to Samaš—he increases his own life.
Whose keeps the balance (15) [..]
Whose then changes the weights (16) [..] lowers
He overreaches ( يجعله for gain (17), empties his purse.
Of the honest man who keeps the balance, many are (18) [..]
All possible things, much (..)
He who keeps the measure, who practises (..) [..]
[..] in the meadow, who lets too much paid, the course of the god, the course of the people (19);
Whose (20), his [..] demands a tax, (..) shall not possess his inheritance.
In the (..) his brothers, they shall be surety.
The (..) who gives corn for (..) who furnishes the good—
Well-pleasing is this to Samaš—he increases his life;
He enlarges his family, obtains possession of riches;
As waters of the deep, inexhaustible, so shall his seed be (inexhaustible).
He who charges (gaben) an unwise man to give good security,
He who oppresses (يجلع) his inferiors (21), he is noted down (22) with the pen.
Those who work evil, their seed has not continuance;
Whose mouth, full of lying, avails not before thee.
Thou burnest their utterance, rendest it asunder, yes, thou.
Thou hastest the down-trodden, as thou movest over them;
Thou discoverest their right.
Each one, every one, is entranced into thy hand.
Thou rulest over their judgments; what is bound, thou dost loose.
Thou hastest, O Samaš, prayer, supplication, and homage,
Submission, kneeling, whispered prayer, and prostration.
From his deepest heart the needy crieth unto thee.
The feeble, the weak, the afflicted, the poor.
With a lament (23), a piteous one, he ever appeals to thee,
He whose family is far away, whose city is a great way off.
The shepherd, with the fruit of the field, appeals to thee.
The (..) (24), in rebellion, the sheepfold among the enemy.
O Samaš, appeals to thee, as he walks on a way of terror,
The travelling merchant, the trader who carries the bag,
(..) appeals to thee; the fisher of the deep,
The hunter, the slayer, the keeper (? of cattle, 
The fowler in the . . . of the reed fence, appeals to thee. 
The fisherman, the second—though an enemy of Samsas— 
The vagrant upon the way of the desert, appeals to thee. 
The wandering dog one, the fleeting shadow, 
To Samsas, who is the lot to thee (. . . 
Thou hast not rejected those who appealed (to thee . . . J; 
Thou art revealed, for them thou, loosing (them from), 
restorest their purity. 
Those who thus render homage, their homage dost thou reject. 
But they fear thee; they reverence thy name; 
Before thy gates these men continually adore thy name.

4. The positive character of Bab. morality. 
— The Bab. conception of the universe was permeated by the assumption that morality rests upon the commandments of Deity, and hence, should the excavations some day bring to light a Bab. narrative of the Fall, it would be no matter for surprise. According to Bab. ideas, not only wisdom, but also purity and happiness, existed at the beginning of things. The mythological Creation-story of the Babylonians closes with a significant passage telling how Marduk, the victor over Tiamat, brings the laws of Ea to men, and how they are to be disseminated amongst men like a revelation of doctrine: 

'Let them be held fast, and let the "First" teach them; 
Let the wise man and the learned meditate upon them together. 
The father shall hand them down; let him instruct his son thereof. 
Let him open the ears of the herdsman and the keeper (?), 
That he may rejoice in Marduk, the lord of the gods; 
That he may prosper, and that it may go well with him. 
Meadfast is his (Marduk's) word; his decree is not changed; 
The word of his mouth is not altered by any (other) god. 
If he frowns, he turns not again his neck (to grace); 
If he is angry, if he is enraged, no god sets himself against him. 
The magnanimous, the sagacious . . . 
Against evil and sin. 
(Other five lines mutilated.)

The existence of tablets inscribed with Divine commandments is presupposed by the text K 7897, which survives in three distinct transcripts (Cuneiform Texts, xii. 39 f.; cf. Maenillan, Beitrage zur Assyriologie, v. 5, no. 2 (Leipzig, 1903); for tablet 5, cf. A. Jeremias, The OT in the Light of the Ancient East, Eng. tr., 1910, i. 292 f.). 

'Slander not, but speak kindness; 
Speak not evil, but show good will; 
Whose slanders and speaks evil— 
Unto him will Samsas require it by . . . his head. 
Open wide thy mouth, guard thy lips; 
If thou art provoked, speak not at once; 
If thou speakest hastily, thou shalt afterwards have to atone therefor: 
Sooteh (rather) by thy spirit with silence. 
Offer a sacrifice, the incense must meet (for the Deity): 
Before thy god shalt thou have a heart of purity (?). 
It is that which is due to the deity" (for continuation, see ERK liii. 747 f.).

5. The identity of moral and ceremonial law.— 
The relation between men and the Deity is determined by their qualities. It is only the wise man who is acceptable to the gods. Religion is essentially knowledge, and accordingly the intellectual interest enters largely into piety. The ideal first man is the 'keenly sagacious' Atahhidas. The will of the Deity has to be searched out. Piety consists in a submissive and unflagging performance of the ritual. The afflicted king inquires whether his sufferings are the consequence of ceremonial dereliction or of actual evil-doing. Just as, in the conception of Deity, righteousness and capricious wrath are not discriminated, so we find no distinction between real sin and ritual error. Not only may the appeal be to fate, but suffering at the holy place is regarded as a possible cause of disease, and atonement for transgression is effected by repentance and—closely associated therewith—the use of incantations. In either event, the source of the disease is sin. For it is necessary that the man who offends against the Deity by transgression should receive evil, and that the devout man should receive good. The perplexities of such a theodicy make themselves felt, but they are not, as in Israel, brought to a solution. The Divine moral law is vitiated by the utilitarian principle. The idea of love to God remains without any ethical development.

The ritual texts composed with a view to the cure of disease ennumerate with painful solicitude all possible causes of sin, but we can, nevertheless, trace the ethical idea that underlies the formula. The incantation tablets of the Surpu series exhibit the particular oaths that come under the head of sin: 

'Has he estranged father and son? 
Has he estranged mother and daughter? 
Has he estranged mother-in-law and daughter-in-law? 
Has he estranged brother and brother? 
Has he estranged friend and friend? 
Has he failed to sit a prisoner, 
Or not loosed one who was bound? 
Is it outrage against his superior (?), hatred of his elder brother? 
Has he despised father and mother, insulted his older sister 
By giving to the younger, and withholding from the elder? 
To Nay has he said Yes? 
To Yes has he said Nay? 
Has he spoken impurity, 
Spoken nonsense, 
Used an unjust balance, 
Taken base money? 
Has he disseminated a legitimate son, installed an illegitimate? 
Has he drawn false boundaries, 
Disturbed his turn, your, or small, and precise? 
Has he intruded upon his neighbour's house, 
Approached his neighbour's wife, 
Stud his neighbour's wife; 
Stolen his neighbour's garment? 
Has he refrained? 
Driven an honest man from his family, 
Broken up a well-cemented clan, 
Revolted against a chief? 
Was he honest with his mouth, while false in heart? 
With his ears was he full of Yes, in his heart full of Nay? Is it because of the injustice that he meditated 
In order to disperse the righteous, to destroy (them), 
To wrong, to rob, to cause to be robbed, 
To have dealings with evil? 
Is his mother estranged? 
Are his lips forward? 
Has he taught impurity, instilled unseemly things? 
Has he concerned himself with sorcery and witchcraft? 
Has he promised with heart and mouth, but not kept faith; 
Dishonoured the name of his god by (withholding) a gift, 
Dedicated something, but kept it back, 
Given something (for sacrifice) . . . but eaten it? 
By whatsoever thing he was bewitched—let it be revealed! 
(De it revealed) whether he has eaten anything that made an abomination for his city: 
Whether he has spread a calumny through his city; 
Whether he has brought his city into evil repute; 
Whether he has gone to meet an outcast; 
Whether he has had intercourse with an outlaw 
(Slept in his bed, sat in his chair, drunk out of his cup)? 

On the third tablet of Surpu it is assumed that a person may have been bewitched 
Because he has helped some one to justice by bribery, 
Uprooted plants in the field, 
Cut case in the thicket, 
(Because) for a day he was entranced for a coquett, and refused it; 
For a day he was entranced for a cistern, and refused it; 
(Because) he observed his neighbour's channel; 
Instead of agreeing with his adversaries, he remained their enemy; 
Polluted a river, or spet in a river. 
' These questions involve the fundamental laws of morality, such as are essential to the very conception of a civilized State. They imply that life and property are protected. In the 25th ordinance of the Code of Hammurabi it is enacted that, if one who has come to extinguish (a fire) allows himself to be bribed, but spitting at the master of the house, and appropriates the property of the master of the house, he shall be cast into the fire (HDB, vol. v, p. 600). Theft is a capital offence. Veracity is held in high estimation, and evil speaking are severely punished. Legal cases are decided by oath. Falsehood in word or thought is accounted a base thing.
ETHICS AND MORALITY (Buddhist)

2. Basis and aim; metaphysics of the good.—The fundamental principle of Buddhist ethics and morals is a very opening in the Buddha's first sermon, to consist in the Middle Path, which is, again, the way to the realization of the ultimate end—the extinction of the pains arising from egoism. Here the Middle Path is represented not solely because it lies in the middle between worldly pleasures and ascetic self-torment, but because therein lies the right or perfect (śammi, Skr. sammuk) way for realizing the ideal (dharma) and finding its true self (khaṇa) in contrast with the crooked (kuṇa); the holy or noble (ariya), in contrast with the false (micchā) or base (anārya); and it leads to the perfect enlightenment (sambodhiyāmāna, sambodhipāryaya).1 Here arises the question as to what is the content of that enlightenment. The answer is given mostly in a negative way, in the denial of the phenomenal, of human weakness, illusions, and passions—in short, in the teaching of non-ego (anatta), extinction (nirvāṇa) of pains, and the well-known nibbāna (Skr. nirvāṇa). There are perplexing questions as to the real meaning of the term 'ego.' It is negative and was led, not only by many European scholars, but a section of Buddhist thinkers, to a thoroughly negative view.2 Not entering into these discussions, we shall content ourselves with noting that Buddhism here faced the same problem as Schopenhauer did as to the ultimate nature of his nothingness (Nichts), especially in its relation with the mystic experiences of the saints, both Buddhist and Christian.3 But the distinction between the two is a very broad one. Schopenhauer consists in this, that the former was not content with the merely theoretical attitude of the latter, but, having himself realized the experience of transcending the phenomenal and entering into the height of mystic illumination, tried to lead his followers to the same attainment. This ideal of the same attainment is expressed in the term 'One Way' or 'Sole Road' (ekacent),4 treading in which is the very essence of Buddhist morality, and the basis of which is found in the stability of truths (īhālluma-tvādhi).1 In summarizing positively the highest aim of Buddhist morality, we might say that it consists in entering into the communing of all the Buddhas and Saints, through realizing the oneness and eternity of truths in one's own person. Not only insight and wisdom (dassana, vijuya), but morality and mental training are possible only on the basis of this assumption and in emulation of all virtuous acts flow from this metaphysical-source. Thus, in the Brahma-sūtra, one of the books which show most vividly the connections between practical morality and philosophical speculations, the Buddha contrasts mere works, however good and excellent, with his attainments and purposes. Having heard his disciples talking of the others' praise and blame of Buddhist morality, he teaches them not to be anxious about these trivial matters, the minor details, of mere morality (śīla-mattakas).5 The reason is not because morality is a trivial matter in itself, but because it is vain unless founded upon profound knowledge and high attainments. He says: 6

1 See Majjh. 19 (PTS ed. l. 118), 26 (l. 141-144), Sn. 38, etc.
2 There is no emphasis in the Mahāyāna of the objective world (bhāvana) and the ultimate nothingness of ego (śūnana).
4 See Art. Tattvāgata.

This was the pratīkṣa-śrīna which gave rise to the creation and explanation of the Buddha's ethical teachings (nirodhakāya in the Śūcañuka-prajñā-pāramitā (ch. 2-4), and finally to the revelation of his true personality (ch. 15 and 21).
6 Sutt. 134 (Tav. ed. l. 296), Staff, 22, 20 (4, l. 23), for which see Doctrin. Buddhist. This was the pratīkṣa-śrīna which gave rise to the creation and explanation of the Buddha's ethical teachings (nirodhakāya in the Śūcañuka-prajñā-pāramitā (ch. 2-4), and finally to the revelation of his true personality (ch. 15 and 21).

Here we can see very clearly the close connexion between morality and enlightenment in Buddhism, and at the same time the basis of its liberal and broad spirit. This characteristic of Buddhist morality is, again, closely related to its ideal of universal salvation, as shown in the missionary charge given to the first disciples and manifested in missionary works, even by the Buddha in making human beings under King Asoka's patronage. This universal ideal is further expressed by the Mahāyānists in the oft-repeated saying that "every being is a Buddha in his essential quality, and on this account the standard of a perfect Buddhist was transferred from an arhat to a bodhisattva (see below). After all, the foundation of Buddhist morality rests on the essential capacity of every person for Buddhahood; and the criterion of true morality lies in the tendency to bodhi, as attested by the one road (ekacent) trodden by all the Tathāgatas of the past as well as of the present and future time, and also the conduct of common men (pathujjana) and adopt the methods of a Buddha—that is the cardinal maxims of Buddhist morality. Though this expression may sound somewhat vague and self-evident, the latter, the good and holy life, is not to be merely talked about, but to be tested by personal touch, and realized in the exercise of the three methods of discipline as well as by the group of the four perfections. But Schopenhauer and Emerson differ in the sense that they shall find a well by the wayside; if he saw the water, but had no rope or bucket to fetch it, could he quench his thirst? 7 The answer is evident. The essential aim of any discipline or exercise is to touch the immortal region by the body (kṣiyena amatam dhatum phussayita), i.e. by personal experience and actual realization. The guide to this end is found in the person of the Buddha; hence the important rôle which high faiths found a well by the wayside; if he saw the water, but had no rope or bucket to fetch it, could he quench his thirst? 7 The answer is evident. amount to egoism. This is the original sin, so to speak, and the root of all evil, according to Eastern Buddhists. In Buddhist ethics no distinction is made between sin and ill, and their sole origin is sought not in the objective world, but in our own mind and acts (kamma, Skr. Karma).

Here again Buddhists faced the same problem as Schopenhauer, namely the isolation of the individual. The conclusion is the same as that of the German philosopher—that no reason could be sought in the objective world for this phenomenon. Or, as we might say, the question is left theoretically unanswered, and the more emphasis is laid on the necessity and urgency of uprooting the present evil that originates in the heart of the individual. The ideal of the perfected Buddhist is an individual who is completely free from the dominion of desire and who has attained a state of intense spiritual joy (sukha).

The ethical ideas of the Buddha is best described by the term 'karma'. This word is used to mean both 'cause' and 'effect'. It is in the sense of the former that it is used in the ethical system of the Buddha. The idea of karma is closely connected with the doctrine of reincarnation. In every act of the individual, there is a karmic effect. This effect may be either good or bad, depending on the nature of the act. The individual is therefore responsible for the consequences of his actions. This idea of karma, together with the doctrine of reincarnation, forms the foundation of Buddhist ethics.

Buddhists believe in the impermanence of all things, and the ultimate goal of life is the attainment of Nirvana, a state of perfect spiritual happiness. The individual, through the practice of good deeds and the contemplation of the nature of reality, can achieve this goal. The individual is responsible for his own actions and the consequences of those actions. This is the central tenet of Buddhist ethics.

A section of conservative Buddhists adhered more to the letter than to the spirit of the fundamental teachings, and found their satisfaction in self-culture. Their ideal consisted in the imitation of the Buddha, but they deemed themselves thoroughly unqualified for that perfection, and cherished the hope of being born in the good resort of the future, by the merit of their good actions. This is a question of the perfect Bodhisattva, whose merit is directed towards the perfection of an arhat, who was nothing but a Buddha in his moral perfection. But this point gave rise to a division in moral ideals and, conjointly with that, to the schism of the Mahayana and the Hinayana.

This division involved, inter alia, a schism between the idea of arhat and that of Bodhisattva (Pali Bodhisattva). The latter was an application of the Buddha in his former births, preparing for his Buddhahood, and meant 'a being seeking for bodhi.' Now this was transferred to every individual, who made progress in the religious life, and especially towards perfection, by the merit of his good actions. This is a question of the perfect Bodhisattva, whose merit is directed towards the attainment of the ideal of the Buddha, but they deemed themselves thoroughly unqualified for that perfection, and cherished the hope of being born in the good resort of the future, by the merit of their good actions. This is a question of the perfect Bodhisattva, whose merit is directed towards the perfection of an arhat, who was nothing but a Buddha in his moral perfection. But this point gave rise to a division in moral ideals and, conjointly with that, to the schism of the Mahayana and the Hinayana.

The latter was an application of the Buddha in his former births, preparing for his Buddhahood, and meant 'a being seeking for bodhi.' Now this was transferred to every individual, who made progress in the religious life, and especially towards perfection, by the merit of his good actions. This is a question of the perfect Bodhisattva, whose merit is directed towards the perfection of an arhat, who was nothing but a Buddha in his moral perfection. But this point gave rise to a division in moral ideals and, conjointly with that, to the schism of the Mahayana and the Hinayana.
possible only on this foundation of our essential fellowship with Buddha, and of the substantial identity of all life with theirs. Morality is the actualized bodhicitta, which is, again, the universal ante res of morality. In other words, the bodhicitta is the 'stability of truths' translated to the inner heart of man; it is the bodhi seen not as an attainment or acquisition, but as the original possession of man's mind. Viewed in this light, the contrast of good and bad, noble and base, among us, is due to the mutual action of good and evil; good and evil are, however, the same as bodhi and the fundamental aviyā. Thus we see in Buddhist ethics the Jewish contrast of God and Satan transferred to the inner heart of our own mind, which at the same time is substantively identical with that of all beings, including Buddhas, Bodhisattvas, and common men, as well as animals and spirits in the purgatories.\(^1\)

3. Virtues and rules of conduct; practical ethics.

Just as the contrast between the bodhicitta and aviyā is the ultimate point of theoretical ethics, the contradiction of virtues and vices forms the fundamental subject of practical ethics. Buddhist teachers are so fond of enumerations and classifications, that the classification of vices and virtues is arranged in numerical orders. This answered not only the theoretical purpose of classification, but, at the same time—perhaps much more—purposes of the practical purpose of extracting the materials according to need. This use is naively expressed, in the explanation of the seven divisions of bodhi, by a simile that robes and jewels stored in one case can be easily taken out; the various groups of virtues and vices are arranged in this way, partly for the sake of classification, and partly for the practical purpose of easily drawing their items out at any moment, when one of them is present while the associated ones are to be enticed or guarded against.\(^2\)

The fundamental classification of Buddhist discipline is, as we have seen above, the three branches of the sikkha; closely connected with this is the division of actions (karmas) or organs of works, i.e. body (kāya), speech (vāccha), and mind (manas).\(^3\) Among these the mental is the root of actions, but all the three have great influence upon one another, so that, both for repression of the bad and for acceleration of the good, the three are associated and help mutually.

Now we shall first consider the vices to be guarded against. As we have seen above, the radical vice of human nature consists in egoism, and it manifests itself in lust (kāma), desire (chanda), and intention (adhipāya). These passions manifest themselves in greed (rāga), seeking for pleasure, hatred (dosa) of pain, stupidity (moha), and hopeless indifference. These are cardinal vices, and are the three roots of the bad (akusala-mārṣa), depravities (upakāśikas), etc.\(^4\) They may further be divided into five: avaricious or charity (dana), kind word (prajñāvijaya), beneficial act (attacchariyā), and all-identification (samādhi-nattatā). These varied (rāgā) to practical life, make up the Eightfold Way, which consists in the perfection of (1) opinion (diłkhi), (2) decision (sahārika), (3) speech (vāccha), (4) actions (karmas), (5) livelihood (ājīva), (6) effort (vihāma), (7) mindfulness (sati), and (8) contemplation (samādhi).\(^5\) We see how in these classifications mental training plays a great part.

We shall not enter into the details of these items; suffice it to say that Buddhism lays more emphasis on the intellectual side than is done in Christianity, and in this respect these virtues may be compared with Greek or Confucian virtues.\(^6\) Nevertheless, faith plays the central part, as in Christianity, and this point brings us to the religious or ecclesiastical side of Buddhist morality, as we shall presently see.

Lastly, as regards Buddhist virtues, we have to speak of the pāchānātthics, the virtuous people.\(^7\)

\(^1\) Various, 35, 5; etc.; Agg. 3. 35, 69 (PTS ed. 1. 164, 701); Hc. 50, etc.

\(^6\) The cardinal virtues of Confucianism are wisdom, love, and courage.

\(^7\) Pāchānātthics are virtuous people, whose life is good, and whose mind tends to good.
to perfection or to the other shore of nirvāṇa. As we have seen above, the aim of Buddhist morality is to bring us to the ārahāna (sainthood) or to Buddhahood, to the final goal of perfect enlightenment. So in this respect every virtue is a pāramitā, but in the Pali books the term is used (not only) to designate one of the Buddha's innumerable lives in preparation for his Buddhahood. It is told in the introduction to the Jātaka 1 that the Brahman Sumedha, the future Buddha, made the promise to himself, as well as to his teacher, to express the virtue of vinasitā (wisdom) in the Jātaka, perfectly in the virtuous life of the Buddha, to bring it to the attainment of Buddhahood (buddhakārāṃ dhamma).

They are enumerated as follows: (1) charity (dana), (2) morality (śīla), (3) resignation (nekhamma), (4) forbearance (kṣantī), (5) perseverance (adhisthāna), (6) merit (metta), and (10) equanimity (upekkhā).

So the transition from the Mahāyāna system to the Bhikṣu system is a great step. Six of them are usually enumerated, viz. charity (dana), morality (śīla), forbearance (kṣantī), perseverance (adhisthāna), and wisdom (jñāna).

A résumé of a special virtue of the Buddha is given in the True Law, and is regarded by the Mahāyānists as containing the three fundamental maxims of morality. It runs:

"Any Bodhisattva, Mahāsattva, who, after the parinirvāṇa of the Tathāgata, shall set forth this Dharma-paśyāna to the four classes of beings, should do so after having entered the abode of the Buddha (the buddha-dhāma), and having put on the robe of the Tathāgata (T-cīvara), and occupied the seat of the Buddha (the buddha-sthāna).

And the delight in an immense forbearance (mekkhaṅkhuti-samākhyati), and the seed, the entrance, the vacancy of all laws (sara-dhānamuṇḍati-pratīcita-rodha).

This is exactly the same idea as is expressed in the above quoted expression, the "stepstone of the Tathāgata," etc., by transferring the pāramitā to the imitation of the Tathāgata.

We omit further comments on these classifications and their mutual relations, but we have to note that in the virtues of the Bodhisattvas more consideration is paid to those virtues that have regard to others, and that the essence of sympathy or love is more prominent than in the virtues above given.

This was, indeed, a very important point in the departure of the Mahāyāna. The Mahāyānists are wont to call the Hinayānists egoists, in contrast to the former, in which this is not literally true, the characteristic difference between the two schools, or between the ideal arhat and bodhisattva, consists in this, that, while the former sees in self-culture the first requisite of morality, the latter insists on the necessity of altruistic actions and thoughts, even for the sake of self-culture, as in the case of the Buddha's former lives. In other words, the Mahāyānist moral ideal lays special stress on the realization of the lives of the Mahāyāna, by entering into the communion of the saints through the exercise of altruistic virtues. This is, of course, an extension of the fundamental virtue of sympathy. If the authorizing of the text gave rise to another important idea, that of the dedication (parinirvāṇa) of all merits and works for the sake of others, in order to lead them to the same enlightenment. It makes it possible for all beings to help each other on the way to salvation and the realizing of the communion of spiritual fellowship. The practical results of this ideal were momentous, and we may say that Buddhist influence in China and Japan turned on this pivot, although unfortunately with its abuses as well.

The consideration of the virtues and their values leads us to the methods by which the principles under which they could be worked out. The organization for the promotion of morality is established in the Order (saṅgha), including monks and laymen, and the guidance of morality therein was laid down by the Buddha in the rules of obedience (vinaya), including prohibitions and commandments, and also necessary rules of discipline for carrying them out. Leaving the details of these rules to the special art, VINAYA, we shall here examine their general characteristics. Though the vow of taking refuge (saraṇa) in the Three Treasures and the Five Commandments (varamaṇa) are common to all members of the order, a clear demarcation is made in the rules of discipline between the Buddhist monks and the laymen or the monastic disciples in regard to the other standards of life. In this respect Buddhism may be said to teach a twofold system of morality—one that of the monks and the other that of the Lotus and the laity (lokottara); and the other that of the laity, which is worldly. A detailed description of worldly morality is given in the sermon to Sāgala, and the practice of filial piety, respect toward teachers, harmony between husbands and wives, etc., are recommended as the deeds which shall bear good fruit in one's being born in heavenly worlds. This, however, is not specially Buddhist, but generally human. To be perfectly moral, according to the Buddhist ideal, all the conditions of the śīla should be fulfilled, for which monastic life (asādāra) is a necessary condition. It is evident that the Buddha recommended the life of an ascetic (asrama) as the fittest for perfect morality, but at the same time it should be noted that the household life (āstāra) was not totally excluded from salvation. The Buddhist communion (saṅgha) is made up of the four classes of members—monks and nuns, laymen and laywomen. These four are always described as making up one body and as equally praiseworthy, when they are well-disciplined. Moreover, we hear a Brahman Vachchhaghata praise with a universal application to all his followers, without distinction of the conditions of life. The Buddha is credited with having given even so far as to say that no difference existed between a layman and a monk, when they had realized perfect purity.

1 This is stated in the Agānandacariya (Calcutta, 1888), and many other texts. Sūnaka expresses this by the word paramī, of which the source is not given.

3 Majñ, 117, Chattārāmaka.

4 Dāna, 31, Sāgala.

5 Upanisad, 5, 66, (PTSF ed. v. 243 f.)

6 Majñ, 73, Mahāvīrodbhagottana (PTSF ed. i, 490 f.)

7 Naṣik, 6, 54, (PTSF ed. v. 410.)

8 This is said in the a later doctrine (Buddha, 270, note 1). But his suggestion may be controverted by adverting other texts called the Mirror of Truth (Dhamma-vijaya), the Song of Stones, etc., where several laymen and laywomen are described as having attained arhatship, and where the different view that their attainment is evidently not due to their respective conditions of life, but to the differences of their emancipation from the fetters. Not only in the latter, but even in the former (e.g. sīlākāya) are there said to have cut off the five fetters and to have entered perfect nirvāṇa.

9 In the latter, the words "asūrya" and "aparńa" are used, while in the former (e.g. sīlākāya) are there said to have cut off the five fetters and to have entered perfect nirvāṇa. Here the words "asūrya" and "aparńa" are used. In this latter case we may consider that such upakṣetas as Chittā of Māchhakāsana, Sūri of Amabajjā, and Mahānāma of the Śikyā were in no way inferior to monks, in their attainment and purity. This cannot be denied that the Buddha allowed them the same
We may thus safely conclude that the Buddha did not make a fundamental distinction between these two classes of his disciples as to the qualification of their moral and spiritual perfection. Nevertheless, it is very evident that the moral ideal of Buddhism consists of the attainment of merit by many by means of the homeless life than by householders (on the same ground as St. Paul [1 Co 7] recommended celibacy to the followers of Christ); hence the naturally monastic character of Buddhist morality, and hence the duty of the lay followers to pay a special respect to monks.

Similar remarks may be applied to the relations between the sexes. In general, women are regarded as less capable of perfect morality, because of their natural weakness and defects, and so female ascetics (bhikkhuṇīs) have to pay special respect to those of the male sex. 1

1 Buddha was never tired of deploring the defects and vices of women, and of warning the monks to guard against them. But this should not be ascribed merely to a despising of the weaker sex, for similar warnings are given to women as regards the wickedness of men. 2 Moreover, when we consider what an active part in sexual immorality is taken by men, we are justified in saying that the Buddha was so emphatic on this point for the sake of his male disciples, because it was more necessary to make these excellent women fill their roles among the Buddha's disciples; 3 and here, again, Vaichhagotā's utterance is justified.

This brings us to consider the exaltation of lay life and the subordination among the Mahāyānisṭ̄a, a consequence of their conception of the Bodhisattva ethics. They take the former lives of Sakyamuni as the models of morality, which should be at least determined as the first origin of this change of ideal, or to assign each Bodhisattva his nativity; but we see in the Gandhāra sculpture the Bodhisattva Maitreyā represented exactly like a prince, with his guards and his attendants, as is found in Barhat and Sanche. 4 These plastic representations, literary testimonies to these changes are so abundant in the Mahāyānisṭ̄a literature that we might say that nearly every Mahāyāna book contains exaltations of various Bodhisattvas and lay saints.

Most conspicuous among many books of the kind are two texts bearing the names of Viśākha and Srimala respectively. The former is said to have lived in Viśālī, contemporary with the Buddha, and the superiority of his moral perfection and dialectic power is the subject of the whole book. 5 He is honour as the monks. These are in agreement with Vaichhagotā's utterance above cited. See Rāja Davida, Dialogues of the Buddha, p. 63.

1 These marks of respect are called the ārāmaṇa, for which see P. 27 and Aja. 56, 57.

7 The Simālāvatī-nirādham, one tr. by Ch. Ch'en in the 3rd century, and another tr. by Kumārajīva in A.D. 406 (Nanjio, no. 140).

was perfect in the practice of all the ārāmaṇas, but he lived the life of a rich man, dressed in fine robes, and drove a fine carriage, etc. His philanthropy was well known throughout the country. He was the protector of the town and the standard by which the Buddhists judged the morality of the people whom he had met and sought, whether in the palaces, or on the streets, or in gahamās and other places. He also exercised his influence over the politics of the town. Perfect practice of the ārāmaṇa in the worldly life was his aim, for which reason he also went to the Bodhisattva, and visited the Buddha, and on which account he is regarded as the model disciple among the Buddhists of the Far East, even to the present day.

Srimala was the daughter of King Prasenajit (Paścānā) and his queen, Mañjuśrī. At the age of 12 she was married to the king of Ayodhya. An obedient daughter and faithful queen, she was induced with the desire to be a Buddhist monk, and perfect in her moral practice of the Sola Hora of the Bodhisattvas. Her great vows, stated in the presence of the Buddha, and the dialogues between her and the Buddha, serve to show the capacity of lay morality, when associated with true wisdom, to take up the essence of all the rules enjoined upon monks and nuns, and to elevate and broaden them to the all-embracing morality of the Mahāyāna. 6

In short, for a Mahāyānisṭ̄a, the moral ideal consists in their essence and spirit, regardless of the circumstances and conditions of life. 7

1 Its mother, it is said, "is wisdom (prajñā), his father tactfulness (śriguṇa), his kinsmen all beings, his dwelling the vacancy (śūnyatā), his wife joy (prīti), his daughter love (maitrī), his son truthfulness (ataś), and his household life makes him not attached to existence." 8

2 These precepts should be observed both figuratively and literally, and not only to the effect of compatibility of lay morality with the highest ideal of a Bodhisattva. A Mahāyāna text entitled Brāhmaṇa-jāla enumerates all Buddhist virtues and moral precepts, and explains them in higher and lower senses and according to the spirit of the Mahāyāna, re-interpreting the prohibitions in their respective positive counterparts, and referring every rule and precept to the deepest basis and highest aim of the Buddhist life. The Bodhisattva, who is the ideal figure of the Mahayana, is, with the Buddhist Vinaya in China and Japan, and has exercised great influence upon the morality of both these nations. 9

4. Efficacy of moral practice; ecclesiastical side of ethics. 10—The basis has been established, the aim shown, and the rules and precepts given. The next question is how these could be carried out. Here the Sāṅgha plays the essential part. The Buddhist Sāṅgha in neither a mere congregation nor a society of friends or pietists; it is a religious communion and churchly organization, furnished with the disciplines necessary for the realization of the religious ideal to which the Buddhist life is aimed at. It is a church in the full sense of the word, in spirit and in name, as distinct from the Buddhist Church in Japan, on the contrary, it entered into union with the warrior spirit of the nation, and the whole Buddhist body has exercised its influence in every department of life, down to the arts of fencing, swimming, and even to the spirit and method of the Aurakzī." 11

For these see A. J. Vinaya.
efficacy for morality through the whole of the present life, and for the future as well. This is the reason why the moral precepts enjoyed by the Buddha were not elucidated with the details declared to be one of the four objects of the indefatigable faith or repose (avechha-papasada), together with the Buddha, the Dhamma, and the Sangha. These precepts are described in the formula stating the objects of faith: "The Buddha is unblemished, and the Dhamma is unblemished, and the Sangha is unblemished, and those who have become imbued with this faith are assured that they have entered the stream of emancipation (sotapatta)." Naturally, the Buddha, the Dhamma, and the Sangha are the three objects of faith, and the ceremonial and the ceremony instituted for the purpose of effectuating and assuring its practice. The āśīla, together with its inauguration act, is an indivisible whole, as the one instituted by the perfectly Enlightened, and one who has become imbued with the perfectly enlightened, and the power of the whole of the Sangha. It is also untainted and unblemished, not being defeasible by contrary powers. Therefore it is said:

It is possible that the disciples, furnished with these four things, enter into the stream, become unblemished (asriṇita-dhamma), and turn to the destiny of perfect enlightenment.

The four things mean the faith in the Three Treasures and the āśīla. The life of such men is, indeed, inexcusable (amogham jīvita)." To the Mahāyānist explanation of this source of morality we shall return.

Here we have arrived at the point where we must speak of the authority of the Saṅgha. Quite naturally, the Buddha was, during his lifetime, the sole authority and leader of morality. After his death, a kind of apostolic succession, though not unified as claimed by the Christian Church, was kept up by a series of ordaining teachers (upādhyāya, Skr. upadhyāya); and every Buddhist could return being of his ordination through the series up to the Buddha. This practice of receiving the precepts from an upādhyāya was observed, both by monks and by laymen, even in the Buddhist Mahāyāna state; and parallelly, even in this a kind of diocese was inaugurated, and is continued to this day. It is called the Śīmā (Skr. Śīmā), i.e. the circle within which the wandering monks and nuns, as well as resident laymen, had to attend regular meetings and ceremonies, conducted by the elders, during the rainy seasons. This practice was extended, in the countries outside of India, beyond the rainy seasons, and its conception developed into that of a diocese, and at last became that of a Christian church.

The emphasis laid on the efficacy (if not sacramental) of the acts for the acceptance of the āśīla and the respect for the authority performing them (Mahāyāna, PTS ed. v. 2421); also SFB xi. 27.

Sang. vi. 55 (PTS ed. v. 404.) The same thing is told in Sang. i. 11. 4 (v. 123) and Aṣā. i. 42 (v. 27, 37), 5. 47 (v. 31, 54, etc.) Here the faith is described as the virtue of faith (ehipassiko), morality (ādosa), repute (pārasa), and insight into knowledge (dvissana).

It is to this observation that we owe the tables of the Elders (Thera, Skr. Bhikkhī), who were heads of their respective branches of Buddhism. Whether these tables are credible or not, there are reasons to believe that they are of some importance.

We hear of a central seat of the āśīla at Nalāndā, mentioned in the later Mahāyāna literature as the seat of the first Buddhist university. The Madhyānta school, for instance, was the first to be established by the Bodhisattva Mahāmāyā (Sanskrit name), and is still more in India, has become connected with poetry and plastic arts. Aesthetic sense among them is derived from the source of Mahāyāna, and the creative and performative and the aesthetic sense is part of the art for art's sake used to be an inconceivable thing among them. See the present author's article in the journal cited above, and Okakura, The Book of Tea, New York, 1906.

5. Mental training and spiritual attainments.—We now come to our last subject—a peculiarity of Buddhist morality, viz. its close connexion with the methods of spiritual exercises. Though, as we have seen above, morality is enumerated side by side with wisdom and contemplation, in the three postulates, and is known by the name of the Bodhisattva morality, the qualities of wisdom and contemplation are not so close to the doctrine of the Bodhisattva morality. The precepts and the religious acts of receiving them are observed, of course with modifications, by the Mahāyānists, but they consider these to be rather vain, unless accompanied by an eager decision for the attainment of the full bodhi, and consequently consubstantiated in the deep impression of the will upon the inner kernel of their own lives, so that they are more essential for them than any act is the awakening of the radical good, the fundamental nature, we might say the matrix, from which these acts and moral practice derive their meaning. This is called the bodhisattva. The truth of the term 'bodhisattva' in the Buddhist practice, the latter should be well founded on sound principle, which again should be in accordance with the ultimate matrix.

The religious practice of the entrance to moral life is to be considered as the awakening of the Mahāyāna faith, the manifestation of the radical good; and the continual efficacy of faith and sacraments causes the bodhisattva to manifest itself more and more, and leads finally to its final realization. 'Tathāgata' is the bodhisattva, which is once awakened, its essence (prakṛti) is manifested in life, and, because the essence in itself is unmade, is of non-action (akṛti), the moral life of the initiated needs less and less exertion, and so much the more partakes in the communion of the saints. Morality, in this condition, consists in actions—bodily, oral, and mental—but they are no opera operata but inopera, so to speak. In the descriptions of the four jhānas, appamāṇa-chetasā, so often repeated in the Pāli Canon and not less in the Mahāyāna books, we can see this sense of unexerted morality, and the formula of the āśīla in the four parādhas shows this bearing, at least implicitly.

The theory of the matrix of morality played a great part in the Mahāyāna ethics and became the source of various speculations as well as of practical influences.

Chi-Hau, in his commentary on the Brahmana-śīla, expresses this point as follows:

'‘The entity (of āśīla, i.e. the jhāna) manifests itself as the essence (bodhi), and the principles (good and bad) manifest themselves in practice; the realization of the essence is induced by practice, and the perfection of practice is derived from the essence, these being things in reality one.'

This is a piece of scholastic analysis of Mahāyāna morality, and may sound very abstract, but it is intended to explain the efficiency of morality on the basis of the bodhisattva, which is identical in all beings, and thereby to lay a foundation for the practice of sympathetic acts in the essential quality of the bodhisattva. This philosophy, in conjunction with the teaching of the pāramāsā and dedication, had actual influence over the Far East converted to Buddhism, and made its morality capable of being applied to various conditions of life. It broadened the people's moral ideal so as to admit all beings to their spiritual communion, and to extend their sympathy toward even animals and plants.
ETHICS AND MORALITY (Celtic). I.

GAULT.—Among the classical authors there is a great diversity of opinion regarding the moral status of the Celts; and, inasmuch as their qualities and defects have been recorded by their enemies, the Romans, and their sympathies were naturally alienated from them, one must be careful not to attach too much importance to naive generalisations founded on superficial observation.

Thus, while Livy (v. xlv. 3) regards the heroic as the dominant feature of the character of the Celts, Cicero (pro Fonteio, xii.) asserts that they lacked all sentiment of piety and justice; and, though most authors agree that their sense of nature, Polybius (ii. 7) calls them peripatetic. Nevertheless, from the points in which the classical writers concur, we can arrive at some idea of the moral character of the Celts. As the portrait is far from attractive (Dottin, Manuel pour servir à l'étude de l'antiquité celtique, Paris, 1895, p. 117), and some modern authors contend that this is due to their religion, which, according to them, had very little influence in regulating moral conduct (Joyce, Soc. Hist. of Anc. Ireland, London, 1903, i. 220). While this may be true to a certain degree, it is nevertheless a fact that their firm belief in a hereafter had a marked influence on their moral nature, inspiring them to acts of rare bravery in which their scorn for death is manifest (Cæsar, vi. xiv. 5; Meli, iii. ii. 19). Coupled with this, is an aptitude for cleanliness exceptional among barbarous peoples tended to elevate them above the level at which one would naturally be inclined to place them.

A few traits of the character of the Celts may be indicated by way of preface, before going into detail.

Though they were easy to be convinced, and often suffered thereby at the hands of ambitious individuals (Strabo, ii. iv. 7; Cæsar, vii. xxx. 5, iv. v. 3: 'incertis rumoribus servient'), they did not lack the power of reasoning, or refuse to listen to the language of prudence (Cæsar, vii. iv. 7; Tac. Hist. iv. 69; Strabo, loc. cit. and iv. i. 5). They were eager to learn, and sought information concerning other nations (Strabo, loc. cit.). Turbulent in spirit, and having a marked aversion for order and regularity, they loved war for its own sake, the state of war being so permanent among them that scarcely a year passed without some injury being washed away in blood (Cæsar, vi. xv. 1). Inconstant, they readily abandoned their ideals and their gods, all except their character, and became so thoroughly Romanized that the emperor Julian, in his protest against their claim to be represented in the senate, was able to state that they were 'uns moribus, artibus, affiliatibus nostris mihi.' (Tac. Ann. x. 24).

I: These are the oppidana-choi-eunwaei; see Rhys Davids, Digitalis (1st ed. 1897), and Neumann, Gautama Buddha's Reden, Leipzig, 1896-1909, passim. 2 The above words are again used of, religious and moral virtues; see Alg. (PTES ed. i. 42).

4 Very noteworthy are the descriptions in this book of a Sage (or a group of teachers), to appear in the latter days to bring salvation, and of the persecutions he would endure; it contains also the assurance given by the Buddha himself and his discipites, the Buddha's realism, and his effect (SBE xxii. xxx. xiv. xii., xx.). On the last point there are deviations from the present Skt. text in Kanjmicji's tr., which led to important consequences in China and Japan.

poems ascribed to them. 1 The consequence is easy to see. It resulted in the division of the Sāṅgha into the conservative and liberal sections, and finally in the contrast between the ideals of arhatship and bodhisattva-ship. Though these divisions were not precisely the result of the different characters, we may roughly say that the former represents the tendency to self-seclusion, while the latter is daring enough to emphasize the sanctity of lay morality. The principal difference arose among the Mahāyānists themselves, the more quietistic morality being represented by the adherers of the Prajñā-pāramitā, and the activities for the salvation of all fellow-beings being represented by the followers of the Boddharmapadārāka. 2

LITERATURE.—This is fully given in the footnotes.

Ethics and Morality (Celtic)

Although it have been seen, it was uncomplaining, and celebrated hero Feigeus—an account that was known without doubt by Strabo (Leabhar na hUidhre, 65). Notwithstanding this, the Celtic women were famous among the ancients for their fidelity (d'Arbois de Jubainville, 'La Légende et les femmes,' etc., in Ecol vii. [1886] 129-144).

Polybius (xlxi. xlii.) relates the story of Chironara, the wife of the Celtic king Oigfitio, who brought to her husband the head of the Roman centurion who had violated her. When the king said to her, 'Woman, fidelity is a beautiful thing,' she answered, 'Yes, but there is something still more beautiful; it is that there is only one man alive to whom I have belonged. Deridrie kills herself when the king of Ulster, after having passed a year with her, wishes to give her up to the murderer of her husband. For the beautiful story of Cannas, wife of the Tetricus Statius, see Plutarch, Amor. xxi.

As for incest, we have in Ireland the example of Clothru, the daughter of a king, who, after having been the wife of three kings, married her own, Lugaid, supreme king of Ireland (Book of Leinster, 23, col. 2). It is permissible to conclude from a statement of Caesar that, at an early date in the history of Ireland, there existed a strict law against incest, as well as another one against brothers to marry women in common—'uxores habent deni duodenique inter se communes et maxime fratres cum fratris' (Xiv. iv. 4); and this custom existed also in Caledonia (Dio Cass. lxxv. 12; cf. lxxi. 6). The ancient Irish law of the battles of the Gauls by several classical authors whose testimony is worthy of very serious consideration, is apparently without foundation (Aristotle, Pol. ii. vi.; Diod. vii. 10; Sophocles, xlii. 80; cf. also d'Arbois de Jubainville, op. cit. 187-199).

3. Prostitution.—In spite of the ease with which the marriage vows could be violated or broken, prostitution did not fail to have its place among the Celts. The name given by the Senecus Mór to the prostitute is brittach (Anc. Laws, i. 190, 230), or merdrech (margritic), or 'female of grove and bush' (Anc. Laws of Wales, London, 1841, p. 42). A curious fact in ancient Irish law is that the head of the family, to whom the purchase-price of the wife was paid, had also a right to a share in the earnings of the prostitute (cuit in apthia bátaide [Anc. Laws of Ireland, i. 191]; Diod. ii. 66). If she had any children, she and her family were obliged to support them (do fastad cirt ocus diligd [v. 452]). If she attempted to force any man to assume charge of the child through obligation of paternity, the Senecus Mór gave him the power to refuse (1. 192).

If the minute distinctions made in the Ancient Laws in regard to rape are any criterion, we must conclude that this form of seizure was not infrequently practised in ancient Ireland. The Senecus Mór distinguishes three kinds of irregular union between man and woman. The first is called idamnonas familii, or 'union by elopement,' an open and violent seizure done with the consent of the woman against the wishes of the family. The woman in this case is called ben fastagai, or 'woman of elopement' (Anc. Laws, ii. 366, 400, 455). The second, entitled idamnonas fóitha c tátada, is a secret union formed with the consent of the woman but unknown to her family. She is then called ban forün, or 'woman of theft.' (Ibid. i. 58). And, finally, a union by violence without the consent of the woman of the family is called idamnonas ción tóitha, i.e. 'union by force,' in which case she bears the name of ben forün, or 'woman of violence' (ibid. 366, 464).

4. Women. — From what we can glean from the different authorities, the condition of women among the ancient Celts was quite miserable (Dottin, 138). Seized with the passion of what is still a sight of the day, they cultivated the soil to the women ('femine res domesticas agrorumque culturas administrant, ipsi armis et rapinis servient' [Justin, xi. 3]; cf. also Sis. Ital. iii. 344). Later on, however, under the domination of these tribes, the Celts were given great interest in agriculture (Strabo, iv. 1. 2). Although there are instances of women governing tribes in the British Isles (such as Cartismandus, who was queen of the Brigantes c. A.D. 50 [Tac. Ann. xii. 30]), the statement of Aristotle (Pol. ii. vi. 6), that the Celts were so divided from the Romans, that their King was the judge of the Continent, can still be held true for the Continent. That they were not without influence, however, is confirmed by Plutarch (de M. Virtu. vi.), who says that they were admitted into the councils of wars, and that the differences between the Celts and Hannibal agreed with his Celtic allies to let all difficulties between them be judged by the women of the Celts. The women of the Gauls were beautiful and courageous (Diod. vii. 7; Athenaeus, xii. 80); they encouraged their husbands to fight, and accompanied them on the field of battle (Polyb. v. ixvii. 1; Tac. Agricola, xv., Ann. xiv. 34, 86); at times they even displayed greater physical strength than their husbands (Ann. xii. xlii.); and, according to Strabo, they were good mothers and could do more work than the men (iv. 1. 2, iv. 3).

5. Cruelty.—The cruelty of the Gauls in war terrified their neighbours (Seneca, N. A. ii. 114). According to their national custom, they cut off the heads of the dead and wounded on the battlefield, to offer them up afterwards to the gods of Ireland. (Cithaer, de la relig. gal., Bordeaux, 1903, p. 82). Occasionally they sacrificed captives, and they are also accused of having massacred old men and little children (Diod. v. 117.; Pausan. x. 31. 1; Athenaeus, xii. 80). The heads of the Gauls were sometimes attached to the necks of their horses or fastened on the end of their lances (Livy, xvi. 18.; Diod. xix. 66; xiv. 26.), and they were held up to the enemy (Reinach, Catalogue sommaire du Musée des antiquités nationales, Paris, 1889, p. 40). They displayed with pride the heads of their chiefs or other illustrious personages, which they preserved in a preparation of oil (Strabo, iv. 5; Diod. xix. 6.). In battle their attacks were characterized by a savage fury (Pausan. x. 33.; Florus, iv. 4.; Dion. Ital. xiv. 10, 17).

Probably the most striking example of their savagery is in one of the early Irish sagas, the Solus in nos M6n D6th6, or 'History of the Pig of Mac Dolt6,' Connal Cernach, the foremost warrior of the Cuchullains, killed the hero Cét in the following manner: 'I swear by the oath that many people swear to the Cechr's regret' (i. 628). Day after day, Cét sent to me, and I therefore send to you a hound, to say (to your lord) Cét regrets that Ailill is not present to fight with Connal, the latter replies: He is here, however,' and drawing from his girdle the head of Ailill, he threw it upon the bosom of Cét with such force that a stream of blood burst upon his lips (ett tancre, ar Connid is tabait chuid LiaBHuna na-cha-chirce ocus na-foile do Chét ar a bhrusan, corraigtad a fein falsa for a bodh [Windisch, Sr. Prate, i. 104, lines 15-23]).

However convincing these accounts may appear, it is, nevertheless, true that the Gauls were no more cruel or savage than other barbarous nations, although they inspired the Greeks and Romans with such great fear that the classical authorities do not hesitate to attribute to them all possible crimes and vices (Julian, Histo. de la Gaul, Paris, 1907, 1, 332, etc.). Didomnius accuses them of violating tombs (XXII. xii.); Pausanias says that they did not bury their dead, and outraged and massacred women and children (x. 1. 7, 7); Livy asserts that they continually used false weights (x. vlviii. 9); while Plutarch states that the only law they have is that all should be the same. The sword (Cemnill, xvi.). Such accusations are only what we should expect from a people in constant dread of a powerful enemy.

6. Human sacrifice.—Probably the most serious accusation ever made against the Celts, and the Gauls by classical authorities is that they practised human
sacrifice (Lucan, Pharsal. i. 443-445; Diod. v. xxvii. 6; Livy, xxxviii. xvii.). Caesar (vi. xvi. 2f.) states that those of the Gauls who were afflicted with grave diseases either sacrificed human victims or made a vow to do so, for they believed that in a human life, the wrath of the gods would not be appeased. He adds that they were accustomed to construct immense wooden statues, which they filled with human victims and set them on fire. If the gods they sacrificed their captives as a thank-offering to the gods (Diod. xxii. ix.; Pausan. x. xxiii. 6). Dionysius of Halicarnassus, who finished his Historiae Antiquae in 30 A.D., maintained that human sacrifice was still practised among the Gauls, although it was prohibited by the Romans as early as 97 B.C. Under Tiberius (A.D. 14-37) this rite was suppressed (d'Arbois de Jubainville, Courc. ii. 270-281), although it survived in certain parts of Britain as late as A.D. 77 (Pliny, HN xxxv. 18). According to Diodorus (v. xxxii.), the Gauls kept criminals for five years before burning them on enormous pyres. That the belief in the immortality of the soul was one of the prime causes of these sacrifices is supported by the statement of Pomponius Mela (iii. ii. 19) that relatives of the dead person often threw themselves into the funeral pyre, in the hope of living with him in the hereafter. The article of the Dinnanecnua, written about the 6th cent. A.D., contains an account of the 'plain of prostrations,' showing that the bloody practice of human sacrifice was continued in Ireland probably at a very late date; and the author of this treatise states that at some period previous to his time the people were accustomed to sacrifice their firstborn to an idol called Cromm croisach ('the breath,' which stood on this field (Book of Leinster, p. 213, col. 2).

With human sacrifice is closely allied the love of suicide, which, according to the belief of the Gauls, was a kind of personal and spontaneous sacrifice to the gods. Some of the finest examples of self-sacrifice in antiquity occurred among the Celts. Brennus, believing that he was the cause of the misfortunes of his soldiers, committed suicide in order to appease the wrath of the enemy's god Apollo (Diod. xxix. ii.; Pausan. x. xxiii. 12; Jullian, Hist. ii. 359). Livy (xxxviii. xxii.) states that the Gauls scorned their wounds, enlarging them, if necessary, to make the better preparation.

7. Courage.—Among the more important doctrines taught by the Druids (q.v.) were the scorn of death and the obligation of courage (Caesar, vi. xiv. 5; Mela, iii. ii. 19). In other words, the Gauls made their theology accord with their temperament. Their very great courage, so highly lauded in antiquity (Polyb. ii. xxx. 4, xxxvi. 2; Dio Cass. xii. 1. 2f.; Livy, xxxviii. xvii. 7; Plut. Camill. xiii.), was rather a sort of fury (police Gallica) than a form of will. They considered it shameful to be attacked first (Plut. loc. cit.). On the battlefield, they were filled with anger, confidence, and pride, as they cast defiance against the enemy (Diod. v. xxix. 9); but the resistance of an adversary quickly dispelled their confidence (Pausan. x. xxiii. 12), and not infrequently they were victims of panic (ib.; Sil. Ital. xv. 710: 'patrius genti pavor'). It was their great desire to enjoy the esteem of posterity—posteri prodiunt pulcherrimam talemque famam (Caesar, vii. 75). Furthermore, more, the brave were recipients of many tokens of esteem from the tribe. For them were reserved the finest pieces of meat at the feasts, and the highest rank in life; the gallant warrior was adored as a hero (cf. the Hist. of the Perg. of Mac-Dadh, mentioned above, and the Feast of Bricriu; d'Arbois de Jubainville, Courc. v. 71-78, 80-146, 35-47).

8. Intemperance.—The Gauls were celebrated for their intemperance (Diod. v. xxvii. 3; Ammian. xvii. xii. 4; Posidon. iv. 36; Cic. de Pro Fontio); and, according to Pliny (xxii. ii. 5), it was the love of wine that caused them to make their incursions into Italy. The southern heat, combined with their excessive activity, aroused in them an irresistible desire to drink alcoholic liquors (Polyb. ii. xix. 4; Livy, xxxvi. xvii. 5: 'minime patientia sitis'). Cicero, with his usual sobriety, says that wine mixed with water was preserved by the Gauls (pro Fontio, xv.). They delighted in the invention of liquors of all kinds ('ad vini simulitudinem multispecies potus' (Ammian. xv. xii. 4)). About 100 B.C., they declared that they preferred the wines of the south, which they drank until they were insane (Ammian. loc. cit.; Diod. v. xxvi.); and it was this excessive indulgence in alcohol that finally undermined their vitality and rendered them weaker than women ('postrema minus quam feminarum' (Livy, xv. xxviii.)); Florus, ii. iv. 1).

9. Avarice and cupidity.—The thirst of the Gauls for bread was insatiable (Plut. Pyrrhus, xxxvi.; Livy, xxi. xx. 8). They violated tombs in order to secure gold (Diod. xxii. xii.; Plut. loc. cit.); they did not even hesitate to rob the most sacred temples (Pausan. x. xxiii. 6); they were so voracious that they would become mercenaries of any purchaser, and were willing to engage in long expeditions merely for the sake of pillage (Livy, loc. cit.; Justin, xxv. 2; Diod. v. xxvii.; Polyb. xvii. xx.). Yet, in spite of their love of gold, they amassed great quantities of it in their own temples as an offering to the gods, and no one dared to touch it (Diod. loc. cit.).

10. Justice.—While Cicero assures us that the Gauls were entirely lacking in the sentiment of justice (pro Fontio, xii.), Caesar (vi. xxiv. 3), on the contrary, states that certain tribes were renowned for justice and moderation; and Strabo extols their equity (iv. iv. 2). Tradition says that the Senones marched against Rome to avenge the right of the people, which had been violated by certain patricians (Livy, v. xxxvi.; Diod. xiv. xxiii.; Plut. Camill. xvii.).

11. Hospitality.—Though indirect at times, the Gauls practised all the laws of hospitality (Diod. v. xxviii.; Caesar, iv. v. 2); and, even in dealing with the most warlike tribes, Rome had no complaint to make of their treatment of her ambassadors (Livy, xxxiv. iv., xlvii. v., etc.). Anxious to learn about other people, their homes were always open to bards and strangers (Diod. loc. cit.).

12. Piety.—At first the conquered Greeks accused the Gauls of lacking piety, making of Brennus the type par excellence of sacrifice (Pausan. x. xxi.; Diod. xxii. ix. 4); but later, when they began to study their enemies, they not only admired them if they were religious, but even declared them to be the most pious of men (Justin, xxiv. iv. 3; Livy, xvi. 3; Diod. Hal. vii. 70). Caesar (vi. xi. 1) calls them a people much addicted to religious practices, for which they are praised by classical...
ethics and morality (celtic)

13. Obedience and devotion.—Especially before a common enemy, the Gauls showed absolute obedience to their chiefs, who were as one would a father (Fustel de Coulanges, La Gaule romaine, Paris, 1891, pp. 35-44); and the bonds that unite the chief to his followers are described by Polybius (iv. iv. 2), and, more particularly, Cesar did not fail to admire the devotion of the Soldati or to their chief (iii. xxii.). These men share the good or bad fortune of the one to whom they have given themselves; and, if he dies, 'there is not an example of one in this case who would wish to remain alive.' It is to their generous and sympathetic nature that this sublime devotion is due. Thus, two sons of the Galatian king Adiatorix vie with one another as to which shall lie with their father (Strabo, xii. iii. 35). Prompt in responding to all appeals for help, they rush to the defence of their neighbours (Strabo, iv. iv. 2); even an army making an invasion into Italy stops at the Alps to fasten on the bravery and the loyalty of their neighbours, while, even, in their haste to respond to a request which excites their sympathy often leads them into war. The chief, on his part, never suffered his followers to be outmatched; so, did so, he lost his authority among his people (Cesar, vi. xi. 4).

14. Pride.—Though the Gauls were characterized by their devotion and obedience, they had little regard for discipline, owing principally to their excessive vanity (Polyb. iii. xxi. 1; Polyb. iv. xxi. 2-5, v. lixiiii. 1-3; Arrian, Anab. i. iv. 6). It was this pride that rendered them incapable of profiting by experience; for, even though defeated, they were too hasty to admit their mistake and change their manner of fighting (Strabo, iv. iv. 5; Cesar, i. xiii. 2-7, xiv. 7). They defied the elements, and believed themselves dishonoured if they sought to avoid the fall of a wall (Ellian, Var. Hist. xii. 23; Stobaeus, Anthol. xiv. 41). Their vanity led them to boast (Strabo, iv. iv. 5; Polyb. iv. xxix.), and before battle the chiefs lauded the exploits of their ancestors and their people, and cast insults at the enemy (Sil. Ital. iv. 279; Cesar, vii. xxix. 6, xxx. 1).

15. Perfidy.—Though the Gauls were inconstant, changeable, and not inclined to reflection (Cesar, iii. iii. 27; Polyb. iv. iv. 2; Polyb. ii. xxi. 8, xxi. 2-5; Sil. Ital. iv. 49f.), few of the Gauls or Galatians who have reproached them with perfidy. This accusation has been brought against them only in an informal way (Polyb. ii. vii.; Cie. pro Fonteio). Nevertheless, as we might expect, rage and treachery flourished to some extent, especially in times of war. It is true that we have such traitors as Divitiac and Durnornoir, while some of the acts of Vergunctorix are certainly not above suspicion; yet, with few exceptions, they were so open and frank that they did not even use strategy, a method of warfare so honored among the Greeks (Jullian, Hist. i. 340). Their constant hating the defeated has been a factor in their success, and it seems to have been a proof against those worse defects of character (Cesar xxi. xx. 2; Cesar, iv. v. 2; Polyb. v. xxviii.); and this gaiety, which so frequently manifested itself in that of the defeated, seems to have been aroused in part by their firm belief in the immortality of the soul as well as by the pique of personal honour.

16. War, victory.—From the evidence we have from different authors, there is little doubt that anthropophagy prevailed to a certain extent among the primitive Celts. While we may have reason to refuse to accept the statement of St. Jerome (adv. Judae. ii. 7) that the Attrocities of Britain

relished certain parts of the bodies of shepherders and women, Cesar (vii. xxix. 12) makes the formal accusation that the Gauls were guilty of the invasion of the Cimbri and the Teutons, ate the bodies of those amongst whom age had rendered useless for war. Pausanias (x. xxii. 3) states that the Gauls were accustomed to cut the flesh and drank the blood of little children; and Strabo (iv. v. 4) maintains that certain tribes of Ireland had a special predilection for the bodies of their fathers. (xix. viii.)

17. Frugality.—It is obvious, from lack of evidence to the contrary, that Polybius (xii. iv.) is correct when he states that at least the Cisalpine Gauls were very frugal. Their principal food seems to have been hog-meat.

18. Murder.—It is worth noting that among the Gauls the penalty for the murder of a stranger was greater than that of a fellow-citizen (Steb. Anthol. xiv. 41); in the first case, it was death; in the second, exile. From the scanty information found in the classical authors, it is impossible to state how frequently murder was resorted to among the primitive Gauls (see, further, below, II. § 15, 13, etc.).

19. Theft.—Although the Greeks accused the Celtic invaders of all kinds of theft and brigandage (Jullian, Hist. i. 337 ff.), it is highly improbable that this was a common practice in times of peace, if we believe what the same authors say of the frankness and simplicity of their character. Furthermore, the punishment for theft and brigandage was extremely severe—the criminals were burned alive (Cesar, vi. viii. 6). If a Gaul concealed a part of the booty of war, or stole some object from those deposited in sacred places, he was put to death after undergoing severe torture (Cesar, vi. xvii.). The severity of these punishments must have tended to curb any desire of individual Gauls to appropriate to themselves the property of others (cf. also above, § 9).

20. Punishments.—It is important to note here that, whereas in later times the éric, or compensation for murder, and the punishment of thieves and other criminals, were definitely established by the legal statutes, according to the rank of the person killed (Cesar, vi. viii. 5), according to the value of the thing stolen, in earlier history it was left to the Druids to decide in such cases and to determine the punishment (d'Arbois de Jubainville, Cours, i. 105-189). As they were reputed to be the most acquired of men, no one could challenge their sentence; if he did not, he was forbidden to take part in the sacrifices (Dotin, 281). In order not to receive any injury from their contact, the society of those suffering such excommunication was carefully avoided—in other words, the criminal became an outcast from his tribe, so that, if he had any complaint to make, no justice was rendered him.

II. IRISH.—Giralduis Cambrensis, who completed his Topography of Ireland about 1187, presents a moral portrait of the Irish of that time which is far from attractive (Opera, ed. Dimock, London, 1807, v. 19). He asserts, for example, that the Irish are 'indeed a most filthy race, a race sunk in vice, a race more ignorant than all other nations of the first principles of the Faith' (xix.), and yet, when not influenced by religious prejudices, he is a very valuable source, inasmuch as he is a contemporary of an obscure period of Irish history. According to this authority, the Irish are not only inconstant, but perfidious. 'This race is likey to changeable, wily, and cunning. It is an unstable race, stable only in its instability, faithful only in its unfaithfulness' (p. 100). The following sentence is characteristic: 'Their arts are, therefore, more to be feared than their arms, their friendship than their fire-brands, their connivance than their nakedness, their treachery than their open attacks, their sanguinaryship than their seminal envy' (66). Through this oratory,
1. Marriage, immorality, etc.—On this subject, Giraldus is as severe as St. Jerome, for he asserts that the Irish ‘do not contract marriages or slum immorality’ (Book of Leinster, ed. by Henneney, Progr. boy. Ir. Acad. [1889]), which is an account of a drunken raid against Munster. Giraldus (xxvii. 172) accuses even the Irish clergy of excessive indulgence in drink.

2. Cruelty.—A most ferocious act of cruelty is found in the story of the sons of Eochaid Maigmeund, king of Ireland from A.D. 353 to 360 (Book of Leinster, ed. by Henneney, Progr. boy. Ir. Acad. [1889]), which is an account of a drunken raid against Munster. Giraldus (xxvii. 172) accuses even the Irish clergy of excessive indulgence in drink.

3. Human sacrifice.—Although Joyce (i. 239) maintains that human sacrifice was not practised at all in Ireland, we have already called attention (above, i. 6) to the account of the Mag Stoccha, or ‘Plain of Prostrations,’ to which there is another reference in the account of Tailten (now Teltown, Co. Meath) in the Binnanechns, where it is stated that Patrick preached at the great fair there against the burning of the firstborn progeny’ (Joyce, i. 281–284). This would be in accord with the Celtic law giving the father the right of life and death over his children (d’Arbois de Jubainville, Cours, vii. 244 f.; Caesar, vi. xix. 3).

4. Courage.—Giraldus (Top. Hib. x. 150) states that the Irish ‘go to battle without armour, considering it a burden, and esteeming it brave and honourable to meet the enemy at the end of their lives’ (Joyce, i. 281–284). This would be in accord with the accounts of the bravery of the early Celts as mentioned above. It may be noted here that among the Irish those soldiers who lacked courage were usually fettered in pairs to leg, leaving them free in other respects. In A.D. 250, Lugaidh Mac Con, fearing defection among his Irish allies in his invasion of Ireland against Art Oenfer, supreme king of Ireland, had them fettered to the Britons; and at the Battle of Moyrath in A.D. 637, Congal, the leader of the rebels, resorted to the same measure (Joyce, i. 143 f.).

5. Intemperance.—In spite of the fact that Cormac’s Glossary (p. 116) indicates that meæc, ‘drunkenness,’ implied ‘more of reproach than sense,’ intemperance was such a common vice that it is unnecessary to give examples here. We shall merely mention the Macc Uisn in the Book of Leinster (ed. by Henneney, Progr. boy. Ir. Acad. [1889]), which is an account of a drunken raid against Munster. Giraldus (xxvii. 172) accuses even the Irish clergy of excessive indulgence in drink.

6. Hospitality.—The Irish were renowned for their hospitality, and this was one of the principal virtues of the Irish. According to the Sancnus Mor, chieftains were bound to entertain guests without asking questions (i. 237); and elsewhere (iv. 357) cases are specified wherein a king may be excused for deficiency of food if an unexpected number of persons should arrive. The Glossary of Cormac (p. 66) gives the word eneac-ruice, ‘face-blush,’ for shame at not being able to discharge the due rites of hospitality; and the Sancnus Mor mentions a ‘flush-fine’ to be paid when one felt ashamed of the scantiness of his food (i. 123, 11). In accordance with this admiration for hospitality, free lodging-houses were established all over the country at a later date (Joyce, ii. 107).

7. Cupidity.—According to Giraldus, the Irish had a great love for gold, which they still coveted in a way that they ‘sought in the chief wildungi . . . quod adhuc Hispanico more sitian.’ (Top. Hib. x. 153).

8. Discipline.—The Irish seem to have had a certain scorn for discipline in the field, and were in this respect much inclined to the Anglo-Normans (Joyce, i. 132); but the monks, on the contrary, were characterized by their unquestioning obedience (Adamnan, 343).
9. Perfidy.—In this respect, Giraldus is exceedingly severe on the Irish of his time. 'They are so treacherous,' he says, 'more than any other nation, and never keep the faith they pledged.' Neither shame nor fear withholding them from constantly violating the most solemn oaths, 'when they have sworn to themselves,' he says, 'are above all things anxious to have observed' (xx. 160); and he concludes, 'While ancient and modern custom teaches that always carry so axes in their hands instead of a staff, that they may be ready promptly to execute whatever iniquity their minds suggest' (xx. 160).

It is probably true that, because of the frequency of its requirement, the oath fell into disrepute, with the result that the Irish, when oaths or similar religious vows were expressed in Christian times (Giraldus, ii. 52–54, iii. 331.) and the one known as the crí-cotain, or blood-covenant.' The latter consisted in drinking each other's blood, which they shed for this purpose (ib. iii. 22). and was absolutely binding. The kings of Ulidia and Ireland entered into a 'blood-covenant' in A.D. 598, when they united against Branduff, king of Leinster, at the battle of Dunblig (Recell xiii. 1892 73); on his lady's great grant of O'Curny it was so firmly respected in the western islands of Scotland that one who violated it utterly lost character (Martin, Western Isles, London, 1716, p. 109). In primitive times the oaths by the elements and by arms were the most revered (Atlantic, l. [1855] 271; Joyce, l. 383 f.)

10. Chivalry.—In spite of the accusation of perfidy borne against the Irish of their times, it is apparent from the early literature that they were little inclined to this vice. It is true that there are examples of those who did not hesitate to resort to ambush (etnarmad) or other stratagems in war, but these are rare. Thus in the battle between Aed Maic Alimmired, king of Ireland, and Branduff, king of Leinster, the latter smuggled into Aed's camp 3600 oxen carrying large hampers, in each of which was concealed an armed man (Joyce, 1. 140–149). But, on the other hand, according to O'Curry (Manners and Customs, Dublin, 1873, ii. 261), the Irish warriors never sought to conceal intended attacks, either letting their adversaries know beforehand or coming to an agreement with them. At the first battle of Moytura, the Firbolg king had to consent to the demands of the invaders for battle each day with equal numbers on both sides, although he had a much larger army (O'Curry, i. 283). Before the battle of Moylana, according to the end of the 2nd c., Owen-More, being hard pressed by Conn, the supreme king, sent to ask him for a truce of three days, which was granted (O'Curry, Manners and Customs, i. 31). In 1269, Brian Boru, granted King Malachi a delay of a month in which to muster his forces (Joyce, Short Hist. of Ireland, Dublin, 1893, p. 208). So much for history. In literature we have the beautiful story of the two intimate friends Cuchulainn and Ferdia, forced by circumstances to fight one another to death. During their duels they show each other great affection, and, when Ferdia is slain, Cuchulain falls on his sword (Joyce, Manners and Customs, i. 415). A noble example of self-sacrifice is shown in the account of the death of Alill, king of Connaught, in A.D. 519, for Cohnkille relatives, in the Annales of Ulster, that, in order to protect his fleering army from pursuit and slaughter, Alill turned his chariot and ploughed amidst his foemen, by whom he was slain.

11. Vengeance.—The Irish, like the Gauls, were always more to avenge wrongs on the tyrants of their own brothers among a barbarous race than excelses Giraldus (Top. Hib. xxiii. 167), 'Woe also to kinsmen! While alive, they pursue them to death, and when dead, to avenge their murder.' Every tribe had its airc-echt, or 'avenger of insults,' who was not slow in acting, as when Aengus of the Terrible Spear, the airc-echt of the Déise or Desi, killed in open court at Tara the son of King Cormac Mac Art who had insulted a woman of that tribe (Joyce, Soc. Hist. i. 92; see, further, Blood-Feud (Celtic)).

12. Slavery.—It is evident that Slavery in Ireland from very early times to a comparatively late date. There were three classes of serfs or non-free men, called the boidach, the senciithe, and the iorcuire. Of the three classes, there were two kinds—the airc-fuidrir or 'free fuidir,' and the airc-fuidir, or 'bond fuidir,' the latter being escaped criminals, captives taken in war, convicts reprieved from death, and purchased slave. That traffic in slaves was very great in the 12th c. is evidenced by Giraldus' account of the Synod of Armagh in 1170, which dealt with this question.

According to Giraldus (Epist. Hib. i. 13, p. 258), the Irish had long been wont to purchase natives of England as well from traders as from robbers and pirates, and reduce them to slavery. For it was the common practice of the Anglo-Saxons people, while their kingdom was entire, to sell their children, and they used to send their own sons and kinmen for sale in Ireland, at a time when they were not suffering from poverty or famine.'

13. Murder, etc.—Murder is the principal topic in the Irish law, which means that it was probably the most common of crimes. The law, however, was known and practised only outside the courts. 'At this time,' says the writer of the commentary on the Senchas Mor, 'no one is put to death (by judicial sentences) for hisintentional crimes as long as éric is obtained' (Anc. Laws, i. 15). But, if the family of the murderer wished to avoid the éric, they were required to give up the criminal to the family of the victim, who might then, if they released him, kill him with a sword (ib. ii. 69). Sometimes the murderer was drowned by being flung into the water, either tied up in a sack or with a heavy stone attached to his neck. It was thus that the Danish tyrant Turgesius was executed by King Malachi in A.D. 845 (Joyce, i. 211 f.). It should be noted that bodily harm as well as personal injury of any kind, such as a slight or character insult was punishable by a fine called dirc—a term that is very frequently used in the Ancient Laws. Furthermore, according to the Ancient Laws (v. 303), if a person wounded another or injured him bodily without justification, he, his family, or his clan was held responsible for 'sick maintenance,' i.e. othrus or folach-aethrun, meaning the cost of maintaining until cure or death. There are seven different kinds of injury enumerated by laws of A.D. 842, Brian Boru. For injury by his husband, gave her the right to separate from him (Anc. Laws, ii. 357, 359, 361, 381, 383).

14. Old age.—The respect for old age shown by the ancien Irish is praiseworthy. According to the Ancient Laws (iv. 373), 'the old man is entitled to good maintenance, and the senior is entitled to noble election' (O'Curry, Manners and Customs, ii. 301, 479, etc.). Furthermore, if the old person was destitute and had no children, it devolved upon his tribe to see to his wants; 'it is one of the duties of the clan (tribe) to support every tribe man' (Anc. Laws, ii. 55, 35; 57, 9).

15. Idleness.—Giraldus (Top. Hib. x.) states that the Irish of his time were a pastoral people, living like beasts. 'Abandoning themselves to idleness, and immersed in sloth, their greatest delight is to be exempt from toil, their richest possession the enjoyment of their plunder.' Yet (ib. xxvi. 175) he states that 'these people are intertemperate in all their actions, and most vehement in all their feelings.' 'Thus the bad are hard—there are nowhere worse; you leave in it to the good you cannot find better.' Finally, as for jealousy in the opinion of Giraldus (ib. xxxi. 179), 'they are also prone to the failing of jealousy beyond any other nation.'

16. Cleanliness.—Giraldus speaks of a tribe of
Comnaught, who did not wear any clothes, except sometimes the skins of beasts, in cases of great necessity. In the main, for the Irish, like the Gauls, took great pride in their personal cleanliness. The people bathed daily, usually in the evening (Joyce, ii. 185). Kings and princes in the habit of the day wore battle, or bathing and anointing themselves with scented herbs (for references to baths, see *I. Texte*, i. 285, 6; *RCel* xiv. [1893] 417; Hull, Cuthulinn Saga, London, 1898, p. 130, 12, etc.). According to the *Ancient Laws* (1791), the head of a family who had retired because of age was to have a bath at least once every twenty fourth night, and his head was to be washed every Saturday. Long hair was much admired, and baldness was considered a serious blemish (O’Curry, *Manners and Customs*, ii. 144). Women dyed their nails crimson (I. *Texte*, i. 79, 11); men and women reddened their faces (Meyer, *RCel* xiii. 290); and sometimes the women dyed their eyelids black (O’Curry, *MS Mut.*, 309, 309, 6). At table, they ate with their hands (*Vision of Mac Conglinne*, p. 64), though napkins were introduced as early as the 8th or 9th cent. (Zeuss, *Gramm.* C. B., Book xi. 633, 45, being called lambrat, or English *tablecloth*).

III. WELSH. —The general conclusion that can be drawn from Giralduus (*Descrip. Cambr.*), i. ch. 8, etc., and other authorities is that in the 12th cent. in Wales, like the Irish, there was a warlike pastoral people, who were further advanced in matters of intellect than in regard to material prosperity and higher morality. Giralduus states further that, in his time, they were a wild and turbulent race, dangerous neighbours, and impatient of settled control from any quarter. Wynne, in his *History of the Gwydr Family* (Osveyr, 1878), shows how late these disorderly habits continued. According to Giralduus, the Welsh were a light and active people, entirely bred up to the use of arms (i. 8, p. 170). The serious defect of their character was evidently the continual litigation about land among themselves, and their tendency to resort to the common violence of trespassing on the lands of others, that of relatives not excepted.

*Hence arise suits and contentions,* says Giralduus (Ib. ii. 4, p. 211), “murders and confiscations, and frequent intricacies, increased, perhaps, by the ancient national custom of brothers dividing their property amongst each other;” adding that the baby was not left to his destiny, but that the care of the principal men of the country was also the cause of frequent disturbances amongst brothers, terminating in the most cruel and bloody deeds.

1. Marriage, divorce, etc.—In regard to marriage, it may be stated at first that even in later times there were customs of a barbaric character which it is surprising to find surviving in a country where the Church had been established for many centuries (Ibys and Brynmore-Jones, *The Welsh People*, London, 1900, p. 212 f.). According to Giralduus (II. 6, p. 213), the Welsh did not engage in marriage until they had had, “previous cohabitation, the disposition, and particularly the fecundity, of the person to whom they were engaged. As in Ireland, the marriage tie was loose, the wife having far greater freedom than was afforded to her by the law of the Church or by the English Common Law. Whenever the husband and wife were separated, which they were allowed to do if one or both so desired, there was apparently (§ 171)"the cohabitation method by which they could be brought together again. The woman after a husband married very early—"from her fourteenth year unto her fortieth year she ought to be married," says the *Ancient Laws* (100, sec. 9); and after her marriage she "may go the way she willith free, for she is not to be home-returning" (ib.). The Laws of Gwynedd, or North Wales, recognize the influence of the Church as establishing the sanction of marriage, requiring legitimacy in the sons, and introducing a law of primogeniture true in the main, like the laws of primogeniture which did not exist in the Irish system (Skene, *Celtic Scotland*, Edinburgh, 1890, iii. 198).

There were three good reasons for which the wife might separate from her husband. One was to escape injury. ’”be leprosy, or have fildust breed, or be incapable of marital duties’” (*Anc. Laws*, sec. 10). But, on the other hand, a married woman committed any heinous crime, either by giving a kiss to another man, *vel praedeundo in podicum vel stultiturn*, the husband could separate from her, she forfeited all her property rights (ib. 40, sec. 19). That this did not operate as a ground of divorce is shown in the following passage in the *Venedocian Code* (ib. 40, sec. 171): "If the husband take another wife, after he shall have parted from the first wife, the first is free; but, if the first takes another, and she be minded to take another husband, and the first husband should repent having parted from his wife, and overtake her with one foot in the bed and the other outside the bed, the prior husband is to have the woman." But, if the wife left her husband and slept away from him (for three nights during the first seven years of their marriage, and they separated at the end of the seventh year, she lost all right to her dower (ib. sec. 9, p. 29). There is an article in the Venedocian Code (ib. sec. 70, p. 45) which shows the exceptional case with which divorce was obtained, as well as the very great emphasis laid upon the dower: "if a woman be given to a man, and her property specified, and the whole of the property had, except one penny, and she do not have, we say that the parting man separate from her on that account, and she cannot retain any of her property, for that is the single dower, which is to take away a hundred." Without entering into further details concerning divorce, it is obvious from the articles cited above that each had a right of separation, exercised without any liability, except a loss of de (possessions), varying with the time and the case, the latter being the parting for further details, see *Anc. Laws*, pp. 38-50, etc.

Polygamy was not permissible according to law, and the Venedocian Code states succinctly that "no man is to have more than one wife" (ib. 109, sec. 30, p. 54). As for the *ius primae noctis*, suffice it to say that, if it was not exercised in Wales, we have at least an indication of it in the transmission of the purchase-price (golby or amoby) by the bride’s father into the hands of the husband, at the time of the marriage, or lord (arglwydd) (*Anc. Laws*, p. 258 f.), this signifying that the right was bought back by the bride through her parent or guardian. The payment of this sum could not be avoided, for the Laws (iv. sec. 26, p. 405) state that, if a man asserted that a woman was pregnant by him and the woman denied it, nevertheless he should pay the amoby of the woman to the lord.

2. Adultery. —Provisions against adulterers were made at the time of the marriage, when the kindred or parent of the bride gave sureties that she would do nothing culpable against her wedded husband (Ibys and Brynmore-Jones, 211). The restrictions were not severe, for the penalty imposed in the case of adultery was insignificant in comparison with that imposed for other crimes. According to the *Dinefach Code* (ii. sec. 15, p. 257), "if a man commit adultery with the wife of another, he is to pay the husband his sarraad ("disgrace-price") once augmented, because it engenders family animosity." Apparently this was in the case of violence, for later it is stated (ib. sec. 37) that a man who has committed adultery with the wife of another with her consent ‘is to pay him (the husband) nothing while she is consenting; and, if the deed be notorious, she is to take to him as her husband, or the husband may freely repudiate her.’ It is sufficient to say that the Law did not consider this question a very serious one, for it states that, if a woman ‘full age’ committed adultery with a man and was afterward deserted, ‘upon complaint made by her to her kindred and to the court, she is to be entered as being for herself, having its tail shaved and greased, and then thrust through the four-score date; and if the woman go into the house that is being outside, and let her plant her foot on the threshold, and let her take his tail in her hand, and let a man come on each side of the bull and hold him, she will hold the bull, let her take it for her revengeworth (‘face-worth,’ or fine for insult) and her chastity, and it shall be a stain of her hands’ (*Anc. Laws*, p. 267, sec. 42). The penalty for adultery, like that for murder, was most
frequently some kind of compensation paid by the man committing the act to the offended husband; for, according to the Irish system, the woman whose husbands are not to have right from them for their adultery: "one is a woman taken clandestinely; if she do what she has no right to, her man is not to do right to the man who took her clandestinely; the second is, a woman slept with as a concubine, and the Irish system, the woman whose husbands are not to have right from them for their adultery: "one is a woman taken clandestinely; if she do what she has no right to, her man is not to do right to the man who took her clandestinely; the second is, a woman slept with as a concubine, and the third is, a woman of bush and brake; her paramour is to have no right from her, though she may counsel formation by taking another paramour" (ib. sec. 54, p. 200). Finally, if a man committed fornication and her paramour is to have no right from her, though she may counsel formation by taking another paramour (ib. sec. 54, p. 200). Finally, if a man committed fornication and the Law required he should be paid compensation that he might have promised to give her (ib. sec. 9, 25).

10. Incest.—Although Giraldus speaks of this crime as most common among the Welsh, the only formal accusation that he brings against them is that they were not ashamed of intermarrying with their relations, even in the third degree of consanguinity, which, he adds, was due principally to their 'love of high descent' (Descrip. Kamb. ii. 6, p. 213).

4. Concubinage.—Concubinage does not seem to have diminished to the same extent as in Ireland—possibly because of the greater freedom of the woman in the married state. In all probability the relations with the concubine were of short duration; for, a man may marry a woman until the end of seven years, thenceforward, says the Law, 'he is to share with her as with a betrothed wife' (sec. 31, p. 42).

5. Prostitution.—An important difference from the Irish system with regard to the regulations concerning prostitution is that if a 'female of grove and bush—the common term for a prostitute—gave birth to a child, its father was obliged to rear it, for the Law (sec. 33, p. 42) enacts that she should not 'suffer loss on account of the man.' The same was true with regard to the household servant, with the addition that the man had to supply her master with another to take her place during her pregnancy (ib. sec. 51, p. 45). Otherwise, the prostitute had no privilege; and, even if violence was committed upon her, she could not obtain compensation (ib. sec. 80, p. 49).

6. Abduction.—Abduction was not dealt with seriously by the Law; for, if a man abducted a virgin, 'her lord and her kindred are to take her away from him, though it may annoy him'; but, if she were not a virgin, 'there is nothing without her consent' (ib. sec. 38, p. 44).

7. Violence.—That the punishment for violence or rape was cessation is evident from the article in the Dunnean Code (ii. sec. 20, p. 255) which states that this regulation was not enacted in the law of Howel.

8. Cruelty.—According to Giraldus (Descrip. Kamb. ii. 8, p. 220), the Cymry gave no quarter in warfare, usually beheading their captives.

9. Courage.—The Welsh were a very patriotic and courageous people in the opinion of Giraldus (i. 8, p. 180):

'They anxiously study the defence of their country and their liberty; for these they fight, for these they undergo hardships, and for these willingly sacrifice their lives; they esteem it a disgrace to die in bed, an honour to die on the field of battle.'

They were so bold and ferocious that, when unarmored foot-soldiers were met with an armed force (ib.). During their first onset, they were unable to bear a repulse, being easily thrown into confusion and flight; but, though defeated on one day, they were ever ready to resume the combat on the next, either by their loss nor by their dishonour. Unlike the Irish and the early Celts, they continually harassed the enemy by ambuscades and nightly sallies (Giraldus, ii. 3, p. 210). They were able and willingness to sustain their hunger and cold, showing great resistance against fatigue, and were not despondent in adversity—in fine, they were 'as easy to overcome in a single battle as difficult to subdue in a protracted war' (ib.).

10. Intemperance.—Though the Welsh were little inclined to drunkenness, they were addicted to fast from morning till evening (Giraldus, i. 9, p. 182), they were immoderate in their love of food and intoxicating drinks whenever they found themselves surrounded with plenty. So far from scarcity of food and profanity are too severe, so, when seated at another man's table, after a long fasting (like wolves and eagles, who, like them, live on plunder, and are never satisfied), their appetite is immoderate.' The Ancient Laws prohibit the chaplain of the royal household, the judge of the palace, and the royal medicinæ from ever becoming intoxicated, for they knew not at what time the king may want their assistance (ii. sec. 19, p. 215). The only other mention of inebriates in the Ancient Laws is where it is stated that they are not amenable to law, and that all their acts are invalid (pp. 380, 387, 604, 656).

11. Hospitality.—Giraldus (i. 10, pp. 182, 183) says:

'So one of this nation ever begins, for the houses of all are common to all; and, a man may marry a woman until the end of seven years, thenceforward, says the Law, 'he is to share with her as with a betrothed wife' (sec. 31, p. 42).

12. Piety.—The Cymry were, at any rate outwardly, very religious. 'With extended arms and bowing limbs' they asked blessing of every passing priest or monk, and they also showed 'greater respect than other nations to churches and ecclesiastical persons, and to the relics of saints which they devoutly revere' (Giraldus, i. 18, p. 203).

According to the Ancient Laws (p. 201), religion was one of the seven legal qualities which a judge ought to possess.

13. Pride.—Proud and obstinate, the Cymry refused to subject themselves to the dominion of one lord and one law. Giraldus, i. 9, p. 225). They greatly esteemed noble birth and generous descent, so that even the common people retained their genealogy and could readily repeat the names of their ancestors back to the sixth and seventh generation (i. 17, p. 290).

14. Perjury.—According to Giraldus (ii. 1, p. 206), the Cymry were constant only in acts of inconstancy, cunning and crafty. 'They pay no respect to oaths, faith, or truth; and so lightly do they esteem the covenant of faith that it is usual to sacrifice it for nothing. They never scruple at taking a false oath for the sake of any temporary emolument or advantage; so that in civil and ecclesiastical causes, each party is ready to swear whatever seems most advantageous to his purpose.'

This was a necessary result of a legal system which made an oath an incident of ordinary transactions, and which multiplied the number of compurgators to an unusual degree, sometimes six hundred being required. So the trial depended on a complicated method of swearing and counter-swearing, each party concerned not by what he had actually seen or heard, but in standing by a kinsman in trouble (Rhys and Brynnor-Jones, 358).

15. Murder.—The principal indictment borne against the Welsh by Giraldus (ii. 7, p. 216) is that of murder. They were 'so little accustomed to suffer from the lengthy treatment accorded to these crimes in the Ancient Laws that they were among the most frequent to be dealt with.
**ETHICS AND MORALITY** (Celtic)

'They revenged with vengeance the injuries which may tend to injure the body,' says Giraldus (ib. p. 290), 'and, being naturally of a vindictive and passionate disposition, they are ever ready to avenge not only the recent but ancient affronts. It was usual with them to say that brothers should share affection to another when dead than when living,' adds the same author elsewhere (ib. p. 312), 'for they perceived the living yraven unto death, but revenged the deceased with all their power.' According to the Dmicetan Code (Anc. Laws, p. 197), galanusa, or murder, with its nine accessories, is one of three columns of the law.

The important fact in regard to murder among the Cymry was whether the murderer killed a kinsman or not, for the slaying of a man outside one's community might or might not be counted for righteousness, but was not thought of as wrong. While no particular penalty was attached to the killing of a member of the same tribe, the murderer forfeited his rights of kinship, and became a cercil-leadrad, or a kin-wrecked man, which meant that he became an object of hatred and was obliged to flee. The cause for this was that in the tribal system the states of individuals depended upon the alliance and interest of the whole. If he slayed his own kin, state the Ancient Laws (i. 791), 'is not killed for the sake of the dead kin, everybody will hate to see him.' It is worthy of note that, if an innocent man was killed, and no one was observed to seek justice, 'should he be killed on account of it, nothing is to be paid for him, though innocent' (Anc. Laws, p. 200; sec. 33). Furthermore, if a woman killed a man, she received the spear-penny; and this is the person who receives, but does not pay' (ib. p. 49, sec. 77).

16. Theft. — 'This nation conceives it right,' remarks Giraldus (ii. p. 207), 'to commit acts of plunder, theft, and robbery, not only against foreigners and hostile nations, but even against their own countrymen.' Theft (ladrada), with its nine accessories, is one of the three columns of the law, according to the Dmicetan Code (p. 197). Afterwards there is supplied a collection of rules relating to movable property, as well as rules for the punishment of theft and interference with a man's right of possession. In the Ancient Laws, theft is distinguished from spoliation, violence, and error (p. 124). Theft, or ladrada, is to take a thing in the owner's absence, with a denial of the act. Spoliation, or anguysforch, is to take a thing secretly, but without denial of the act. Violence, or draul, is to take a thing in a man's presence and against his will. Error, or annedoe, is everything that is taken instead of another, i.e., taking a thing one had no right to possess, or the belief that the one is acting legally. For error there was no particular fine, only a 'compensation payable to the person for his property' (Anc. Laws, p. 124). 'By the law of Howel,' continues the Venetodian Code (sec. 42, p. 193), 'for theft to the value of four pence, the thief is saleable; and, for a greater amount, forfeits his life, but not his property, 'because both reparation and punishment are not to be exacted, only payment of the property to the loser' (sec. 44, p. 192). If seven pounds were paid by him or on his behalf, he was let off; if not, he was exiled; and, if he remained in the country beyond the time allowed—a day to pass through every centref in the lord's dominions—he might lose his life unless some one bought him. There was no galanusa the (sum assessed for homicide) for a thief, nor did the Law permit a feud between two thieves, or destruction of either (ib. sec. 47, p. 123). To accuse one of theft legally, it was necessary to have seen him with the thing stolen 'from daylight to twilight,' and to swear upon a wright (verdict, usually composed of from 5 to 300 persons) that the accusation was made not 'through hatred or animosity, or for worth, or for reward, but only to show the truth' (ib. sec. 21, p. 294). We can readily see, from the severity of the punishments administered, that theft was plagued, because of its frequency, no doubt, on an equal basis with homicide.

17. Miscellaneous crimes. — The third 'column of the law,' according to the Venetodian Code, which, if it may be said, was the one which was most protected, was arson (tas, fire'). The punishment for this was death (Anc. Laws, 302). Treason was also recognized by the Law, which states that 'no galanusa is to be paid to any' (ib. p. 124). The punishment was the forfeiture of the patrimonial rights (Rhys and Brymnon-Jones, 339). The third book of the Venetodian Code states with great minuteness the worth of different limbs and members of the human body, etc. As has been pointed out in CRIMES AND PUNISHMENTS (Celtic), the distinction between civil injuries (offences against an individual) and crimes (offences against the State or community) is not developed, though for many wrongful acts the punishment is to exact fines called direvys or cambre, and for some the criminal was sold, exiled, or put to death.

18. Sodomy. — Giraldaacus accuses the Cymry of 'that detestable and wicked vice of Sodom,' to which Mailgon, king of the Britons, and many others were addicted. And he adds that, if they abstained from that vice 'which in their prosperity they could not resist, it may be attributed more justly to their poverty and state of exile than to their sense of virtue' (ii. 6, p. 215). We find additional evidence of the existence of this crime in the Dmicetan Code (p. 292), which states that the testimony of 'a person guilty of unnatural crime with man or beast' is of no effect in any case. It is possible that there is further reference to it in the Gwentian Code (sec. 10, p. 385), where it is stated that the third shame of a kindred is 'the despoothing of one's wife, being more pleased to spoil her than to be connected with her.'

19. Paternal authority. — The husband was the lord (anghelio) of his household. If his wife uttered 'a harsh or disgraceful word' to him, she was obliged to pay him 'three kine as cambere, for he is her lord.' But, if he preferred, he could 'strike her three blows with a rod of his choice length, on any part he may will, excepting her head' (Anc. Laws, sec. 5, p. 232). Furthermore, he had the right of life and death over his children, except the son after the age of fourteen, when he became emancipated, 'for the son of one lord, or lord's son, or lord's brother, or lord's lord, such as he has been educated in or by the lord, is after the age of seven' (vii. 244 f., 5). In the 6th cent. St. Teliasv saved the lives of seven children whom the father, being too poor to feed them, had thrown one by one into a river (Liber Land-escu, Llandovery, 1840, p. 120). In the 11th cent. (Venetodian Code (Anc. Laws, sec. 22, p. 103), it was common for a parent or kindred to deny a son in order to prevent him from receiving his patrimony. Finally, there were three things for which a wife could be beaten according to the Venetodian Code, (sec. 39, p. 44), to wit, 'for giving anything which she ought not to give; for being detected with another man in a covert; and for the driving of another man's beast,' he adds. 'If he chastised her for being found with another man, the Law did not permit him to have any other satisfaction, 'for there ought not to be both satisfaction and vengeance for the same crime' (ib. sec. 39, p. 44).

20. Immoderation, cleanliness, etc. — At the close of bk. i. of his Descrip. Camb., Giraldus, after stating that the Cymry were a quick, impulsive race, wanting in moderation, and indulging in extremes of conduct, resumes their moral portrait in the following manner: 'This nation is earnest in all its pursuits, and neither worse men than the
had, nor better than the good can be met with.' He notes also their wit and pleasantness. The had, however, two vice of the Irish, and they had, and that was their loose and licentiousness. They were famous for their boldness and confidence in speaking and answering, in the presence of their princes and chiefs (i. 15, p. 192). In rhymed songs and set speeches they were so subtle and ingenious that they produced "ornaments of wonderful and exquisite invention, both in words and sentences" (ib.). They loved to boast of their strength, and exulted in their ancient name and privileges (ii. 7, p. 216). In regard to their jealousy, Giraldus states (i. 10, p. 183) that, 'as no nation labours more under the vice of jealousy than the Irish, so none is more free from it than the Welsh.' Finally, the same authority contrasts the Welsh with the Irish in regard to cleanliness (Top. Hib. iii. 10). There are frequent allusions to the bath in the Ancient Laws. Both sexes cut their hair short—close round to the ears and eyes (68). When married, They took special care of their teeth, which they rendered like ivory by constantly rubbing them with green hazel and then whipping them with a woolen cloth. Their hair was also powdered, the men wearing a wig (ib.). Their only garments were a thin cloak and tunic for all seasons of the year.

IV. SCOTTISH.—Fordon, who was favourably disposed toward the Gaelic Highlanders, offers the following description of them during the 15th cent., in contrast with that of the TentrNGIBON- landers. According to him (Chron. ii. 38; Skene, Celtic Scotland 1866, Edinburgh, 1886-90, ii. 40), the people of the islands ... are a savage and untamed nation, rude and independent, given to rapine, slave-loving, of a domicile and warm disposition, commonly in person hospitable in dress, and to the English people in language, and, owing to diversity of speech, even to their own nation, and exceedingly cruel. They are, however, faithful and obedient to their king and country.

The correspondence of a visitor in 1726 shows that after five centuries their character had little changed (Skene, iii. 324 f.). According to this account, they esteem the most sublime degree of virtue to love their chief and to pay him a blind obedience. Next to this is the love of the particular branch from which they sprang, and, in a third degree, the love of the whole clan, to whom they will assist, right or wrong, against those of any other tribe with which they are at variance. And, lastly, they have an adherence to one another as Highlanders, in opposition to the people of the Low country, whom they despise as inferior to them in courage, and whom they believe they have a right to plunder whenever it is in their power. During the first half of the 18th cent., half of the Highlanders passed an idle life, using blackmail as their main resource. Half of the men stole, in order that the other half might be employed in robbing (Lang, Hist. of Scotland, Edinburgh, 1802, iv. 374). If we compare this portrait with that traced by Dio Cassius of the Caledonians, or Northern Piets, we can readily see that time effectuated little change in their character. According to this authority, these tribes were a pastoral people, living principally by hunting. 'Naked and unshod, they had wigs in common. They were great thieves, "looted most literally... and they were sick in common' (Lang, i. 10).

1. Marriage.—In the early period, 'the sanctions of marriage were unknown, and a loose relation between the sexes existed' (Skene, iii. 138). Among the tribes of Northern Scotland, community of women was so frequent that two or more women generally brothers or a father with his sons—had wives in common (Lang, i. 4). Annual marriage, or 'hand-fasting,' existed in the Highlands until the 16th century (Fordun, iv. 216). The chiefs agreed that the son of one should marry the daughter of the other. If, at the end of a year and a day, the young wife had not yet given birth to a child, they owed their lives, and nature of the parties was permitted to marry again (Skene, The Highlanders of Scotland, ed. Macfain, London, 1904, p. 108 f.). The jura prima noctis was exercised in Scotland from very early times; according to Buchanan (Annals Historiae Scotiae, 1697, pp. 99, 200), it was abolished in the 11th cent. A.D. by King Malcolm III.

2. Immorality. — Bede, who wrote about A.D. 687 or later, noted the "vandal disposition of the Scots" (Lang, i. 72). In later times illegitimacy was prevalent amongst the royal family, the nobles, the clergy, and the people. Robert I., Robert II., and Robert III. had as many as 14, 15, and 16 children, and the Crown was much weakened by the large number of children whom Robert II. had by his two wives, besides many sons and daughters of illegitimate birth (J. Mackintosh, Hist. Civilization in Scotland, Paisley, 1892-96, i. 426). Although, in 1528, Parliament attached a severe penalty to the crime of rape, it was often passed over with a very light punishment. Bigamy and adultery were commonly offences in Scotland, but Parliament enacted a measure which proposed severe penalties against them. Divorce was also extremely common among the upper classes (ib. ii. 229).

3. Intoxication, idleness, etc. — Drinking of liquor was always very common in Scotland, and Parliament passed numerous acts against this habit, but to no avail (Mackintosh, i. 415). During the 15th cent., the country was overrun with beggars and vagabonds, in spite of the efforts of Parliament to suppress them (ib. 422 f.).

4. Murder. — As in Ireland and Wales, there was a system of blood-feud. In the Middle Ages, Edinburgh, 1860, p. 192). Until the Reformation, murder and manslaughter were extremely prevalent throughout the Scottish kingdom; and, although many Acts of Parliament were passed for putting an end to these crimes, they seem to have produced little effect. When criminals were convicted, they were often pardoned, and so many pardons were granted that in 1542 Parliament was obliged to interfere (Mackintosh, i. 425, ii. 228).

5. Theft. — Gallio, who wrote about 500, calls the Piets 'a set of bloody freebooters with more hair on their thieves' faces than clothes to cover their nakedness' (Lang, i. 15). In the 12th and 13th centuries, if we believe Fordun (Chron. iv. ed. 1572, ii. 2213), the native population would not, for either prayers or bribes, or oaths, leave off their disloyal ways, or their ravages among their fellow-countrymen. In the 15th cent., theft and cattle-raiding were the most frequent crimes, against which Parliament acted in vain (Mackintosh, i. 427 f., ii. 228).

LITERATURE. — This has been sufficiently indicated in the article.

JOHN LAWRENCE GREGG.
ETHICS AND MORALITY (Chinese).—If we are to write of Chinese ethics, we must have in view only the ethics of the Confucian school; for China has no other system. These moral laws, rules, and principles are aptly depicted in the classical literature which for ages past has formed the one subject studied by every scholar throughout the length and breadth of China. Not only are they accepted not only by education but uneducated, but they have helped to mould the social life of the people, and have coloured and influenced the national legislation and administration. As religions, Taoism and Buddhism have established themselves by the side of Confucianism, doubtless because they better satisfy that desire for something beyond the present life which is so common and so natural to the human mind, but the morality which they inculcate is entirely borrowed from the Confucian system.

Though Confucius has given his name to a school, he did not claim to have founded one. He said of himself, "Among the people I am perhaps somewhat more learned than an average person," though he was "a transmitter and not a maker, believing in and loving the ancients" (Confucian Analects, vii. 1). Of an eminently profligate and practical turn of mind was never more graphically illustrated than in the characteristics of virtue or of drawing distinctions between right and wrong in actual life; but he cared little to speculate on the nature of the moral faculty or any such questions. We know, however, that he considered virtue to be a mean between two extremes, to which some fail to attain, while others go beyond it; and he held the fault of excess to be as bad as that of deficiency (Chief Analects, vi. 27, xi. 15; Doctrine of the Mean, iii., iv.).

These ideas are elaborated in the treatise called The Doctrine of the Mean, which contains many quotations of Confucius's words, and is believed to have been written by his grandson. The treatise further declares that man receives his nature from heaven, and, when he acts in accordance with his nature, is following the proper path, from which he must not wander for an instant (op. cit. i. 1-3). Here we find a principle disclosed, concerning which Confucius never expressed himself with definiteness, but which for many generations occupied the minds of his followers more than any other. That man's nature is what we call his character depends to a great extent on the education he receives, and this is the work of the father and/or the school, which was under the control of the state; hence the knowledge of the state that character is what is important and the child should be educated with this in mind.

The doctrine of the goodness of human nature had its most powerful advocate in Mencius, the greatest of all the learned men who owned Confucius for their master. In his day a certain philosopher, Kao by name, urged that man's nature is neither good nor bad; but any one may be led to practise either good or evil, just as water, when one makes a hole for it to escape by, has no preference for east or west, will flow in either direction indifferently. Not so, replied Mencius, when asked his opinion as to this: though water is indifferent to the compass of a vessel, its tendency is to flow downwards, and only by force can it be made to rise; so the tendency of man's nature is towards what is good, and doing evil is contrary to his nature (Mencius, vi. pt. i. 2). Then another theory was brought to bear on this notion—that the nature of some men is good and that of others bad. To this he makes answer with a more serious argument. In saying that man's nature is good, his meaning he explains, is that 'from the feelings proper to it, it is constituted for what is good'; and, if men do evil, it is not the fault of their natural powers. Every one has the feelings of pity, shame, of reverence, of approbation and disapprobation, i.e. of appreciating right and wrong. Thus, as he said on another occasion, every one, no matter who, will feel alarmed and distressed if he suddenly sees a child on the point of falling into a well. And this will be a genuine sensation; it will not be merely that he desires to gain either the friendship of the child or the approbation of his own friends, nor yet that he dislikes seeming to be callous. Hence it will be evident that there is no man without the feeling of pity; and it is this same view with regard to the other feelings (ib. vi. pt. i. 6, ii. pt. 1. 6). Mencius proceeds to show that a few sages had existed who lived perfect lives; and other men might be like them if they chose, for a perfect life consisted in simple acts which every one was physically able to perform. It was not that men could not do these acts, but simply that they did not do them. People were led into evil because they allowed themselves to be influenced by surrounding circumstances; thus, for instance, in years of plenty the common folk were mostly well-behaved, but in time of dearth they became lawless (ib. vi. pt. ii. 2, vi. pt. i. 7).

Though the doctrine of Mencius has found final acceptance and has been adopted by all Chinese, it was not until the 18th century that it was challenged at first. Soon after Mencius's time a distinguished scholar, named Hsün Ch'ing, maintained with much force that human nature is evil. He appealed to the fact that men are not good spontaneously, and that they are made so only by teaching and by the laws. Eyes can see, ears can hear, naturally; they do not need instruction to enable them to do it; but men acquire righteousness only by learning and hard effort. Again, when a man is tired or hungry, his natural inclinations prompt him to rest or to eat; if, instead of yielding to them, he gives place to his father or his elder, he acts rightly, but it is against his natural inclination. Indeed, the mere fact that a man wishes to do right shows that righteousness is not natural to him.

There remained one more theory to be brought forward—that our nature is partly good and partly evil. This was upheld by the philosopher Yang Hsiung, who lived during the time of the Christian era. He taught that man's progress in either direction depends on the development of the good or the bad part of his nature, according as he is influenced by his environment.

Besides The Doctrine of the Mean, among the recognized Chinese classics there is another ethical treatise which is entitled The Great Learning, and among its subjects are the practice of virtue and the art of governing. This treatise, which is extremely short, is most highly praised by the Chinese for its profound wisdom, and is perhaps studied by them beyond all their other canonical books. Modern authorities ascribe its opening and fundamental chapter to Confucius himself; but for more than fifteen hundred years, probably with greater correctness, it was held to be by another hand. In any case it is substantially in accord with Confucius's views, and must have been written not long after his time. At its commencement is a description of what man is said to be the proper mentor of the ancient princes for promoting virtue throughout the Empire:

'The object of the ancient Chinese statesmen was to govern well their own subjects. In order to govern well their subjects, they first regulated their own families. In order to regulate their families, they first practised virtue in their own persons. To arrive at the practice of virtue, they had first purified their hearts. In order to rectify their hearts, they first sought for sincerity of thought. In order to obtain sincerity of thought, they first extended to the utmost their knowledge. The extension of knowledge lay in the investigation of things.'

The processous consists in a succession of steps, by the first part of which the individual may arrive at personal virtue, and by the second

2 Legge, op. cit. vol. i. (1855) p. 367; W. A. P. Martin, Life of Cathay, vol. VII.
part, the individual being a ruler, virtue may be promoted throughout the land. What is to be understood by the first step of all, the ‘investigation of things’? According to the greatest of Chinese commentators, it means ‘investigating the principles of all things; we must come into contact’ (Great Learning, Com. v. 2). This, verily, is no small task to impose upon the seeker after virtue. The third step, sincerity of thought, is explained as being a method of following of, the good, not a mere doing of what is right from inferior motives (ib. vii.). But there seems to be little distinction between this and the next step, rectification of the heart. In the later portion of the chapter, one notices how good government is made to spring from the personal excellence of the ruler. This was a favourite point with Confucius, who repeatedly insisted on the necessity of a good example being set by those who govern. Once, when asked by a certain ruler how to deal with the prevalence of robbery, he went so far as to reply: ‘If Your Excellency were not covetous, your people would not rob, though you paid them to do it’ (Conf. An. xii. 10).

It was as a teacher of practical morality that Confucius won his fame. But he left no treatise on the subject; nor did he ever handle it systematically. We have disconnected utterances, which were collected and recorded by his followers or appear as quotations in later writers. The Confucians hold that there are five virtues (the, or that virtue consists of five parts: jen (charity), li (righteousness), li (propriety), chih (wisdom), hsin (sincerity). Perhaps the best idea of the sage’s teaching will be given by grouping under these heads a few specimens of practical examples:

1. Jen—the virtue of man’s relation to man, charity (in St. Paul’s sense), benevolence, humanity. The descriptions given by Confucius of this quality vary according to the occasion and the questioner. The most concise is that it is ‘to love all men’ (Conf. An. xii. 22); the most elaborate, that it consists in the practice, without intermission, of respectfulness, indulgence, sincerity, earnestness, and kindness (ib. xvii. 6). To another inquirer it was said to be found in reverence and the observance of the Golden Rule—not to do unto others what you would not wish done to you. A great case in point, he declared, twice or three times by him, and once he gave it as sufficient alone to serve as a guide for one’s whole life (ib. xii. 2, xv. 23). A man may be pure, be loyal, be capable, and yet not worthy of being called jen: Confucius disapproved for himself any right to be so considered (ib. v. 7, 18, xvii. 33). Charity is founded on filial piety and fraternal submission; and, if rulers behave properly to their relatives, the people will be roused to charity (ib. i. 2, viii. 2).

2. Li—righteousness, justice, duty. This is especially the virtue of public life. Thus, to refuse to serve one’s country is a failing in duty (ib. xvii. 7). The prince must be just in laying burdens upon his people; if he be so, they will willingly submit to his rule (ib. v. 15, xiii. 4). If righteousness be absent, courage only leads men of high position into rebellion, and those of low position into brigandage (ib. xvii. 23). Without righteousness, riches and honour are but a floating cloud (ib., vii. 36, xlv. 6).

3. Li—propriety, combining with it an idea of ceremonialness. It is worth nothing without charity; it must be accompanied by reverence; and it does consist in gorgeous array (ib. ii. 3, 26, xvii. 11). If it is joined with a spirit of forwardness rudeness (ib. viii. 2). Without a knowledge of propriety a man’s character cannot be established; and combined with study it will keep one from erring (ib. viii. 8, xii. 15).

4. Chih—knowledge, wisdom. The most important kind of knowledge is the knowledge of men (ib. xii. 22). A man ought to know what heaven commands (i.e. what is right and what is wrong); he should also know the rules of propriety; and, thirdly, he should be able to estimate the character of those who speak with him (ib. xx. 3). When one knows a thing and recognizes that one knows it, when one does not know a thing and recognizes that one does not, that is real knowledge (ib. ii. 17). Attempts to acquire virtue will fail if not accompanied by study (ib. xvii. 8). One should learn for the sake of one’s own improvement, not to win approbation (ib. xiv. 22). To study without thinking is labour lost; thought without study is dangerous (ib. ii. 15). Confucius once said: ‘I have passed the whole day without eating and the whole night without sleeping; I do not think of mere uses; the better plan is to study’ (ib. xv. 30). But, after all, knowledge of the truth is not equal to the love of it; and the possessor of literary acquirements is a useless man if he be devoid of practical ability (ib. vi. 18).

5. Hsin—sincerity, truthfulness, belief. The necessity of this virtue is inculcated in many passages. Faithfulness and sincerity should be one’s first principles; without truthfulness no man can get on (ib. i. 8, ii. 22). In intercourse with friends, one must above everything be sincere; and it is disgraceful to pretend friendship with a man whom one dislikes (ib. i. 4, v. 12). Sincerity is one of the requirements of a ruler (ib. ii. 5).

As we have seen above, Confucius, living in the 6th cent. B.C., inculcated the Golden Rule of our Saviour, which has been described as ‘the most unshaken rule of morality, and foundation of all social virtue.’ On the other hand, there is one well-known instance where he distinctly falls short of the standard of Christian benevolence. When asked what was his opinion as to the repayment of injury with kindness, he replied, ‘With what then will you repay kindness? Repay injury with justice, kindness with kindness’ (ib. xiv. 36). On another occasion, also, in reply to an inquirer, he declared he had created seven great sons besides himself. ‘If I am the father, the son must be ready to slay the murderer whenever and wherever he may meet him. This conversation is no doubt authentic, though it does not rest on such a high authority as the Analects.

Filial piety cannot be left unmentioned by any one dealing with Chinese ethics. It is often coupled by Confucius with the somewhat similar, but less important, fraternal affection or submission which a younger brother owes to an elder. These two duties formed the corner-stone of both the ethical and the social system of Confucius. For in his view, not only are they the foundation of charity, the greatest of all the virtues, it is by practising them that the people learn to be obedient to the government and the laws. Filial piety is said to consist in serving parents, when alive, according to propriety, and, when they are dead, in burying them according to propriety and in sacrificing to them according to propriety. Reverence and willingness in service are requisite; moral performance of duties is not enough (ib. ii. 5, 7-8).

The worship of ancestors, that great offshoot from filial piety, was, as practised by Confucius, merely a commemorative rite. There is no sanction from his writings respecting its features at the present day, namely, the transformation of the deceased into tutelary deities,
and the absurd doctrine that the fortunes of a family are determined by the location of its

and the absurd doctrine that the fortunes of a family are determined by the location of its
tomb. One charge which foreign critics have made against the Chinese is that it sanctions and encourages concubinage.

There is truth in this. In China the practice of taking concubines is extremely common among the upper classes, but the occupation of them with concubines is disapproved, except where a wife is not likely to bear a son. In such a case the necessity of having male descendants to continue the ancestral line is admitted. In the opinion of all Chinese, completely justified concubinage, even though it is possible to avoid the practice by the introduction into the family of an adopted child.

LITERATURE.—The Chinese ‘Four Books’: (1) The Lun Yü, or Analects of Confucius; (2) Mencius; (3) The Ta Hsiao, or Great Learning; (4) The Chuang Yung, or Doctrine of the Mean.

T. L. BULLOCK.

ETHICS AND MORALITY (Christian).—

1. HISTORY.—There is no formal science of Ethics in the NT. The NT presents a life-giving Personality, the Source and Norm of Christian Teaching, dominant. His teaching is not limited to His spoken words; it is an ever-present continuous work. This is taken for granted by the NT writers. Hence we can speak of a real progress in Christian thought concerning conduct. Because Christ is the Fulfiller of Hebrew revelation, the OT is of special, though subordinate, value. As Christianity spread to Greco-Roman soil, Christians, because of their cosmic view of Jesus’ Person, appropriated from their new surroundings whatever helped their spiritual life. The history of Christian morality is thus a record of how the Spirit of Christ has been endeavouring to redeem all life to its own service, and the record is still unfinished.

The Didache, the Epistle of Barnabas, and the Apostolic Fathers show the predominance of the religious-ethical interest, but the beginnings of legalism and externalism are also manifest (Pastor of Hermas). The dogmatic interest gradually submerged the ethical; and ascetic withdrawal from the world and superiority of knowledge to faith introduced a division of labour into morality, hence the distinction between honestum and usile, between constantia and mandata.

In the Alexandrians, such as Ambrose in the West, the ideas and terminology of Hellenism are influential. The organized Church became a law-giving source (Cyriacan), and legalism suppressed spiritual spontaneity. The recognition of Christianity by the State deepened this influence. In Justin, Clement, and the Alexandrians generally we see the rationalistic and inclusive tendency of Christian thinking; in Tertullian and the West, its legalistic and exclusivist tendencies. Notwithstanding the recognition of asceticism, virginity, baptism, and the Eucharist as means of salvation, there existed a vigorous new life of brotherly love and martyr courage.

Augustine is the greatest of the early moralists. His conversion had supreme influence on his teaching. In him are found the germs of the various medieval tendencies. His teaching on sin and atonement as the ground of the allegiance and the supremacy of God as Highest Good, and on virtue as ordos amoris, influenced not only Gregory the Great, Isidore of Seville, and more especially Aquinas, but also the preachers of the Renaissance, the Mystics and Quietists.

The Middle Ages added the Corruptions of the Papacy and its Inquisition, the Monasteries, the sale of Indulgences and the Inquisition, the Monasteries, the sale of Indulgences and the sale of Indulgences.

(The Thomists and Scotists, and were rich in casuistic and penitential books. Petrus Lombardus’ 3rd book of Sentences was an influential moral treatise. Aquinas’ supplement, Summa Theologiae, extended the Thomistic theology and the thought of Aristotle supply the foundation for evangelical Ethics, and the distinctiveness of Christian morality is regarded as a revealed ethic as part of the word of God.)

A new era began with the Reformation. Faith became personal trust in God, the value of the individual was recognized, and ordinary vocation were regarded as the true sphere of moral life. But its greatest work was the placing of the Scriptures in the hands of the common people. Problems as to the relation of the individual to the State, and of the State to the Church, now arose. There was also a tendency to separate philosophical and Christian Ethics (Melanchthon and Kekermann), though Ameeus insisted on Ethics as purely theological. The Counter-Reformation produced Jesuitic casuistry (p. 11)—against vigorous individual protest (Innocent). The merit of having separate two is usually ascribed to Dunsus and Schinutz.

While Rom. Cath. Ethics largely followed tradition and casuistic refinement in dealing with cases, Protestant Ethics tended to be moulded, from this time onwards, by the current philosophies, and, within the various Churches, by the authorized Confessions of Faith.

Rationalism and Deism (Wolf, Lessing, English Deists) made reason supreme, and the source of inductive truths; Christianity was an awkward republication of innate moral principles.

Theories as to the origin of the moral sense, natural rights, and sanctions exclusively interested moralists. Biblical Ethics was neglected or confused through the equal valuation of the OT and the NT. Butler deserves mention, because of his insistence on conscience; but it was Kant who rationalized and individualistic utilitarianism. Schleiermacher offered morality in the customs and institutions of the community, and may be regarded as the father of modern socialism. His influence tended to make the Church a part of the State and to intellectualize and individualize morals. Schleiermacher’s interest was the distinction of the subjective consciousness, and on the value of feeling; he occupies in modern Christian Ethics the place that Kant occupies in the philosophic world; he was largely influenced by him; Martensen occupies a mediating position; while I. A. Dorner is speculative and Biblical. The Ritschlian school aims at safeguarding the Christian ethical values—against the scepticism of history, the conservatism of dogma, and the lack of novelty introduced by science.

The influence of the inductive sciences and of evolution raised questions as to the origin of a system of science, and attempts were made to explain morality genetically and associationally. The question of origin is, however, distinct from that of value. The historical study of Scripture has cleared up difficulties in the Ethics of the OT, and has enabled moralists to distinguish between principles and their historical setting in the NT, while it has helped to reveal the distinctiveness of the Christian life. Dogmatic conversion has, in fact, been in favour of an ethical basis for unified action in dealing with grave social problems (Ethical Societies). The Unitarian school emphasized the supremacy of conduct over dogma, and can claim many distinct qualifications of the various revival of religion has made prominent the power of Christianity in renewing life, and at
present it is laid on the psychology of the Christian moral life and the supremacy of the will, which is felt to be beyond the control of a personal relation to a moral being, and control can do not a little to develop and safeguard morality.

Till recently there was a general tendency even among Christian philosophers to regard the moral teaching of Jesus as perfect, as far as individual life was concerned, though defective on its social and political side. Lately this has been denied from without and within (Nietzsche and the Intemisthik school). On different grounds, and with different results, we are coming to see that the Christian life is bound up with the Christian revelation, and that the ideas of philosophic Ethics or historical theories must not be used so as to crush out the distinctive vitality of the Christian life of faith. Recognition of spiritual facts is more valuable than systematic completeness, and defective views of Christ's Person are found to revenge themselves on Christian morals.

II. DEFINITION AND SCOPE.-(a) Christian Ethics, analytically defined, is the science which deals with (1) what the Christian man (individual and social), and the Christian destiny (sumnum bonum), (2) what he ought and ought not to do (Duty), and (3) what moral power is necessary to attain end and accomplish duty (Virtue). The Christian life, however, is an organic continuum, and any analysis of its contents must be to some extent artificial; but, if we guard against overlapping and repetition due to this trichotomy, we may, for clearness of exposition, adopt it. (Schleiermacher, Paulsen, and A. J. Dorner adopt this analysis for philosophic Ethics; Rothe, Lange, Kraus, and others, for Christian Ethics.)

(b) Classificatory viewed, Christian Ethics is defined by its place in the theological encyclopedia, its boundaries delimited, and its organic relations with the totality of Christian thinking determined (Flint, art. 'Theology,' in EDB; cf. artt. in theological encyclopedias). We cannot do more here than mention this way of looking at the science. The present age is anti-dogmatic and anti-metaphysical, and the central position of Christian Ethics, as of Ethics in general, is more and more recognized. This tendency is against confessional and dogmatical Ethics. Men ask rather, 'How much must we believe to live the Christian life?' (Kraus, Christian Ethics) and this presupposes the Christian revelation—the matrix alike of both Ethics and Dogmatics—and is organically bound up with it (see Findlay, Pernley Lectures, London, 1894, for a fine treatment of Christian Ethics from this point of view).

(c) The science may be defined also by comparison and contrast with other views of life. Some views of life are inimical to Christian morality, others are preparatory and propedient. The task of the Christian moralist is in this region wider to-day than was that of Clement or Tertullian, Augustine or Aquinas, Melanchthon or Calvin, because, thanks to the vast missionary labours of modern times, new systems of life have come before the mind of Christendom. As a practical science, Christian Ethics must take note of earnest ethical speculations, both within and outside the Christian Church. In this way it becomes conscious of itself and of the magnitude of its evangelistic task. The analytic method adopted here is not exclusive of the others, though different from them.

1. Christian virtue.—Under this heading we deal (1) with the objective, (2) with the subjective, dynamic of the Christian life. An objective ethical content of Christian life, a moral life, is not ethical synthesis (Plato), or discipline (Aristotle), or inhibitive control (Stoics), or culture (Goethe), or confession, or Stieler, the development of a capability given in human nature itself' (Green), but creation. All the others are needed once we get a beginning; but a beginning is impossible until Christian moralists, by a process which they may call 'directly' (Wace, Boyle Lectures, v. [ser. 1], 1874-75, cited in Luz Mundi, p. 504). The same objection applies to the Ethics of Rabbinc Judaism, where the highest good depends on works, without any real reference to the grace of God (Oesterley, 'Grace and Free will,' Expos., Nov. 1910). The objective dynamic of Christian Ethics is the Holy Spirit, or God, exerting moral creative power. The Holy Spirit is not simply the immanent Spirit of God, as that is generally viewed. Its character is revealed and its power acts through Jesus. A great novel activity of God has been manifested in the earthly life and death, and exhibited as completed in His resurrection, which makes the beginning of specific ethical Christian experience possible. Hence Christianity is a gospel of personalism, not the product of man's working or thinking, but an offer of life impinging on man for acceptance. Christian moral experience, then, takes for granted the Holy Spirit of God uniting His help to our weakness (Jo 3:3). Christian Ethics is thus primarily neither individual nor social, but theological, and that in a specific sense. Any other ethical basis is synthetically incomplete. 'Ethics must either reject themselves or integrate themselves into Hedonism' (Martineau, Study of Religion, 1889, i. 24). The Holy Spirit is viewed here not dogmatically, but as a condition of ethical power.

(a) Relation of the Holy Spirit to human freedom. Christian Ethics, like Ethics in general, postulates freedom in the sense that man is not moved simply by instinct or impulse, but can choose between presentations, alternatives, that his choice depends on himself—at least, as far as to make him responsible for it. Christian Ethics admits freedom in this sense, but it recognizes as a fact of historic experience, presupposing presupposing the nature of the man and the necessity of the gift of the Holy Spirit.

(c) This gift is a moral one, because its acceptance is based on a receptive response by the human spirit. However deadened the human ἀρίστης may be, in this region the Holy Spirit has its point of appeal. Thus the offer is to all men irrespective of class, disposition, temperament, or past history. It is just the love of God attempting to gain the human heart, and so the Spirit is not an alien power, but the very substratum of the human personality. Before this offer the Stoic distinction of the wise man and the fool, the Aristotelian cleavage between free men and slaves, vanish; the dubiety as to whether virtue can be taught at all and the bad man made good disappears. This is not simply because the moral ideal has been realized in Jesus, but because the Holy Spirit is offered to man as man.

(b) The gift is moral also, because the offer implies a task. We are to work out our own salvation with fear and trembling. Things are not ‘offered’ to us, but accepted by us, and ‘institution’ (Butler, Analogy, ch. iv. [p. 75 in Bernard's ed., London, 1900). The task set before men is now a greater one than ordinary Ethics conceives. The demands made upon human responsibility are higher than ever before. The moral life is not
first a gift and then a task, but from beginning to end these two moments are combined in one real human experience. Christian Ethics, then, does not desire to disparage man’s freedom, to overlook his natural virtues and regard them as splendida virtus et malum. Practical thinking of how man can begin the attaining of Christian perfection, and of how the race of man can start embodying in itself the Kingdom of God. It is the old question of despota, which to practically has been denied, and which Aristotle found a surd in his thinking. In this initiation men historically have failed, and a new activity of God was necessary to meet the bankruptcy of human effort. This is the gospel, which is not the destruction of freedom, but its re-creation.

(b) The Holy Spirit and conscience.—Christian Ethics also postulates conscience in the sense that man distinguishes between one action as good and another as bad, one conduct as right and another as wrong, and that the good and right ought to be done, and the bad and wrong avoided. What constitutes the need is the certainty that its laws are those of the absolutist. Hence most that its judgments are not simply critical but constitutive of conduct. It needs to be freed from its own bewildering perplexity, as freedom needs rescuing from its barbarity. That Christian Ethics, history shows, is a resultant of two moments—one the Divine purpose, the other human free actions; and, as far as the former is concerned, history is a training and a test of conscience. Conscience is thus historically made aware of its own worth (Stoicism and elsewhere), and brought to an impasse when its vision is focused on itself alone. It may act as human before it is discovered to be Divine (cf. Martinism, cp. etc. 23), but not to make this discovery. To St. Paul it was one function of the Law and of pagan experience to bring about the εὐγνωμον disposition (Ro 5:17-22, Gal 3:22). Through the love of God seen in the death of Jesus this happened. Conscience discovered its own divinity, its ‘range of sensibleness’ was infinitely extended, its perplexity abolished, its aberrations condemned. Its authority was placed in the bosom of God Himself, its fear purified in the tragic tenderness of a Redeemer crucified for sin, and its hope rekindled in the free offer of God’s saving love. Thus the enthusiasm necessary for the generating as well as for the sustaining of ethical life was given. True moral and conscience and freedom were emotionally reconciled, the one enlightened as to its true function, the other set free to carry out its real purpose. The two great questions, ‘What must I do to be saved?’ and ‘What ought I to do after I am saved?’ are now answered. The Holy Spirit does not disregard conscience, but, on the contrary, enforces it.

(c) The Holy Spirit and varieties of temperament and conditions.—Christian Ethics recognizes the infinite variety of human conditions and temperaments.

(a) There is a class which cannot accept ab initio through a personal moral act, the saving grace of God. To the demons the Lord had to apply θανάτωσι before moral relations between God and the sufferer could be established. Here we cannot theologically attribute personal responsibility in all cases, yet we are not altogether helpless. Intercessory prayer is open, and it is not without power. Perhaps the name of Jesus is of greater power and more vitalizing (cf. Nevin, referred to by Ramsay, Expos., Feb. 1912). Christian Ethics is not without hope even here.

(b) There are many, in all civilized countries even, who have bartered much of their power of response to the Divine through their own sin, or through the pressure of social evil upon them, or through both. In all such cases the Christian moralist must search for some point of receptive response and seek to remove all hindrances. The appeal of Christianity should be made unreservedly. Responsibility depends on and is proportionate to opportunities; there is a duty to present opportunity to all—to heathen, to depraved, to children—through education and training, for the Spirit of God works through means. Hence it is practical and right for the sake of the spirit, fed the hungry in order to reach their souls, and cast the seed of His word everywhere.

(1) The varieties of temperament are not accidental, but, prophetically viewed, fields of opportunity for the exercise of the manifold Spirit of God, natural bases for its varied charismata. Thus the gift of the Holy Spirit is ethically conditioned, not generally but specifically and individually. Different individuals and different nations have thus been prepared for Christianity, and their varied gifts find here their explanation (cf. Calvin, Inst. bk. iv. ch. 5); cf. Calvin, Inst. bk. iv. ch. 5. What Christianity aims at is thus not the destruction of natural endowments, but their moral potentiation. Negatively viewed, the Holy Spirit may be resisted by man through ignorance, repugnance, but by neglect, by contentment with life without it, and by searching for the highest along false lines; hence the necessity that the character of the Redeeming Spirit be made known through proclamation, through holy moral living, through the removal of stumbling-blocks in the fabric of society, and through the consecration of all natural endowments and graces. The Holy Spirit is the dynamism of the individual moral life and of social life as well. It is the condition of social progress.

(2) The subjective dynamic of the Christian life. —The subjective dynamic of the Christian life is faith in God. This admits of many stages, according to the individual concerned, ranging from the barely reflective movement (often mingled with gross superstition) of the newly heart towards the offered love of God, up to the highly conscious intensely emotional, and pressing, volitional soul-grasp of the Redeemer. Through faith, ethically viewed, the soul is converted (see art. CONVERSION), and becomes in motive (repentance), resists its re-assertion, and finds itself changed in its view of life and duty, and equipped with power to realize the Kingdom of God. It is said that such a theory is wrong because it breaks the law of ethical continuity. But continuity in the moral life is permanently secured only by the presence of the power of God in the character. The false character, fashioned without the aid of the Holy Spirit, is brittle all along the line. Continuity must not be applied to chain the soul to its evil past, but to safeguard the gains of holy living. Hence Christianity takes a view of the past which is distinctive. By the aid of God the individual can break through his evil past and, by resistance to it, ‘rise on stepping-stones’ of his dead self ‘to higher things.’ Christian faith does not energize in vacuo; it is created in Christ, and for selection of God’s love to men. Christ is the ‘hand of which we lay hold on God’ (cf. Rothe, Thes. Ethic, ii. 359).

Faith, then, brings the soul into a world of new values, and brings the individual values himself and others after a new fashion. There arises here the sense of the value of the individual. The individual is one for whom Christ died. This, personalized—‘He loved me and gave Himself for me’—is now the constraining motive of action.
ETHICS AND Morality (Christian)

The will acquiesces in this love, and finds itself reconciled to God. Peace follows which the world cannot give or take away. The individual is garrisoned with the peace of God and rejoices in the Lord. It is impossible to exaggerate the amount of pure joy and contentment that Christianity brings to a man. The enthusiasm for virtue it generates is unique. The great danger to the Christian is contentment with the old world which Christ abolished, and which, by believing, he himself has repudiated. It arises from the world of sin. It is alienation from the life of God through wicked works, the consequent darkening of the conscience and understanding, the deterioration of the will, the deadening of the spiritual affections, and the quasi-cosmos of evil in which men's subjective and social energies act, and which acts through them. It is the destruction of freedom, the darkening of the conscience, and the devaluation of the individual. The Cross shows sin to faith in its true light. It is no longer an error of judgment merely, or a lack of harmony in ourselves, or a crime against society, but a revolt against a loving God, and what is most revolting is that it is all this. Sin is thus not in the actions but in the will, and sins are graded according to this inwardness of view. The Pharisees—the proud, haughty, learned—are more hopeless than the miserable, restless in their sins.

Faith thus calls upon itself to a battle at.outances with sin, and here begins the problem of the formation of character. Christian character-building is just the soul of man being habituated to the active presence of God, and transforming the natural endowments into spiritual instruments to carry out the will of God (sanctification).

Patience is the quality of mind which arises by itself from the sense of God's love: great love in Christ to us. It is due not simply to a sense of our finiteness and of God's infinity, but much more to a sense of God's activity in saving love so utterly undeserved by us. Intellectually, it is adoration, as we see God's infinite patience with men in history and His provision for their salvation (cf. Ro 11:30-32). It is the outlook of the soul on its own sinful past, and the recognition of God's forgiveness of it. It is the remembrance also of our present frailty and future difficulties, and the knowledge that we need God every hour. Towards men, humility arises as we become conscious of our indebtedness to others— to God and Jew alike. God's varied gifts are meant for common blessing and common service; hence humility condescends to men of low estate. It is the death of pride and vainglory. It expels the difference to the common needs of men. It is the disposition which makes advance in knowledge possible, makes self-sacrifice in action easy, and keeps open the windows of the soul in adoration towards heaven. It also consecrates the most service because it is done for God (cf. the widow's mite), and fills the humblest life with sweetness and dignity. One can hardly call it a virtue; it is rather the aroma of a life lived in the sense of God's amazing love (so free and undeserved) to men in Christ. Closely associated with it are the gentle graces of character—regard for the needs of others, sympathy with suffering, respect for the lowly, an eye for the glory of the commonplace, compassion, tenderness, pity, gentleness, obedience, lack of ostentation, thankfulness, a forgiving spirit. What becomes the decision of itself and tries to ape itself, it loses its peculiar flavour, and thus the monastic conception of humility (doing menial tasks, etc.) tended towards the destruction of this spontaneous Christian grace.

The theme of the chapter is seen in the fact that in it is also the germ of the many virtues— independence, courage, endurance. Because faith is sure of God's forgiveness, the character is strengthened into fidelity to God against all odds. Thus is generated an independence based on God, far surpassing anything found on the heights of Stoic arete, and a courage which is not an ebullition of natural courage, but a habitual mood of the soul. Faith lifts man above the tyranny of the customary and the accidents of fortune, for it is loyalty to Christ. This loyalty finds sufficient exercise in our ordinary callings: Luther was true to the Christian spirit when he rescued common vocations from the stigma of inferiority implied in the meritorious life of the cloister. The patient endurance (bravery) of pain and suffering and of the flux of earthly blessings, whether that be directly due to providence or to the hostile opposition of society, is a result of faith. Hence follows contentment. It is neither the daphnia of Epicurus nor the arete of Stoicism. It does not shun difficulties, but it does not create them unnecessarily (Ro 12:2); it feels pain and injustice keenly, and, where possible, removes them. Patience is the knowledge of what is to be endured with a good conscience, and what is to be cast away. It is thus gentle and stern, passive and active (Rev 2). Patience must never fail, and hence suicide is never allowable. Patience may lead to death, but if a holy, the gateway to the resurrection.

As the Christian has to live his life in his vocation, he is impelled to exercise discretion in trying to find out God's will. He is a member of society with definite calls on him, involving the welfare of others and the progress of Christ's Kingdom. Hence knowledge is a virtue. Such a knowledge is determined by the interests of the new life. It is practical, and must avoid foolish questionings. It is for that very purpose which he is to men, and must not puff up, or separate the possessor of it from his brethren and the pathway of ordinary duties. It need not be perfect in this world, but is a growing intensity of penetration into the active purpose of God.

Faith is thus the personal bond which unites the human person to the Divine redemptive Spirit and submits itself to the dictation of that Spirit. The Christian view of virtue is different from that of the Stoics. "We may only speak of Christian "virtue" if we keep constantly before us what has been said of the reception of faith by the bountiful grace of Christ, and the Christian moralist should not forget, however dried up, the moral life could not longer be maintained. Christ is not and remains the principle, rather the primary originator, of holiness, as He is the principle and conversion will of the Christian life" (Häring, Ethics of the Christian Life, p. 347).

Hence the end of Christian virtue is to be a perfect man in Christ, to live with a sure hold of the world of values which Christ revealed, and to convert these values into reality. Its great means of subsistence and progress is prayer. Prayer is faith seeking and finding power from God, thankfully acknowledging its privilege, becoming conscious of its task, renewing itself to follow the path of Spirit of God indicates. The Church as means of grace is valuable as it helps this, for it is a house of prayer, and all other so-called means of grace should ever be used in holding Christ up before the soul as the Power and the Pattern of Holiness. Prayer is not simply negative and protective, but positive and constructive. It is the Spirit of God re-creating man in God's image, and the work of man's spirit working out his own salvation.

* The Spirit is not merely, in St. Paul's view, an aggressive force leading the human spirit against the flesh, or a defensive power shielding it from attack. Stoicism, as interpreted by Seneca and Epicurus, was able to go some way in that direction. St. Paul opens another door of hope; his indwelling Spirit is also a constructive power which builds up a new life within, co-operating with the spirit of man in the work of restoring human life to the image of God" (Swete, Holy Spirit in New Test., 1900, p. 344.).
Faith issues in hope, according as it experiences the power of Christ in the pressure of temptation and affliction. Hope rests itself on Christ's victory and the hope of this victory is also the hope of being saved. It is cognizant of the might of sin and its energy, it knows the tribulation that accompanies righteousness, but it has counted the cost and tasted the bitter herb of the new life. If Christ has never failed to save, hence the continual optimism of the Christian character, touched with a seriousness and gravity unknown elsewhere. Hope can 'reach a hand through time to grasp the far-off interest of tears' (Tennyson, cantou 1). It is, like prayer, focused in Christ. Christ is the atmosphere of its life and the limit of its longings. It thus faces life with a spontaneity of assurance which sin in all its potent resistance can neither demoralize nor overcome.

Because faith and hope are orientated in Christ, they energize in love, and all the virtues and graces are thus determined as to their inner quality. For Christ, too, good for the unrighteous, will become self-centred. Hence the need of love, lest the emotions should rest in themselves. Thus the 'gift of tongues' has to be used for the benefit of all. The man in the midst of its social task, and the great deeds of self-denial must not become monuments of selfish display (1 Co 13). Christ is the perfect embodiment of love, and the aim of the Christian man is to know the love of Christ which passes knowledge (Eph 3), and to give himself no rest till all men are made participants of the same love (2 Co 5). Prayer then becomes intercessory and social, for it knows that common blessings issue from common prayer; and the Christian man, in all his inner and outer activities, feels the worthlessness of all if love be lacking. Christian perfection consists in the possession of such a love as is seen in Christ. This is eternal life.

2. The Christian ideal.—The Christian ideal is, individually viewed, eternal life, and for all men, organically viewed, the Kingdom of God. These two are inseparable and interchangeable, yet are distinguishable as the individual and the common good. What is the content of this good? Christianity makes no attempt to give an exact definition, but seeks to communicate it and let it reveal its nature by its presence and possession.

(a) Eternal life is not existence infinitely prolonged. Dives may live after death, but his existence may be a curse. Yet, clearly, eternal life is a perfected good, however short its existence, 'admits of no answer but produces no conviction' (Hume's Works, ed. London, 1854, iv, 176). The tremendous reality of death must be faced by all earnest, ethical thinking. Heartless banter, Stoical indifference, perplexed uncertainty towards it, cannot satisfy serious men, and any ethical ideal limited by death stands self-condemned. Thus Plato thought extension of life to immortality in heaven, as argued by Aristotle in the Prolegomena (1899, p. 105). The worth of eternal life is not, however, its duration in itself; its duration is implied in its worth. Immortality, as bare existence after death, may be as Sheol or the realm of Hades—both so hazy that one day of labour on earth is preferable to them (cf. Od. xi. 489 ff.).

(b) Eternal life does not mean living in a beautiful body or pleasant surroundings, otherwise many would in limine be cut off from its possibility. Aristotle could hardly conceive it possible for dead men, persons, or slaves, or even artists to possess the sumnum bonum. The Christian ideal is open to all. We must not forget this truth in our ardour for economic improvement and our advocacy of a living wage. The man clothed in purple and fine linen and fanning sumptuously every day may be unaware of what eternal life is, while he who has not it is glaringly bad. Even though 'friends, leisure, and means' were for ever possessed, the Christian life might still be lacking. Thus the Christian ideal conflicts with all ideals sufficiently realized to give it spiritual and temporal satisfaction, and interests with no outlook beyond (cf. Browning's Old Pictures in Florence for the difference between Greek and Christian art in this respect).

(c) Eternal life is communion with God. Man was created in God's image, re-created in the image of the Son. Hence man's aim is moral likeness to God. The great task of Christian teaching is to awaken in man the practically lost sense of sonship; for, when the prodigal returns to his Father, then he who was dead is alive again. This communion is not the absorption of mystic contemplation or Nirvana. Such an absorption negates moral values and reverts to the merely religious, i.e. simply the communion of the 'γνωριμία' in man with the eternal reason, as Plato tends to make it in the case of Socrates (Phaedo). That would leave the individual whole, but without a character in its sublimation. By communion, Christianity does not mean breaking the limits between the Infinite and the finite. These are not moral distinctions at all. They are not barriers to communion. What is aimed at is freedom from sin, and the acquisition of holiness. This communion is a moral life, and it aims at perfection through moral activity. It is, ideally viewed, a real eternal personal communion, in which all endowments and characteristics are morally potentiated to their highest degree. It is a personal life of righteousness saturated in the atmosphere of a Personal Holy Presence. The Christian ideal is at the same time the Highest Good. Viewed as Ideal, it waits its full realization; as the Highest Good, it is a present possession. Thus, while it awaits its full realization, it must be morally operative now. It is other worldly, but it demands all reality as its content.

(d) Eternal life is a fellowship dependent on the possession of a righteous character, and it is maintained in the living of a righteous life. 'Be ye holy, for I am holy.' The way to attain it is not, as Orphism taught, to escape from matter per se, through acts having little moral reference in themselves and valuable only as means. The moral life is not a means towards the good life, but simply, but a permanent moment of the Christian ideal. This aspect of communion and the way to attain it break down the false asceticism and subjectivism that dog Mysticism. For eternal life is a righteousness that demands all for the service of God.

(i) Eternal life demands Nature. Jonathan Edwards declares that he saw a new beauty in Nature at his conversion; so Lactantius and many besides. In the light of the ideal, this world is God's world and a theophany, as it was to ancient Phainists. To make this universal through the aesthetic side of life—through art—to make the lily and the bird bring us to our Heavenly Father. True art should thus be a means of righteousness, and so should true science. Neither material needs, nor pains, nor privations, should obstruct this communion; nor should the pressure on oneself, the attention solely on themselves. Their pressure should lead us beyond themselves. Nor should the soul attempt to satisfy itself in worldly possessions, to the exclusion of God. That is why Jesus warns against anxiety and riches, because the affairs of business and pleasure, exclusively pursued, turn the will into channels divergent from
the will of God; because ideals through these influences are truncated, and the singleness of sin which ought to characterize conscience becomes blinded by the false lights of the world. Experience in this, as in every other sense, shows that there are no more certain ways of falling out of fellowship with God than these. To act thus towards Nature is to be ruled by it—not to rule it, as is the Christian ideal. Christ's Lordship over Nature is a principle of life, and thus true in Rother's view that morality is the gradual spiritualization of Nature. Every advance in science, every subjugation of natural forces, every great work of art, should make righteous communion more easy. When these advances are absorbed into the service of injustice, then communion is more difficult. One of the great tasks of Christianity is to convert the material gifts of civilization into means of righteousness, and not suffer them to be held in the bondage of non-moral or immoral purposes.

(ii.) Eternal life demands the whole of mankind and of every man. Just as Nature becomes a theophany in the life of the ideal, the bodily members become ἐνεργὸς τοῦ θεοῦ. Even in the future perfect communion, Christianity does not offer the abolition of the body.

The Christian is not one for liberation but for liberation was the hope which it held forth to the world. Human nature is to be perfected, not by the abandonment of one of its factors, but by the sanctification of the whole man. Humanity is to be preserved in its entirety for the coming Christ (Swete, 236).

Thus righteousness includes care for the bodies of men and for their proper surroundings. Sickness is due to sin, and our Lord's ministry of healing is an integral part of the Kingdom. Hence Seeley (Eccle Home, ch. x.) rightly points out that, on the one hand, Christian care for the body passively, while, showing, at the same time, a more than Stoic apathy in regard to personal suffering. The passion for social reform, the crusades against disease and degeneration, the desire to regulate labour hours and conditions that would breed weaklings and fill our hospitals, ought to find in Christianity their warmest recruits. Every sinner is a dead weight on the Christian heart, making communion with God more difficult. The same applies to nations sunk in superstition and paganism. Righteousness, rightly understood, is the nerve of missionary effort. Till the whole of humanity is more and more tenderly, more deeply, in the Kingdom of God, there is something lacking in the fullness of the ideal.

(iii.) Eternal life demands an interpretation of history. Righteousness is the history. It is the highest good in history; but, because it has not been fully entrenched in any society or any institution, it is an ideal to be realized, though present from the first, and all along moving towards realization. The truth of history is the Kingdom of God. This culminates in Christ, and unfolds itself under His control. We are thus given a standard to evaluate individual, societies, and movements; it helps us to tell in concretely the ideal itself and give guidance for the future.

The inner nature of eternal life, of the Kingdom of God, is thus seen to be love, because it culminates in Christ. Love is not a baseless psychological experience that can be made or forgotten by individuals. It is the Reality. God is Love. Love is the inward spirit of righteousness in man, and man in Nature. Men may appreciate order in Nature, purpose in history, and righteousness in conduct before realizing the inner nature of all as Holy Love. This is Dorr's justification for regarding righteousness and love, but the contrast is one of human appreciation, not of inward nature (see R. Law, The Texts of Life, 1999, p. 80). To have the love of God shed abroad in our hearts, to see it preparing a world for itself and realizing itself in human relationships, is to have eternal life and to be in the Kingdom. Love tries to reproduce in men a character in which it is perfectly realized that there are no more certain ways of falling out of fellowship with God than these. To act thus towards Nature is to be ruled by it—not to rule it, as is the Christian ideal. Christ's Lordship over Nature is a principle of life, and thus true in Rother's view that morality is the gradual spiritualization of Nature. Every advance in science, every subjugation of natural forces, every great work of art, should make righteous communion more easy. When these advances are absorbed into the service of injustice, then communion is more difficult. One of the great tasks of Christianity is to convert the material gifts of civilization into means of righteousness, and not suffer them to be held in the bondage of non-moral or immoral purposes.

(iii.) Eternal life demands an interpretation of history. Righteousness is the history. It is the highest good in history; but, because it has not been fully entrenched in any society or any institution, it is an ideal to be realized, though present from the first, and all along moving towards realization. The truth of history is the Kingdom of God. This culminates in Christ, and unfolds itself under His control. We are thus given a standard to evaluate individual, societies, and movements; it helps us to tell in concretely the ideal itself and give guidance for the future.

(e) The inner nature of eternal life, of the Kingdom of God, is thus seen to be love, because it culminates in Christ. Love is not a baseless psychological experience that can be made or forgotten by individuals. It is the Reality. God is Love. Love is the inward spirit of righteousness in man, and man in Nature. Men may appreciate order in Nature, purpose in history, and righteousness in conduct before realizing the inner nature of all as Holy Love. This is Dorr's justification for regarding righteousness and love, but the contrast is one of human appreciation, not of inward nature (see R. Law, The Texts of Life, 1999, p. 80). To have the love of God shed abroad in our hearts, to see it preparing a world for itself and realizing itself in human relationships, is to have eternal life and to be in the Kingdom. Love tries to reproduce in men a character in which it is perfectly realized that there are no more certain ways of falling out of fellowship with God than these. To act thus towards Nature is to be ruled by it—not to rule it, as is the Christian ideal. Christ's Lordship over Nature is a principle of life, and thus true in Rother's view that morality is the gradual spiritualization of Nature. Every advance in science, every subjugation of natural forces, every great work of art, should make righteous communion more easy. When these advances are absorbed into the service of injustice, then communion is more difficult. One of the great tasks of Christianity is to convert the material gifts of civilization into means of righteousness, and not suffer them to be held in the bondage of non-moral or immoral purposes.

(iii.) Eternal life demands an interpretation of history. Righteousness is the history. It is the highest good in history; but, because it has not been fully entrenched in any society or any institution, it is an ideal to be realized, though present from the first, and all along moving towards realization. The truth of history is the Kingdom of God. This culminates in Christ, and unfolds itself under His control. We are thus given a standard to evaluate individual, societies, and movements; it helps us to tell in concretely the ideal itself and give guidance for the future.

(e) The inner nature of eternal life, of the Kingdom of God, is thus seen to be love, because it culminates in Christ. Love is not a baseless psychological experience that can be made or forgotten by individuals. It is the Reality. God is Love. Love is the inward spirit of righteousness in man, and man in Nature. Men may appreciate order in Nature, purpose in history, and righteousness in conduct before realizing the inner nature of all as Holy Love. This is Dorr's justification for regarding righteousness and love, but the contrast is one of human appreciation, not of inward nature (see R. Law, The Texts of Life, 1999, p. 80). To have the love of God shed abroad in our hearts, to see it preparing a world for itself and realizing itself in human relationships, is to have eternal life and to be in the Kingdom. Love tries to reproduce in men a character in which it is perfectly realized that there are no more certain ways of falling out of fellowship with God than these. To act thus towards Nature is to be ruled by it—not to rule it, as is the Christian ideal. Christ's Lordship over Nature is a principle of life, and thus true in Rother's view that morality is the gradual spiritualization of Nature. Every advance in science, every subjugation of natural forces, every great work of art, should make righteous communion more easy. When these advances are absorbed into the service of injustice, then communion is more difficult. One of the great tasks of Christianity is to convert the material gifts of civilization into means of righteousness, and not suffer them to be held in the bondage of non-moral or immoral purposes.
organized institution. For this reason the Early Church recognized duties of benevolence, of hospitality, of finding work for her members. It may be said she was less necessarily a labouring institution than various other, though self-sacrificing, institutions. These, of course, are duties for some individual Christians only but they are corporate duties as well. Above all, she should aim at removing stumbling-blocks from the way of righteousness, but her weapons are love, not physical force. This incompatibility with the Kingdom of God is the common good. Christian Ethics should insist on the duty of the Christian State in administration and legislation in order to remove the danger of forced sacrifice and exploitation, for the State has become the supreme power, the instrument of the will of God as the common good. Christian Ethics should insist on the duty of the Christian State in administration and legislation to look after the welfare of all classes, and to make all contributions to this end, to the common good. The means of education and an honest livelihood should be within the reach of all; hence poverty and its causes should be abolished as far as possible. The weak should be protected against aggression and exploitation, as also against themselves. The Christian conscience is certainly coming to make greater claims on the Christian State in the way of providing work for all, in demanding a living wage, in looking after the aged and the helpless young; and the science of Economics is rapidly providing a basis for scientific legislation. These demands carry with them the corollary that the State has greater control over private interests than was once recognized, whether the interests be those of capital or labour, money or work, land or commerce. What we need, however, both in the State and in the various minor institutions that compose it, whether public or private, is the spirit of devotion to the common good by all, and the spirit of self-sacrifice among those who have special spiritual and material endowments. We need the Christianizing of the public conscience which determines the State to be a Christian State which is no recognized mouthpiece to give voice to the duties of State to State. ‘Si vis pacem, para bellum’ has converted Europe into arsenals. But war is incompatible with Christianity and its incompatibility with State duty should be more and more recognized.

We have not, owing to the limits of this article, entered into details. Suffice it to say that the Christian ideal of the Kingdom of God, which is also the Supreme Good, lays on all who accept it duties of brotherhood, service, and self-sacrifice; that, as far as natural institutions are Christianized, the same is true of the Church, so that the hope of Christianity should make us fall back more and more on the Eternal Spirit who originates, sustains, and shall perfect, through human endeavour, the Kingdom of God.

ETHICS AND MORALITY (Egyptian)

1. Introductory. The opinion of the Greeks, that the Egyptians were a profoundly philosophical and religious people, has been shown by them as the contemporary inscriptions and monuments to be false. The belief of the Egyptians was essentially practical; and, if they attained some proficiency in mathematics, astronomy, and medicine, it was for the sake of their own ends; the sciences could be put to no practical use. For the things of the mind, as such, they had little taste; hence their ethical views were without depth, and they had no opposing schools of ethical thought. Nevertheless, it cannot be denied that the Egyptians took a very keen interest in the moral aspect of the world. They were never tired of boasting of their virtues, and the popularity of the Osiran worship bears witness to their strong moralising tendency. To put the matter shortly, the Egyptians, though not ethically speculative, were in a high degree ethically minded.

2. Terminology. Language usually provides a root, from which all the possible scholars have been shown, with regard to any given topic, since thought tends to create its own adequate expression. The Egyptian expressions for moral concepts are neither numerous nor precise. For 'right' the word is sret (Copt. μέτ' ); also mib; the older Egyptians write wdt, ma, etc., which seems to be derived from a verb meaning 'to be straight,' 'to move in a direction.' Thus mret signifies conformity to an ethical norm, \(^1\) though it has also, and perhaps even more frequently, a purely intellectual connotation; it then means 'truth.' The contradistinctions of maret are 'sufs, wrong,' and 'ezes, guilt,' 'gory more often found. For 'good' and 'bad,' mib and bmb mend the commonest terms; they also stand for 'beautiful' and 'ugly' respectively. Pote means 'crime;' for 'sin' is used the plural. For 'what God wants,' 'what God disapproves.' There is no verb corresponding to 'ought;' 'duty' is represented by 'ere, that which is reckoned as against a man, his debt to the community.\(^2\) The will, as a moral entity, is unknown, and is not distinguished from the agent ('I, me').\(^3\)

\(^1\) Very often the best rendering is 'right' but 'just.'
\(^2\) The word 'ere is derived from the preposition er, 'towards,' 'against;' cf. NCTEPON, 'our debts,' in the Coptic versions of the OT. The Old Testament is frequently 'against us.'
\(^3\) The elusive word ka, which is usually translated 'double,'

The word 'tāb (= Heb. 25), 'heart,' is often found in Egyptian texts for the intellect or reason; but it appears sometimes to mean more than the mere instrument of cognition; it means the faculty which recognizes and suits the right course of action, 'the conscience.'\(^4\) In the following passage, which is a good example of Egyptian modes of expression in ethical matters:"

Thus saith he: This is my character to which I have borne witness, and there is no exoneration which he could make, if it were not for my heart (tāb) that caused me to do it through its guidance unto me. It was an act opposed to the will of my commands; I feared to transgress its guidance. Therefore I prospered exceedingly, and was fortunate on account of that which it caused me to do; hence the reason of its guidance. Of a sooth, true is that which is said by men: "It (namely the heart) is the voice of God that is in everybody; happy is he whom it has led to a good course of action!" (R. Seth, Urkunden des Ägypten, Leipzig, 1889 [hereafter cited as Örb.], iv. 973; cf. iv. 139, and W. Wessmann, Wiener Forschungen, Leipzig, 1896, p. 160).

The 'thoughts' of men are 'that which is in the body (tām-ēb) or 'the concerns of the heart' (hert-ēb). The very concrete way in which psychological facts were expressed is here conspicuous; for more complex ethical concepts, such as 'motive,' 'responsibility,' 'scruple,' abstract names were wanting.

The moral predicates were represented in language in an equally concrete way, an adjective or participle, metaphorically used, being combined with such substantives as 'tāb,' 'heart,' and 'hert-ēb.'

3. Destiny and free will. The Egyptians were strong believers in Fate (shay), which was occasionally condemned; as a rule, however, it was 'God' ('nēser) in general, or some god in particular (e.g., Rē [Urkh. iv. 943]), who is supposed to determine the events of a man's career. The uncertainty of the Egyptian project is thus expressed: "What men have devised never comes to pass, it is what God commands that comes to pass.' For instance, 'One man plans to plunder another, but the ends by giving it up, in the name of God.' (Papyrus Prisse, 6, 9-10). On this account the precept is given: 'Take no counsel for to-morrow ere it come' (Patria Ostraca, 11; Prisse, 6, 8).

Luckily the Egyptians did not, as a general rule, go on to conclude that their own actions were unchangeably predestined; the influence of Fate seems to have been restricted to the things that might happen to men, and did not extend to their actions (cf. FATE [Egyptian]). We have seen that 'conscience' was compared to the 'voice of God' speaking in the heart, but there was no compulsion to listen to the voice.

It is quite an exceptional case when Simuhe in the tale excuses himself for his flight to foreign parts by attributing it to the will of the god (Sin. B, 43), 'who decreed this flight' (6. 150). And, when the magician discloses responsibility for the formula he pronounces: 'It is not I who repeats; it is Horus who says it, and he who repeats it;' (Papyrus Porta, 136, 3), this is a statement governed by quite special conditions.

That men are free agents is a necessary assumption in everyday life; that the opposite is true has often appealed to men as a moralizing principle, but it may sometimes conveniently be rendered 'will;' so, too, hau, lit. 'soul.'
The theological expression of this idea was as follows: *The fear of God* (ib. 64) might also be a powerful inducement to the man of good conduct, inasmuch as *God knoweth that which is in the body... his eyes perceive men's characters in their livres* (Newberry, 8. 80).

Of course the Egyptians were well aware that often it is the rich and not the good who prosper, and a passage in a literary satire illustrates the fact that rank and comfort were sometimes obtained without any superabundant merit (Anast. i. 8. 4-6). That all men are sinners is assumed as axiomatic in a passage of the Book of the Dead (ed. Naville, Berlin, 1886, pp. 17, 44). The wickedness of the world and the predominance of vice over virtue form the theme of a whole class of pessimistic writings, of which several specimens have survived. Here social conditions are depicted as topsy-turvy—the slaves have usurped the place of the rich, murder and rapine prevail, the righteous dwell alone and in misery. From this state of affairs one author draws the conclusion that life is not worth living (A. Erman, Das Gespräch eines Lebensmünden mit seiner Seele, Berlin, 1896); another gives as the cause the impotency of mankind and the callowness which completely spoils its elevated lot—*Never has wickedness brought her vanguard to a peace* (Pap. Brit. Mus. 15110, S. 5, 7, 9-Fries, 2).

5. The question of disinterestedness. Egyptian moralists may now and again have caught a glimpse of the loftiest heights of ethical thought—the conception of right as its own sufficient reason, regardless of consequences; but in general their teaching was on a lower plane. *Excellence is the mark of Pharaoh* (Pap. Brit. Mus. 15110, 5-9, 7-Fries, 2), *and endareth and prevaileth*; upon this irreproachable sentiment there was, however, imposed the limitation which completely spoils its elevated lot—*Never has wickedness brought her vanguard to a peace* (Pap. Brit. Mus. 15110, S. 5, 7, 9-Fries, 2).

The Egyptians were very sensitive about their reputation, and often boasted of having won the approval of their fellow-creatures. *I did what all men approved,* says one noble (Urk. i. 70): a hackneyed phase of the funerary stele is, *I did what men loved and what pleased them* (ib. 71), an ancient proverb that *the good deeds of a man are his monument, an evil nature is oblivion* (PSBA xvii. 1889-90).100. In the general doctrine of a good reputation as a necessary limit of Egyptian disinterestedness is reached; it was deemed the highest possible virtue for a man to *raise up a good name* in his city (Shipwrecked Sailor, 150), though, of course, the desire for approval is a self-seeking motive only a little less base than other selfish motives. Naturally it was more profitable to a man that he should stand well with the king than that he should be respected by the good men of the city; the Egyptian noble, in the *naisvet of his soul, esteemed himself even more for the good opinion in which Pharaoh held him than for his fair fame among his equals. Bleded with protestations of his generosity, his love of justice, and his incorruptibility, he was frequently in describing himself as 'beloved of his master,' or as one 'with whose excellence the lord of the two lands was content.' In such a high degree was the Pharaoh considered to be the patron and recompenser of virtue that he was known as *the good God,* and *the lord of Right.*

Thus an official relates, *I did right for the lord of Right, for I knew he was pleased at it* (Urk. iv. 94). To Esauessu it, it is said: *Thy tongue is the shrine of Right* (Kuban Stele 18).

Yet, in spite of the absolute form of the government under the Pharaohs, the popular verdict was held of high account. The speech of Thutmose III. in appointing his Minister of Justice illustrates this point in rather a remarkable way; among other things it is said:

*For evermore, there is some injustice in him in the opinion of men; and again, 'As for the chief scribe of the Voice, Scribe of Righteousness is what he is called' (Newberry, Life of Rameses, London, 1899, p. 110).* 5. Virtue rewarded on earth: Egyptian pessimism. —It was very generally believed that virtue alone can ensure happiness on earth. A man who has favoured us with a long catalogue of his virtues ends with an address to mankind:

I speak to you, O mortals; listen and do the good deeds that I have taught you to do. *Then you shall dwell in peace* (Urk. iv. 61, cf. 65). To a king it is said: *Do the right that thou mayest live long in the land* (AvA xiv. 1870) 105.

ETHICS AND MORALITY (Egyptian)

such risks the dead man had but one weapon, namely, the curse. An oft-repeated formula, current in the Old Kingdom, threatens the violator of tombs with 'judgment through the great God in the place where judgment is given' (e.g. UeK. l. 17), and is known as the 'two roads of the great God, lord of judgment' (A. Mariette, Les Mastabat de l'ancien empire, Paris, 1881-84, D 19). These phrases give us the conception of a Divine being who to some extent in the character of dispenser of retribution to the wicked enemy. Whether Osiris is here already meant is perhaps open to some slight doubt; but the Osiran cult was now rapidly gaining ground, and it was not long before a certain episode in his history acquired a wide-spread funerary application.

It was narrated that Osiris himself had been accused by his wicked brother Seth before the Divine conclave in Heliopeis, but by the aid of Thoth had issued 'justified' from the ordeal (Ermak, 41, 116). Soon every Egyptian found pleasure in identifying himself with Osiris, and in regarding himself as destined to share the fortunes of the god, and at last after death and judgment to attain to the enjoyment of eternity. Hence we see the epithet mu'khrow, 'justified, appended to the names of all deceased men from the early middle Kingdom onwards (Maspero, Etudes de mythologie, Paris, 1897). It is a word of very wide application.

Chapter 125 of the Book of the Dead—In the doctrine of the psychostasis the identity of the judged man with Osiris is nearly, though not quite, lost to sight; Osiris here is the Divine judge, the king of the dead, and the 'prince of eternity.' The famous chapter of the Book of the Dead known to Egyptologists as ch. 125 comprises a picture of the scene of judgment (see preceding page), and a long text giving the words supposed to be spoken on the occasion.

In a great hall, the roof of which is crowned with flames of fire alternating with the symbol of light, the Osiris enters under a canopy. He is accompanied by his sisters Isis and Nepthys, and the sons of Horus are also present. At the back of the hall are seated the dead assessors of Osiris, forty-two in number, corresponding, as some have supposed, to the forty-two names or provinces of Egypt. In the foreground is the great balance, with the heart of the deceased in one of its pans and the feather of Ma't (light) in the other. The dog-headed Anubis examines the tongue of the balance, and the ibis Thoth, the 'scribe of the gods,' announces the result to Osiris. Hard by there squats a sinister-looking animal, 'a crocodile in its forepaws,' and the 'faunt of the dead' (that is, the devil) is the 'devourer of the dead' who fail to support the test. Neither the picture just described nor the text has come down to us in copies earlier than the middle of the XVIIIth dynasty. That the text at least is far older is proved by the corruptions it contains, as well as by the very obvious nature of its compositional origin. The kernel consists of two Negative Confessions, or Repudiations of Sins, as they would be better called. The older of these (A) contains simple denials of a number of specific sins. The later version (B) has derived a few of its details directly from A, but shows a marked preference for denials of evil qualities rather than for denials of evil deeds; it also increases the number of sins repudiated to 42, on the model of the forty-two assayers of Osiris being invoked in each case. The two Confessions are, of course, at one time independent; in ch. 125 they have been welded together, and are accompanied by prayers to Osiris and to his assessors. The variant form of B is most common.

It was doubted on this occasion that Osiris received the 'wreath of righteousness' (nuk mu'khrow) often named in Egyptian texts as one of the many Graeco-Roman tometermines, and also the 'crown of righteousness (yer-deru saheru) of the NT (see Comrie-Gardiner, E.H.K. t. 210, 214).

The posthumous pilgrimage to Abyssis (see below, § 10) is also connected with Osiris as judge. Osiris has had as its object the 'fetching of justification' (mu'khrow). The vignettes vary considerably: the above description does not apply to any one particular example.
argued that these were not specially emphasized at the time when the lists were drawn up; and the proposed oracles, petty omen, and denials against religion is urged as a proof that they were considered as heinous as calumny or murder. Far worse than such deductions is the comparison of the two versions in order to distinguish an earlier from a later condition of ethical thought. All such arguments are based on the unproved and wholly unwarranted assumption that the 'Negative Confession' is, as it were, a canonical repudiation of the ideas that were held heinous. The very existence of two lists differing in their details is in itself an indication that neither possessed any high degree of authority; moreover, both exhibit all the signs of careless and hasty compilation. We may be sure, too, that, if great weight had been attached to the precise text, more trouble would have been taken to preserve it from corruption. The truth is that the nature of the sins denied was not the central point of interest to the author or authors of the chapter. Their aim, so far from being an ethical one, was essentially, though perhaps not quite consciously, anti-ethical. Accepted, or despised, in this world, happiness in the hereafter is conditioned by a previous life of innocence upon earth, they proceeded to elaborate an incantation such as might hoodwink the Divine Judge and enable him to evade the natural consequences of his sins. Chapter 125 of the Book of the Dead claims to impart knowledge of the words to be spoken on entering the Hall of Righteousness; the tacit assumption is that a knowledge of the names of the judge and his assessors and of what sins to deny was as serviceable a means of attaining eternal felicity as the cleanest of conscience. Whether the sins repudiated had actually been committed or not was a matter of comparative indifference; the main point was that the deceased should be ready with his denials. Nor was it necessary for him actually to commit the chapter to memory; he in whose tomb it was inscribed, or with whom a papyrus containing it was buried, might feel himself perfectly safe as regards the judgment to come. Chapter 125 is, in fact, just such another magical document as that Ledyen papyrus (no. 304), containing spells for aiding a man who had been taken before a court of justice 'to issue thence justified' (ma'Kharon). To sum up; it has been seen how a non-ethical theory of the future life, whereby it was contingent on the performance of certain rites and the recitation of certain formulae, gave rise to a theory in which ethics was of paramount importance; and it has been seen how ch. 125 of the Book of the Dead, while acknowledging the truth of the latter view in principle, finds a means of subordinating it to the earlier view in practice.

10. The story of Osiris.—In the doctrine of the *psychostasis*, Osiris appears as the perfect judge, the arbiter of human character and ruler of the virtuous dead. The origin and the early nature of Osiris are shrouded in obscurity, but at a very ancient date he became the prototype of the beneficent Pharaoh. Mythology told how Osiris had succumbed, after a long and prosperous reign, to the perfidy and treachery of his wicked brother Seth, who mutilated his body and scattered his limbs. At length Isis, the faithful wife of Osiris, succeeded in collecting his remains, and infusing new life into them by dint of her magical power; but

1 It will be noted that the passages quoted throughout this article are of very various dates. The reason is that it is seldom possible to trace any development of Egyptian ethical ideas, and a knowledge of the history of his life is therefore required. It is likewise impossible, with the evidence at our disposal, to distinguish between the different moralities of different grades of Egyptian society.

5. Henceforth Osiris was a shadowy being ruling among the dead, while his son Horus, having taken vengeance and avenging the death of his father, became the god of the living. It is, doubtless, owing to its human interest and pathos that the story of Osiris took so firm a hold on the imagination of the Egyptians; and, as we have seen, every Egyptian who died claimed to be another Osiris, destined at last to conquer the powers of evil, and to awake to a happier and never-ending life. Pilgrims flocked to Abydos, which had become (though not much after the defeat of Seth) the chief sanctuary of the god; and, as every one sought to establish for himself a cenotaph in that city, it was sometimes called 'the island of the Just' (Gardiner, Literary Texts, Leipzig, 1917, 1, 7, note 1). In the temple-cults all the other gods were gradually assimilated to Osiris; and the Pharaoh, whom a fiction always represented as the chief officiant, played the part of the 'loving son' Horus (A. Moret, Le Rite du culte dîtin jurassier, Paris, 1901). In Ptolemaic times, Osiris was blended with a newly introduced god, Serapis, and henceforth his importance waned; but at the same time the idea of the hope of happiness in the hereafter was in his shrines the Osirian faith was kept alive throughout the length and breadth of the Roman Empire.

11. The gods as guardians of morality.—As the personification of all that is good, Osiris acquired the title of *Onnopfre* (Onnophris), 'the good being,' besides which he was known as 'the great God, the lord of Right.' Seth came to be regarded as the essence of evil; and, though his cult persisted in certain places where the secondary antithesis to Osiris had not been able to dislodge the primitive cult, his image was generally held in abhorrence, and at certain periods was obliterated from the monuments. The gods of the Egyptians were collectively regarded as good, though individually they might be bad or neutral: thus, in narrating his virtues, a noble says, 'I did what all the gods loved' (ZA xlv. [1908] 125). We have seen above that 'God'—the vague entity which not seldom takes the place of more explicitly named divinities in Egyptian texts—was looked upon as the dispenser of reward and punishment. This conception was, doubtless, a generalization due to the importance of the local gods. Every Egyptian felt himself specially dependent upon and bounden towards the god of his city or of his local deity, whatever his individual name or characteristics, was at bottom nothing but the personified feeling of the community, and, hence, as a matter of course, also the guardian of the ethical code. Besides Osiris there were other specific deities, who were thought of as judges or patrons of virtue. Amen-Rê is called the 'Vizier of the poor, who taketh not the bribes of the guilty' (*Pap. Bologna*, 1049, 2, 4). Thoth, the scribe of the gods, is also the 'Vizier in heaven,' and Ptah is the 'lord of Right or Truth.' On-hor (Onmris) also was frequently appealed to as arbitrator (Gardiner, Literary Texts, 1, 6, note 4). That the gods were regarded as righteous judges is indicated by the frequent recourse that litigants had to them; numerous ostraca of the New Kingdom, from the Theban necropolis, tell tales of petty theft, debt, and commercial disputes were decided in the shrines of the local deity, the deified king Amenhotep, who nodded in question to the powers put to him by his priest (Erman, Sitzungsge. d. k. Pruss. Akauf, 1900; and Divination [Egyptian]). The retaining justice seems to have superseded all others in the XX1st and following dynasties; and, since

1 Not seldom the pilgrimage was not performed during a man's lifetime, but his mummy was taken to Abydos before the final burial rites.
this is the period at which the power of the priest was paramount, we shall probably not err in interpreting the frequency of trials by oracle as due to a deliberate policy of the priesthood, who would naturally wish to bring secular matters, as far as possible, under their own control. 'Right or Truth,' from the earliest times conceived of as a goddess (see Lanzoni, *Diz. di mitologia egizia*, Turin, 1881-86, pp. 276-280); for the Egyptians, like the Romans, were by no means averse to conferring on their own oracle the character of a deity. Many nobles, and especially the judges, received the title of 'priest of Maet'; and in the New Kingdom we even hear of a 'temple of Right.' Whether this was an actual shrine or another name for the law courts is not certain; it is not unlikely that Maet enjoyed a regular cult. The sole significant epithet given to her is 'daughter of Re'; this relationship is explained by the pleasure that the sun-god was supposed to take in virtue, it being even said that 'Re lives upon (i.e. eats) right' (maet). In this connexion may be mentioned a ceremony daily practised in the temples: the king (or his substitute, the High-priest) after he has 'gone a round the image of Maet, seated upon a basket or basket-like vessel, a feather on her head, and the sign of life in her hands. The meaning of this offering is not entirely clear. It may be a substitute for the image of Maet, or it may be a memorial of her being sent forth in the image of the sun-god, or it may be the goddess Right Nyx, the personification of ethical or of intellectual righteousness.

12. Law and punishment. A few words must be said about Egyptian conceptions of law and punishment. For 'law' the word was hap, a term also employed for 'custom'; the etymology is unknown. The Egyptians codified their laws, as indeed everywhere in Egypt was committed to writing. Of the laws themselves we know little beyond what the Greek writers have to tell us. In the two central courts of justice the vizier sat with the forty parchment rolls of the Law open before him (Newberry, 2); still it was apparently enjoined upon him to pay no less attention to equity than to law (ib. 10. 4). The Egyptian word for 'punishment' (abodyet) literally means 'teaching,' punishment probably being regarded in the light of a lesson and example to others. Egyptian punishments seem, on the whole, to have been less severe than those inflicted in Babylonia; but magistrates prided themselves on making a proper proportion of the offenders. Thus, one official states that he inflicted hurt on him who inflicted hurt' (Urk. iv. 969), and that he 'punished the evil-doer in accordance with his evil-doing' (ib. iv. 968).

13. Specific moral concepts. We now turn to the special side of our subject—the moral judgments concerning particular vices and virtues. The field to be covered is so large that it has been found impossible to emphasize any but the most salient facts; what is here given must be supplemented by the information to be found in specific articles.

(1) Honor. This, of course, forbidden: 'I have not slain, I have not commanded to slay' (Conf. A). That in certain cases magistrates possessed powers over life and death is implied by the statement of an official: 'There was none who died by my counsel' (Hannover, 11 R.T.A.P. 22. 4). Later, in the XVIIIth dynasty, the king reserved to himself these powers; the vizier might inflict only such punishments as did not involve the cutting off of a limb (Newberry, 2. 15). How absolute was the might of Pharaoh is shown by the advice that is given to the king in a St. Petersburg papyrus: 'Do not kill a man whose excellence thou knowest' (Pap. xiv. [1576] 108). In a case of high treason, the condemned were allowed to make away with themselves (T. Deviria, *Le Pap. judiciaire de Turin*, Paris, 1868). To kill an adulterous wife seemed to the Egyptians quite legitimate (Pap. d'Orbigny), and a similar punishment might justifiably be exacted from her paramour (Pap. Westcar, p. 3). The Egyptian idea of punishment is not unfamiliar to the Egyptians is shown by the phrase which describes any heinous crime as 'a great crime of death.' No compunction was felt in putting captured foes to death (Amada Steiet); such an act had, indeed, a religious sanction as a sacrifice to the god who had sent Pharaoh forth to war. Magicians made waxen images of those whom they wished to destroy (Pap. Leo); but this practice was, of course, condemned by law.

(2) Human sacrifice was undoubtedly practised in ancient Egypt, notwithstanding Herodotus' explicit statement to the contrary (ii. 43). The monumental evidence still needs collection and sifting, but there is little doubt that it will confirm the affirmations of the classical writers. Diodorus (i. 88) speaks of offerings of human beings made upon the tomb of Osiris; and Plutarch preserves a tradition that the priests of Isis sacrificed men (Lampron). The fact that red-haired men were burnt alive in Eileithyiaspolis (de Is. et Osr. 73, with Parthey's valuable note, p. 272.) We hear, too, of similar sacrifices in Heliopolis, for which, however, King Senusert III, who substituted (Porphyry, de Abst. ii. 55). The models of servants who were buried together with their lords very probably exemplify the same kind of substitution. It has been thought that the ceremony of the tiknu, which was practised at funerals, involved human sacrifice; but this is by no means certain.

(3) Cruelty. Some of the facts that have already been mentioned might be thought to indicate that the Egyptians were cruel of disposition; but the treatment of enemies, the punishment of criminals, and religious immolations were, in all lands of antiquity, equally ruthless and barbarous. It may be added in this connexion that in warfare the Egyptians were accustomed to cut off the hands or the phalli of the slain. Criminals were frequently deprived of their ears and noses (Decreus of Haremheb; Inscr. of Mes). The ordinary punishment, however, was the bastinado, which was as freely used under the Pharaohs as in the Egypt of one hundred years ago. Not even men of rank were exempted, as the following example from an official of the Old Kingdom asserts: 'I have never been beaten before any magistrate since I was born' (Urk. i. 75). The general impression gained from the inscriptions is that the Egyptians were too easy-going and good-tempered a people to be cruel. The infliction of unnecessary pain was deprecated: when a Pharaoh suggested to a magician who claimed to be able to replace a severed head that he should try his skill on a condemned prisoner, he was asked to rest content with an experiment on a goose (Pap. Westcar, 8. 16).

(4) Kindness and benevolence. Egyptians often claim to have been 'kindly, loving, loving.' The works of Ptahhotep praise the man who is conciliatory and friendly; he will find his reward in days of misfortune (Prisse, ii. 11). 'I have not oppressed (my) fellow,' 'I have not cast aside, that I be saved from the Negative Confession (A). The poor and afflicted were held to be particularly in need of kindness; 'I was father to the orphan, a kindness in the cold shelter to the cold' (Hannover, 11 R.T.A.P. 4); 'I saved the miserable man from him who was more powerful than he (Petrie, *Veter. Papyri*, London, 1900, p. 6). Suplicants were to be treated with exceptional patience:

'It then art a ruler, be willing to listen when a suppliant speaks. Do not repel him until his body is rid of that which he
Intended to tell thee. He who is in trouble loves to pour out his heart concerning that on account of which he is come. When a man repents, petitioners, people say, 'Why does he dis- believe them?' (Priss, 9, 3-6).

(5) Charity. — No virtue was more incumbent upon the rich than generosity to the needy: 'He who is hungry, he is shamed,' (Erke, i. 132), and like phrases, encounter us at every turn. 'I caused the peasant to carry home corn together with his wife, and the young one by his shoulder; this I brought to her son.' In the house of Nebet (T. L, Grifith, Sioi, London, 1898, pp. 15, 9-10). An ostracon of the Nineteenth Dynasty, of which specimens are rare. A man old with not having adopted a son (Berin Pap. 10627).

(6) Hospitality is partially covered by the quotations already given. In one passage it is read: 'Do not make a funeral feast without thy neighbours, in order that they may stand round thee mourning on the day of burial' (Petrie Ostraco, 11). In another passage it is said: 'Do not sit at meat while another stands, but stretch forth for him thy hand towards the food'; for 'one is rich and another poor,' and 'I who am rich last year is a wayfarer this' (Any, 7, 2-6).

(7) Regard for old age. — To accent the aged was regarded as highly meritorious; but it would appear that this was looked upon less as a duty towards a highly respected class than as an act of charity towards the feeble. The disadvantages of old age were vividly present to the Egyptian mind (Priss, 4, 2-3-3); but, on the other hand, length of years was brought with it honour and esteem (touak). The Egyptians frequently expressed the hope that they would attain the age of 110 years. The vizier Rekhmire says of himself: 'I tended the old man, I gave to him my staff, and comforted the woman in old age' (Newberry, 7, 23). To bury the aged was a virtuous deed (PSBA xviii. 1895-96) 196); to scoff at decrepit old people, a very wicked one (Petrie Ostraco, 11).

(8) Regard for parents and close relatives. — A Theban high priest thus describes his behaviour towards his father: 'I was a steadfast son by my father's side while he was yet upon earth. I went in and out at his command, and transgressed not the utterance of his mouth. I did not make little of that wherewith he charged me... I did not pierce him with many glances, but my face was downwards when he spoke to me. I made not bold to do that whereof he was unaware. I knew not the handmaid of his house; I lay not with his serving- maid. I did not curse his better; nor did I enter before him without permission. I was a poor man, the largest of the XXVIII dynasty quietly remarks that he 'did not strike his father upon the cheek.' (Priss, 17, 10-12)

Filial obedience was rigorously incutated: 'An obedient son is a follower of Horus; it fares well with him in consequence of his obedience to his father and to the last of his actions, and reverence, and belles the same to his children, renewing the teaching of his father' (Priss, 17, 10-12).

In return, the deceased parent would come back to visit his home of the living, and to be a protection to his heirs (Max. Any, 3, 4). In return, the deceased parent would come back to visit his home of the living, and to be a protection to his heirs (Max. Any, 3, 4).

Though, as has been shown, the duties towards the father were considerable, the mother was accounted nearer of kin; the maternal brothers ranked among the same father only (e.g. Priss, 10, 8) and heathen, at least in the royal and princely families, was reckoned in the line of the mother. But it was, above all, the mother's tender care to her children that gave her so great a claim upon their affection; the Egyptian moralist pleads the cause of the mother in eloquent words:

'Give back to God the encomium that thy mother gave thee. Support her as she supported thee. Long did she bear the burden of thee, and forsook thee not. When thou wast born after thy ten years of study, she carried thee on her shoulder; three years long her nipple was in thy mouth... she put thee to thy feet when thou shouldst write by thy letters, and waited upon thee daily, bringing food to the hungry ones in thy house. Thou becamest a stripping and didst take to thee a wife, and art established in thy house. Cast around thine eye for one who hath borne thee, seek the that he does not shew her for her own sake, but only for the sake of the children she may have borne (Erman, Lebensmilde, 79). The wife was, nevertheless, to be well treated and loved:

'If thou art well-to-do, found a house, and love thy wife accordingly. Fill her house and clothes to lick; oil the medicine of her body. Gladden her heart by lifetime long. She is a field that is productive unto its lord.' (Priss, 10, 6-7).

The Egyptian monuments everywhere depict husband and wife in attitudes of affection, and the phrases 'his wife whom he loves' and 'his sister whom he loves' are amongst the commonest ex- pressions found in the hieroglyphic epistles. It is to be shown to the woman who is wayward and given up to amusements: 'Be kind to her for a season, send her not away, give her food to eat.' (Priss, 15, 6-7). How tender and passionate the love of an Egyptian could be is shown by the love poems that have survived (see Max Muller, Die Lebenspoesie der alten Assyrier, Leipzig, 1899).

Polygamy seems to have been permitted, but to have been unusual; brother-and-sister marriage was not rare. Divorce seems to have depended on the caprice of the husband; but the latter bound himself by contract, at least in later times, to pay an indemnification for his divorce. 'If he executed the will of his wife without valid reason (see Griffith, Rhylands Papyri, London, 1909, iii. 116). The divorced woman, like the widow, often stood in sore need of protection (Elopogon Pagan 10, 63); but, since women were another world of property, either position was doubly often very tolerable. The lady of means, from the most ancient times onwards, bore the titles "mistress of his house," "mistress of his (/er/-house," and the position of a woman was higher than in any other land of antiquity; not only could she administer her own possessions, but she had testamentary rights and the power to go to law (see Griffith, The Inscription of Mrs, Leipzig, 1905). In Egypt had many great queens, of
whom several reigned independently and with great power, e.g. Hatashep, the XXVIth dynasty.

(10) Sexual morality (for adultery, see above under the heading 'Homicide' and art. ADULTERY [Egyptian]).—Our ancient immorality was very lightly regarded; we find no prohibition concerning it in the Negative Confession, and a lord of Elephantine in the VIIth dynasty even boasts of 'having had a good time with women' (ZA xlv. (1910) 45); and the daughters of the dancing girls who attended the feasts given by grandees doubtless belonged to the prostitute class. The moralist gives a warning against women of this type:

'Beware of the strange woman, who is not known in her town. Approach her not ... and know her not in bodily wise. A deep and unsavourable water is the woman who is apart from her husband.' (Ang. 2, 8-15).

Religious prostitution is attested by Strabo (xxvii. 1. 46) for the priestesses of Amun of Thebes until the age of puberty, when they were given in marriage. The monasteries afford no direct confirmation of this statement, but certain indications make it probable that it is no mere invention.

(11) The moralist insists that the 'chasseres' (Chenapt) constituted his harit (khnh), and the wife of the high priest bore the title 'chief of the ladies of the temple' (ZA 1903). In prosperity the New Kingdom most ladies of rank, married to men in high stations, called themselves 'chasseres' of one god or another; even goddesses had their haritmas (ZA xlvii. [1910] 50). The Pharaohs had large harems, and it is improbable that concubinage on a considerable scale was confined to the royal house; but we are ill-instructed on this point. The paynrt of the New Kingdom give the paynrt theiger orders, as, for example, the workmen of the Theban Necropolis, usually formed loose temporary connexions in lieu of legal marriages (see Erman, Life in Ancient Egypt, tr. Tirard, London, 1894, p. 164).

An erotic paynrt (at Turin), full of pictures of the strangest kind, shows that few of the sexual vices of the Orient were unknown to Ancient Egypt. In a magical paynrt of the XIth dynasty, Seth appears as a priestess seeking to declare the paynrt of the Harir Hor (Griffith, Hieratic Paynrt from Khnum, 1899, p. 3; cf. Spinhz, xiv. [1910] 39-41); and it would appear that this crime, as adultery, was a stock charge in the indictment of murder. In the law-codes (see Turin, Pap. 55. 4), in both versions of the Negative Confession, impurity (mastrubation?) while serving as a lay priest of the god is denied.

Purity. —Cleanliness, both of the person and of the clothing, was scrupulously observed; and the houses of the wealthy seldom lacked a bath-room (Sinuhe B, 285). The washing of face and hands was considered the necessity preliminary to a meal (Griffith, Stories of the High Priests, Oxford, 1900, p. 44), and sexual acts of all sorts were regarded as defiling. Purity in the service of the gods was strenuously insisted upon (ibid. ii. 27) and all grades of priestly, professional and lay, shared the name of sob, 'the pure priest' (see, further, PURIFICATION [Egypt]).

The concept of ethical purity was also known, though it was less play a very prominent part. Thus do we find it at the end of the earlier Repudiation of Sons (A); and in b in the metaphorical sense means 'to be innocent' (Pap. Mayer B, passim).

(12) Slavery.—On this subject we have strangely little information. Slaves of war were often presented as slaves, both to individuals (e.g. Uruk. iv. 2. 11) and to the gods (e.g. Newberry, 21).

There can be little doubt that slaves were very numerous, but we have no early evidence as to the sources whence they were recruited, or as to the question whether they were ever emancipated. From the XXVIth dynasty legal deeds exist recording the sale and transfer of slaves; also voluntary contracts of servitude, involving not only a man's person but also his children (Griffith, Byland's Papyri, iii. 50 ff.).

(13) The right of property.—The official theory in Ancient Egypt was to the effect that the Pharaoh is the sole owner of property; if his subjects hold the land, the local god has given it to them; but it is because the king has granted them leave to do so; even the tombs of the dead were 'the gift of the king.' The temples of the gods, too, were the castles which the Pharaoh, their son, had built for them; and each successive monarch confirmed to the gods the possessions accorded by his ancestors (see Moret, La Royauté pharaonique, Paris, 1900). Similarly, the booty captured from foreign tribes was theoretically regarded as tribute which rebellious subjects had failed to render. In practice, this theory of property corresponded with the reality just in the degree in which the royal power was exercised on the surface of the land. Conquerors who (like Amenemnes I. and Amos 1.) reduced the land to order after a period of anarchy rewarded their subjects with grants of land pretty much as they chose. In periods of war, the result was a show of confirming (simite) already existing rights; or the latter might, as in the first half of the XIth dynasty, be actually under the control of feudal families, or, as in the XXIst dynasty, be usurped by a ruling priesthood. The official formula remained the same throughout Egyptian history, and might doubtless have been used to justify taxation, if, indeed, this question was ever raised. In any case, the function among a variety of proprietors, all tenancies of their proprietorship, which was attested by title-deeds and carried with it rights of testamentary disposition and alienation by sale. The elaborate care with which the land was surveyed and registered is only partly explained by the Egyptians' inerterate love of committing things to writing; documentary records were an absolute necessity in a land where the inundation was apt to sweep away all boundary marks. It was a primary duty for those in authority to protect proprietary rights, and the nobles frequently recorded the fact that they had been debarred from his property by one more powerful than he (Urak. iv. 972), and that they had 'never deprived a man of the estate of his father' (ib. 1. 125). A great portion of the land was in the hands of the priests, being theoretically considered the property of the gods. To such limits did the encroachments of the priesthood go, that in the XXTh dynasty, Amun of Thebes possessed no less than 654,188 stot of land, 492,362 head of cattle, 433 gardens and groves, and 86,486 serfs and slaves (see Breasted, Anc. Records, Chicago, 1906-7, iv. 97).

The crime of robbery is frequently mentioned:

'Never have I taken away the property of any man by robbery' (Urak. i. 79; and the subject of a well-known tale of the Middle Kingdom, wherein a peasant who has robbed his son-in-law, and its loot on a trumpery pretext, and who demands justice from the administrator of the province. Vogelsang-Gardiner, Die Eingen des Leibes, p. 141).

Robbery is distinguished from theft in Confession B; it is curious that A makes no reference to either sin. Many ostraca and papyri deal with cases of petty theft, but throw no light on the penalties imposed on account of it.

The decree of King Haremheb mentions some stringent reforms carried through by that Pharaoh; the official tax-gatherers had been committing the oppression of the poor and oppressing the peasants; these offences were thenceforth to be punished by banishment to the frontier fort of Zaru, after the
1. The rich equipment of furniture and jewels buried with the wealthy dead was an easy booty to unscrupulous men, and tomb-robbery was committed on a large scale.

2. In the XXth dynasty it was found that many royal tombs had been tampered with, and the legal investigations then instituted afford a graphic picture of some of the most interesting documents from Ancient Egypt (see Newberry-Spiegelberg, Ezzations in the Theban Necropolis, London, 1898).

3. 'A man who affirms that Truth—Truthfulness was highly esteemed and was barely distinguished from right, both concepts being denoted by the same word maat. In Confession B the deceased says: I have not spoken falsehood.'

4. In the court-law the ordinary oath was 'As Amon liveth, and as the Prince liveth,' but often there were added long and circumstantial self-curses specifying the penalty to be incurred if what is said proves to be untrue (see W. Spiegelberg, Rechtsvorsen, Hanover, 1892, and Gardiner, Inscription of Mes). Lying became a serious offence when it involved the interests of others:

5. 'I have not said lies concerning another,' an official maintains (Urk. iv. 120); and 'I have not betrayed the servant to his master.'

6. To render messages faithfully was thought a desirable habit (Prisse, 7. 3; Urk. iv. 120), and reliability and obedience towards one's masters are virtues everywhere praised. Honesty in commercial transactions is emphasized in those statements of Confession A which refer to the units of measurement and to the balance. The stemming or diverting of irrigation water (Abl. iv. 3) and what the Egyptians termed 'over irrigation played so important a part as in Egypt, was, of course, a common way of obtaining an unfair advantage over other persons. (Prisse, 11.)

7. 'The endeavour of the magistrate was not only to 'cause the two parties to go away satisfied' (Newberry, 4), but to administer the laws fairly and in accordance with the command of Pharaoh (ib. 10.). Great stress was laid on impartiality:

8. 'Regard him whom thou knowest like him whom thou knowest not.' Again it is said, 'To put upon the one side—the metaphor seems to be from overweighing one scale of the balance—'is the abhorrence of God' (ib.). The judge must, of course, be wholly incorruptible. 'I have not been dealt to the empty-handed, I have not received the bribe of any,' says the vizier Rekhmire (ib. 5. 54). In the case of which we have full details (XXth dynasty), a commissioner was sent out to make some investigations, and came back with a false report to the chief of the commission; it is clear that he had been bribed by one of the parties (Gardiner, Inscription of Moa).

9. The insistence with which the inscriptions refer to incorruptibility and impartiality suggests that these virtues were less common than was claimed; none the less the ideal of modern Egypt discoursed this supposition. The emblematic picture of the judge drawn in Tuthmosis III.'s charge to Rekhmire is up to a high standard of moral enlightenment. Besides the indispensable qualities of justice and incorruptibility, it demands uncomplaining patience, tact, and discretion; not to be over-lenient or over-stern, allowing the litigants to have their say, and making it quite clear on what grounds the verdict is given (Newberry, 10).

10. Menemnon in everyday life.—Good-temper was enjoined and admired. The chief hold (ib. in Tomb in Gurna, no. 110), takes credit to himself for having been of pleasant character, self-controlled, and free from passion: 'I have not been hot of mouth,' i.e. not in reply, is one of the few statements in this manner. Pharaoh, indeed, might allow himself to be enraged like a leopard of the South' (e.g. Urk. iv. 130), but his subjects had no licence. Con- tentiousness was considered a fault.

11. One moralist gives the precept, 'Do not persist in fighting with thy neighbour, Petrie Ostraca, and another advises, 'Enter not into the law-court, lest thy name stink' (Day, 2. 17).

12. Rancour was blamed, and men are bidden not to store up memories of small wrongs (Petrie Ostraca, 11); and the judge is frequently enjoined, 'Do not be quick to anger, the fear of evil' (B) may refer to the virtues of for-giveness. Among the fatalistic Egyptians of today, gratitude is said to be almost unknown. There is no exact phrase for gratitude in the old Egyptian language, for 'to praise God' (B) is for some one is rather to congratulate him than to thank him; in Coptic 'I am grateful' is rendered by oymesot wnt', 'a favour has been received.' The forgetfulness of benefits received, however, calls forth bitter comment in some of the texts:

13. 'Yesterday is not remembered, and to the door is not done again in these times' (Lebenenmite, 113). 'A man has no household on the day of the dead, he who seeks of his food conspired against me' (Millingen, 2. 5).

14. On the subject of friendship the ethical writers have much to say. The reflection contained in the words last quoted should teach the king to place confidence in anyone else (Millingen, 1. 2). If a proper means is condemned: 'Do not make straight what is crooked in order to win love' (Petrie Ostraca, 11).

15. 'Defiance to superiors was a duty imposed on all: 'How thy back to thy superior, thy overseer from the Palace' (Prisse, 15. 2). Distinctions of rank were jealously guarded, and etiquette prescribed a strict order of precedence. The pictures in the tomb-chambers show how the inscriptions declare that nobles were not expected to stand in deferential attitudes. Before Pharaoh all his subjects grovelled in the dust, touching the earth with their foreheads; and it was considered sufficiently lavish to be allowed to kiss the foot of the king's foot instead of the ground (Urk. i. 33).

16. Courtesy and tact were prescribed, especially in the company of men of position:

17. 'If thou art seated at the board of one greater than thee, take what he offers thee: 1... Look straight in front of thee; pierce him not with many glances... Speak when he addresses thee, and laugh when he teases; it will please him greatly' (Pap. Brit. Mus. 10500, 2. 18-19).

18. That obedience was exacted from inferiors goes without saying; but even so high an official as I{nemii affirms (Urk. iv. 172), 'I was one who means to do what the master said.' Pride is very often spoken of as a failing: 'Do not be proud, lest thou be humbled' (Prisse, 12. 1). Of intellectual pride it is said:

19. 'Do not vaunt thy heart on account of thy knowledge; take counsel with the ignorant as with the wise. For the limits of a craft is not to be reached; there is no perfect craftsman. A good saying lies hidden more than an emerald; it is to be found with slave-girls grunting at the mill' (Prisse, 5. 9-10).

20. The poor man is not to be treated harshly (Pap. Brit. Mus. 10509, 3. 6), for 'he possesses virtue possesses riches' (Prisse, 7. 5). Nor should contempt be shown to him who has no children, for 'there is many a father in misery, and many a mother, and one is no more a mother, and one is no more a father' (Prisse, 7. 6).

21. The Negative Confession has several references to pride and vanity: 'I have not been
puffed up,' 'I have not compared myself with others.' No quotations are required to illustrate the great love of ostentation characteristic of the Egyptians in their material and moral life, for it is apparent from the evidence of the excavations that ancient people were incurable braggers, never so contented as when airing their virtues and displaying their own cleverness. The characters of the greatest of the 18th and 19th dynasties has as its subject the rivalry of two scribes, each of whom tries to demonstrate his superiority over the other by boasting about himself, while emphasizing the records of his fellow (Guizot, Heriot Texts, Leipzig, 1811, p. 3).

Discretion was very highly valued; of many men we are told that they were 'deloused of mouth concerning what their eyes saw' (Benson-Gourlay, Temple of Mut, London, 1899, p. 326), or 'secretive in the business of the Palace' (Urk. iv. 47). The utility of silence was very well understood, and it was prescribed as the best mode of coping with many difficulties (Priisse, i. 1; 7; 5; 9). So, too, in B, 'I have not multiplied words in talking.'

(17) Qualities and defects of character.—Under the word 'character' we mean the esteem or regard in which a man is held with the various traits of character of which the ethical nature is more or less clearly defined. Drunkenness was the invariable ending of feasts, and it seems to have been looked upon as a good joke rather than as something culpable. In the tom- paintings, men are shown being carried home drunk on the shoulders of their companions; and not seldom we are allowed to see a fashionable lady with her attendants, while an attendant rushes to her assistance. Drunkenness is, however, sometimes deprecated as a bad habit, as in the following passage: 'Nicht zu trinken, geht es besser, Alkohol ist ein Gift.'

(18) Duties towards the dead.—In view of the care and thought which the Egyptians expended on the construction of their tombs and on the continuation of their funerary cult, it is strange that public opinion imposed no adequate obligation to fulfil the intentions of the departed. It is an undoubted fact, and one not untinged with tragedy, that magnificent tombs, ornamented with exquisite skill and equipped with the costliest furniture during the life-time of their owners, were within a few years suffered to fall into decay, and even to become the undisputed prey of tomb-plunderers. Filial piety, as we have seen, demanded that the son and heir should accomplish his parent's burial rites; but it may be assumed that none but a few shrirked this duty.

But this first perfunctory service by no means ensured the permanent welfare of the dead; offerings had to be made, and these were often not for a few years only, but in perpetuity. It seems certain that the attentions paid to the dead seldom extended beyond a single generation; and in this respect Ancient Egypt stands in sharp contrast to China, with its universally-recognized cult of ancestors. The Pharaohs, it is true, were more assiduous in their veneration of their forefathers than the bulk of the people; but, with a little qualification, it may fairly be said that in Egypt the cult of the dead existed only in demand, not in supply. See, further, ANCESTOR-WORSHIP AND CULT OF THE DEAD (Egyptian).

(19) Duties towards the gods.—In lands where, as in Ancient Egypt, an official cult of the gods has been established—wherever, in fact, religious observances are not dictated by mere individual desires—this cult and these observances become a duty. The only question is whether the obligation falls on the shoulders of the people at large or is vicariously discharged by a specially-appointed priesthood. The Egyptian priesthood was only in part professional; whence it follows that private persons, so far as their wealth and position prescribed, took part in the public worship of the gods. How far the populace at large attended to, or were supposed to attend to, the gods of the State will be discussed in such an approach to the moral life (Egyptian); here it will suffice to quote a precept which enjoins on all men generally the observance of the Divine feast days: 'Mako the feast of thy god, and repeat it in its season.'

He is neglected ' (Any, 2. 3-4). Various religious offences are mentioned in the Negative Confession, including fraudulent diminution of the temple offerings, the slaying of sacred animals, and blasphemy. There were also prohibitions as to food, rules of purity, and much else that cannot here be discussed. The fact that the gods regarded virtue (see above) proves that righteousness was regarded in a very high sense, as a duty towards them, and, owing to this religious side of ethics, the relations of a man with his deity might become very intimate. Certain votive steles of the New Kingdom exhibit the nearest approach to personage that is found in any Semitic inscription. (Thoth, 140) "A Thot (Thoth's) self described as a miracle of valour, and is compared with the lion for prowess and with the bull for strength. The purport of steles is the last words that will be mentioned under this heading; it falls within the province of ethics as being dependent on voluntary effort, and as being an object of general approval.

The man 'who knows things' (rakh idkhet) was held in high esteem by the Egyptians, and they often speak with pride of their intellectual attainments.

'Thus Rekheb, the son of Nebhepet, Theodore, having been made a 'high official,' the cult of the dead is said to be the noblest of the three high-Christ; and, ardent in inquiry, and a ready listener.' 'I was skilled,' he says, 'in the ways of the past, and the things of yesterday caused me to know them in her name.' ('Newberry, S. 25-30.)

Conclusion.—In conclusion, a rough moral estimate of the Egyptians may be attempted.
ETHICS AND MORALITY (Greek).—I. Homeric age.—The mental attitude of the society which Homer depicts was neither introspective nor agitated by moral doubts. It belonged to an age of physical strength, of bodily vigor, courage, and resolution more highly esteemed than unswerving rectitude or pre-eminent wisdom. The sagacity of Nestor was treated with formal respect, but he had lost in the fullness of age the position which he held and benefited from his experience. On the other hand, the counsel of Odysseus was the more readily welcomed in consequence of his practical resource and military skill. The authority wielded by the children of Odysseus over their feudal retainers depended on their power to enforce it: in the absence of Odysseus and Achilles, Laertes and Peleus were too old to watch effectively over their sons' interests, and Telemachus was a mere stripling was ignored. Similarly, the nominal over-lordship of Agamemnon failed to coerce Achilles, who was strong enough to assert his independence. Thus the exercise of the human virtues was restricted to the bounds of family or clan; but within these limits we find evidence of a highly developed morality. The sanctity attached to the marriage bond may be illustrated from the wonderful picture of Hector and Andromache and of Odysseus and Penelope, and the supreme happiness of a well-assorted union is recognized in the words of Odysseus to Nausicaa: "There is nothing greater or better than a husband and wife dwelling together with united minds." (Od. vi. 182 f.) The position of women recognized in the Homeric poems—but always within the limits indicated above—was characterized by greater freedom and influence than was customary at Athens in later times, as may be seen in the several cases of Penelope, Nausicaa, and Arcte the wife of Alcnoous (Od. vii. 66). Various causes have been assigned for the change, such as (1) the fact that the women described in Homer belonged to a privileged class, (2) the necessary secessions imposed by the conditions of town life, and (3) the contact with the Ionian civilization of Asia Minor (see Malan, Social and Religious Life in Greece, London, p. 147, and T. D. Seymour, Life in the Homeric Age, New York, 1867, p. 117 f.). Seymour, in suggesting (p. 123) that the society of Homer was Eolic rather than Ionian, refers to the abuse directed against the Eolii posteces by non-sympathetic Ionians.

There is similar evidence of sympathy with children (see esp. H. xv. 362, xxii. 499). The cases of Euryklea and Eumene show that slavery was compatible with relations of intimate affection. Odysseus, during his absences from his household. Beggar and suppliants were treated under the special protection of Zeus, and had an indefeasible claim to hospitality (Od. vi. 298, xii. 213). The same mild spirit was shown in the gentle treatment of the lower animals, such as horses and dogs; and the example of the old dog Argus (Od. xxv. 228 ff.), who recognized his master after twenty years' absence, is familiar to every one. The claims of morality as thus acknowledged imposed obligations which could not be broken without offending public opinion. The sense of honour (φιλοθυμία) corresponded to the feeling of resentment ( νιγρεια, as in H. xii. 122) with which a disregard of propriety was visited. Nevertheless, behind all these manifestations of refinement and generosity there was a dark background of hardness and cruelty.

In his wrath the Homeric hero was a savage. Patroclus slew the son of Amyntha in anger over a matter of reserve (H. xii. 86), and Achilles was afraid lest his passion should drive him to kill the defenseless Priam, who as assailant and guest could claim his special protection (H. xiv. 568, 569). Mutilation of an enemy is mentioned over and over again without reprobation (see H. xi. 145, xii. 292, xiv. 49, etc.). The punishment of the treacherous slave Melanthius is carried out with brutal and repulsive ferocity (Od. xii. 474 ff.). In fact, in dealing with those who were beyond the pale, the heroic warrior showed no pity for unprotected weakness; when a town was captured, the old men and children were slain, and the women were carried off as the property of the victors (see H. xii. 82; Od. vii. 502 ff.).

II. H. ii. Gardner.

2. Homer.—The poems of Hesiod, whether belonging to a time somewhat later than Homer or expressing the sentiments of a lower grade of society not articulate in the Iliad and the Odyssey, may be regarded as a bridge which crosses the gap dividing the heroic from the historical age. For in the Works and Days we find the earliest signs of a conviction that all is not well with the world, that the gods no longer dwell with men, and that even honour and respectability (τιμή and προσωπεία) have departed, abandoning mankind to the workings of harsh and malignant jealousies (200 f.).

"Poet is wroth against potter; carpenter against carpenter; even beggar is envious of beggar, and one man rules another" (22). "Money is a man's soul" (500). Morality is depressed from the heroic level to suit the work-a-day requirements of the struggling farmer. Life is a continual battle against poverty, and the simple virtues which it needs leave no room for the exercise of elevated sentiment. Industry and fair dealing, temperance and simplicity, are enjoined:

"Hard work is no shame; but ill deeds is a disgrace" (311). "Take a good neck-cloth and give as much or as little as return, so that in need you may afterwards find sufficiency" (390). Among the maxims of Hesiod's "Work" his rebuke of the unjust judges who robbed the poor: " Fool! they know not how much greater is the half than the whole, how mighty a blessing there is in mallow and asphodel" (40). There is plenty of shrewd and homely wisdom, breathing the spirit merely of commercial prudence; and we are hardly surprised to find a wise literature of the time a vein of melancholy may
be traced, to be seen in its fullest outcrop when Theognis writes:

'But the best of all things for the sons of earth not to be born, or to see the bright rays of the sun; or else after birth to pass as soon as possible the gate of death, and to lie deep down below the light of day.' (105 E.)

Debarred by stress of present anxiety from celebrating the glories of the past, the creative instinct found an outlet in recording the lessons of personal experience with more individual and passionate outbursts of the lyric poets are of less direct importance to a survey of morality. But the elegiac writers, and especially Mimnermus, Solon, Phocylides, and Theognis, contain a mass of proverbial wisdom to which after ages never ceased to appeal. Trite and commonplace as much of their writing seems to a modern reader, their immediate ances aud judged very differently.

To obtain consistent and true results a change in the ethics of society, politics, and education was to them a new and inestimable privilege. In the gnostic poets the morality which had been merely implicit in Homer and Hesiod received separate treatment and distinct expression. The wisdom which had been expressed in an allegoric way in the 'Divine' mind was tersely and readily condensed into a few pregnant sentences. These sentences formed the data for new synthesyes and higher generalizations, the topics for enlarged investigation, the 'middle axioms' between the scattered facts of life and the unity of the rational system (cf. A. Lyman's, Greek Poets, London, 1877, p. 109).

The poets were, in fact, the educators of Greece (cf. Isocrates, 314). Unfortunately we see K. J. Freytag, Schools of Hellen, London, 1907, p. 247); and to this age belongs the formation of all that was most characteristic in Greek popular morality. The dramatists were steeped in this literature, and their sententious passages are often to be adapted from some gnomic poet: thus Sophocles in Oed. Col. 1225 reproduced the above-quoted lines of Theognis, just as in fr. 320 he paraphrased the last line of Sol. 326 Th. 45.

Similar considerations apply to the traditional utterances of the Seven Wise Men. They belonged to the latter part of this era, the age of the tyrants; indeed, one of them, Periander, was himself tyrant of Corinth, and herer. Pittacus, was the ruler of Mytilene. They were happily described by Diodorus (fr. 28 [P.F.H. ii. 243]) as 'neither admirers nor students of philosophy, but men of intelligence endowed with legislative faculty.' Although Thales and Solon distinguished themselves independently, the others were merely convenient eponyms to whom could be attached such scraps of unappropriated wisdom as were handed down from their fathers, and for the same reason that Thales is said to have acquired the knowledge of medicine from Diels, Fragmenta der Vorschrücker, Berlin, 1907, p. 518). The famous 'Nothing too much,' attributed to Solon and repeated by Cleobulus as 'Measure is best,' comes from the innermost kernel of Greek sentiment. Phocylides (fr. 13) praised the middle rank as the happiest; Solon (fr. 2) rebuked the insolence (ἐφάρμοσι) of the popular faction, arising from the excess which they could not check; and Aristotle followed popular opinion when he defined Virtue as a mean. Closely akin is the saying of Pittacus, ἀρκεῖον ὑθυπό, which is inadequately rendered 'Know the right season,' since caution may be seen from the Latin, 'Est visum quodcumque, et nunc, quia meum pater in aeternum, 60, in quo potuit, et scire posse, quin aliquando, eam quae have not word corresponding to καλός is no less significant than the absence of Greek of terms capable of expressing adequately the ideas of 'duty' and 'sin.' The intellectual aspect of Greek morality appears still more strongly in Chilon's ἐγγύς εὐπρεπες, 'Know thyself,' which, together with ἰδοὺς ὑμῖν, was inscribed on the front of the temple of Apollo at Delphi. In fact, it was less obvious that the advice given by Pythagoras to his pupils, that they should always, on their return home, put to themselves these questions: 'Whither have I strayed? What have I done? Which of my duties was unfulfilled?' (Diog. Laert. viii. 22). But it was capable of a wider significance, and was interpreted by Plato in the Charmides (164 D) as a recommendation of ἑαυτῷ προσφέροντα, understanding thereby a proper examination of the observer of faults by capacity. In this sense it was adopted by the tragic poet Ion (fr. 55): 'Know thyself' is but a brief saying, and yet is a task so great that Zeus himself alone can master it. An increased recognition of the importance of justice is characteristic of an age which continued and developed the strain of wisdom introduced by Hesiod (Op. 320, etc.).

Solon declared (fr. 13) that unjust gains bring their own retribution; and Theognis (197) writes to the same effect, that riches righteously acquired are a sure possession, but dishonesty, though it seems to prevail for the time, issues finally in ruin. And Chion said (fr. 10 [Didier]): 'Choose less rather than shameful gain; for whither the one will lead, the other will never cease to be a curse.' Phocylides (fr. 5 of Theogn. 147) was to so far as to express the same hope for a future judgment; and this view afterwards exercised considerable influence on the ethical systems of Plato and Aristotle (see Aristotle, Nic. v. 1110). The greater the value attached by men to the observance of justice in their mutual dealings, the keener was the disappointment with which they viewed the apparent disregard of the gods in visiting with retribution the transgressions of the unjust. The poets were forced to conclude that, while the actual sinner escaped, his crime was 'repeated by the sufferings of his descendants' (Solon, fr. 4, 22-23). Yet no protest follows against the injustice of the gods: their ways are inscrutable and past finding out (fr. 9). Similarly Theognis, while praying that the purpose of the gods may yet be changed, mournfully acquiesced in the punishment of the innocent for the sins of the guilty (731-742). It must at the same time be remembered that the sense of justice was so limited, as to exclude any consideration for the rights of others. 'Beguile you not your neighbor with fair words,' says Theognis (306); 'but, when you have him within your grip, wreak your wrath on him, and let no one stand in your way. You may pour out your blood; I could drink their blood.' Is another of his utterances (348), when he is speaking of those who had robbed him. These are not isolated sentiments once totruities; they continue to exist in the writings of Diels, Fragm. der Vorschrücker, Berlin, 1907, p. 518). The famous 'Nothing too much,' attributed to Solon and repeated by Cleobulus as 'Measure is best,' comes from the innermost kernel of Greek sentiment. Phocylides (fr. 13) praised the middle rank as the happiest; Solon (fr. 2) rebuked the insolence (ἐφάρμοσι) of the popular faction, arising from the excess which they could not check; and Aristotle followed popular opinion when he defined Virtue as a mean. Closely akin is the saying of Pittacus, ἀρκεῖον ὑθυπό, which is inadequately rendered 'Know the right season,' since caution may be seen from the Latin, 'Est visum quodcumque, et nunc, quia meum pater in aeternum, 60, in quo potuit, et scire posse, quin aliquando, eam quae...
withhold his countenance from righteous deception,' and 'There are times when God honours a lie.' Flinders (Legg. [AD 127]) explicitly affirms that the many are too fond of saying that at proper times the practice of falsehood may be justified. Sophocles often follows closely the precepts of popular morality; and it may be concluded from the evidence he affords that falsehood was justified either in cases where it brought final success in a momentous issue (Phil. 109; fr. 326), or even where some definite advantage was perceived. 'This is the fruit of falsehood' (fr. 749). 'No speech is evil, if fraught with gain' (El. 61; cf. Athen. 122 C).

It has been suggested, on the strength of the Attic evidence, that in the period between Homer and the Persian wars, under the influence of the Delphic religion, a higher estimate of truthfulness was prevalent than in the subsequent period (L. Schmidt, ii. 413). This is a mistaken view, due partly to neglect of the fact which has already been emphasised, that the tragedians constantly echoed the sentiments of the genuine poets, adapting them to the conditions of their art, or ascribing them to their most conventional characters.

4. The era of the Persian wars.—It may be broadly affirmed as a general proposition that the conventional morality which can be gathered from the plays of the earlier tragedians, which may be fairly described as epoch-making, the time which elapsed before the establishment of the Macedonion empire was far too short for the new radicalism of the advanced thinkers to produce a direct effect in the theatre, or even in a community so sensitive to novelty as Athens. The conviction of Socrates is enough to show that the majority shared the sentiments of Strepiesades in the Clouds, and would willingly have lent him a hand in setting fire to the 'Reflector,' so soon as they perceived the danger of an inroad on their cherished prepossessions. Hence it would be a mistake to derive the bias of contemporary opinion from the sympathies which may be aroused by this or that play of Aeschylus or Euripides. Nor must this be understood as applying solely to subjects which excited the keenest controversy. For example, the Irregularities of Euripides is mainly devoted to a panegyric of Athens as the protector of the weak, and the advocate of generosity to a beaten foe (see Introduction to the edition by the present writer, p. xxvi, f.), not at the special time when this play was produced, the assembly was debating the Mytilenean decree; and the atrocities of Scione and Melos occurred not long after. It is dangerous to infer an advance in general morality because a few enlightened thinkers might condemn the execution of Peloponnesian envoys in retaliation for the similar treatment of traders in contraband (Thuc. ii. 67), or because the ruthless proceedings of a Spartan admiral evoked a general protest from Ionia (iii. 32). But to assign to literary evidence its necessary limitations is not to disparage the value of its feature. The true spirit of an age is to be gathered from the aspirations of its leading minds; but, when we finally leave the era of the tyrannies and encounter the first fresh breezes of democratic Athens, it behoves us to remember that the individual witnesses will be less likely to conform to a general pattern.

The effect of the Persian wars, following closely upon the democratic reforms of Cleisthenes and the expulsion of Hippias, was to deliver the Athenians from the danger of political slavery, and to open out an almost unlimited field for their practical and intellectual energies (see Gomperz, L. 392 ff.). Athens, at the head of her maritime league, was the leading member of a powerful confederacy, and was soon to aspire to an imperial role. On the other hand, it is often offered as a common danger had given birth to a new sense of pan-Hellenic unity. The best representative of pan-Hellenic sentiment is Pindar (q.v.) the Theban. He belonged to a State which had been reduced to a powerless condition, and had to have been heavily fined by his countrymen for his praise of Athens in the poem partly preserved in Ira. 76, 78, and 83. As a writer of odes in honour of victorious competitors, he was one of the great festivals from every quarter of the Greek world, he displayed an extraordinary sympathy with the local associations of his patrons' families, and testified to the unity of sentiment and tradition in the Greek race which Salamis and Plataea had made a living reality. He was so little a particularist that all Greece could feel proud of his genius. So in part he continued to expand the familiar axioms of the national ethics with a wider outlook, a more elaborate imagery, and a more varied application. No one perhaps so well illustrates the central Hellenic principle of σωφροσύνη, the need of self-control, the reduction of all excess to the normal, and the highest required by the interests of society (Gomperz, i. 301).

Even the highest ambition, the desire for the fame which song alone can give (Nem. vii. 27), must be controlled by the fear of going too far. A mortal must shape his aims with a sense of his own weakness; let him not seek to become Zeus (Iph. fr. 14). The pillars of Hercules are set as a limit to human enterprise (Ol. iii. 44). Strain not the eyes too far; the brazen heaven cannot be climbed (Pyth. x. 27). But there are those who, like Tantalus and Ixion, cannot bear the stress of great prosperity (Ol. i. 56; Pyth. ii. 25). Then surfice breeds insensibility, whose child is Ixion. The germ of this thought are to be found in Solon and Theognis, but Pindar and Aeschylus (Ap. Tep.) inverted it with a fuller meaning:

'Perhaps the most striking note in Pindar's poetry proceeds from his aristocratic pride. He will have no commerce with the vulgar, and cares nothing for the jealousy of lesser rivals. Birth is the supreme advantage, and natural powers are the gift of heaven, the want of which no training can replace (Ol. i. 100, ὅ δ' ἐστιν ἀριστουργημα)'

So he concludes from heroic examples:

'A man who hath the birth-right of nobility prevails greatly; but he who has knowledge in a lesson learned is a man in darkness, whose thought is as a veering gale, and who never cometh to port with unerring course, but with infernal mistaet and a thousand excellences' (Nem. iii. 40 ff., tr. Bury).

Great powers should be worthily exercised:

'Humble and happy to be sung in verse is he who, prevailing by might of arm or mind over his enemy, can bear the loss of his strength to win the highest prizes; and who lives to see his son in the like cause exalted and youth crowned with Pythonic wreaths as his due' (Pyth. x. 22 ff.).

While Pindar sang the glories of the great games, Aeschylus (q.v.) was making a more direct appeal to the national honour of Athens. Few poets have left with their readers so keen an impression as Aeschylus of their deep interest in the highest problems of morality. In his fervour for righteousness he has often been compared to a Hebrew prophet. With the issue of the dramatic conflict is involved the solution of an ethical or religious question which permeates the atmosphere of the play. Thus in the Prometheus the sufferings of the chief character and those of those bound up with the justification of the ways of Zeus. It was a leading motive of Aeschylus' poetic activity to find a moral lesson which could be traced among the horrors and cruelties of the old legends, and especially to discover how the interference of the gods in human affairs could be reconciled with the requirements of justice. It is a mistake to consider Aeschylus as a conservative thinker, though he came to be established at a later date. Probably to his contemporaries he appeared as a revolutionary. But, however this may be, he was undoubtedly a lofter moralist than any of the indefinite authenticity of the 'Comedy of the Birds' (Xen. Anab. v. 1. 4. 4 ff.).'
earlier poets. We cannot conceive of him as justifying a falsehood for the sake of obtaining a practical advantage: 'The mouth of Zeus knows not how to lie, and all his words he will fulfil' (Prom. 106). It is equally unpleasing to observe how Æschylus endeavors to give a new and higher meaning into the precepts of the old morality. That suffering was learning was an old saw which in Hesiod (Op. 218) took the form of: 'A child knows which is best when it is brought from its mother's teeth as set on edge ' as completely as the prophet Ezekiel (18%). Agamemnon was not punished for the sin of Atreus. He yielded to the fatal Temptation which was sent to him in the person of Iphigenia, as in the days of his triumph over Troy he forsook his nurse and gave way to Eumeneig (W. G. Headlam in Cambridge Prolegomena, 1906, p. 126). There is always a threat of sin breaking out afresh in the new generation—in consequence of the infant tillm in the blood. But how did the first sin come to be committed? Here Æschylus definitely rejected the traditional view which attributed it to the jealousy of the gods aroused by great prosperity:

But single in the world I hold
A doctrine different from the old:
Not wealth it is but sinful desire
More sinners after him doth breed
Formed in his image (Ap. 754 ff.).

The name of Æschylus was permanently connected with the 'good old days' of the Mapathowenágas; and old-fashioned citizens at the end of the century still held him to be the greatest of poets (Aristoph. Nub. 1380), and attributed to his teaching the virtues of the generation which grew up under the discipline described in the famous speech of the Just Reason (5. 961 ff., 986). When Æschylus and Euripides appear in the scene of Aristoph. Thesmophoria (the favor of Dionysus) they agree to base their claims upon their respective merits as teachers of morality (1008, 1055); and Dionysus in proceeding to his final decision proposes to examine them, in order to see which gives the best advice in the crises of life (1430). It is important to emphasize this old view of the poets as teachers, since we are now on the threshold of an age in which a class of professional educators arose styling themselves 'teachers of virtue.' In the eyes of the ordinary man, the chief of these Sophists, who claimed to supplant the poets, was Socrates (Rom. 1491); and, as the result of his and their labors, the teaching of morality was henceforth considered as the proper function of philosophy. (On the subject of this section, see the treatise of Buchholz, Die ästhetische Weltanschauung des Pindaros u. Äschylus, Leipzig, 1889.)

5 Influence of religion upon Greek morality.

In the summary description which has been given of the growth of Greek morality, hardly any portion has been taken of religious influences; and, before we close this chapter, we must briefly examine. At the present day morality is regularly regarded as an established code of precepts and obligations which has been framed to regulate human conduct and rest ultimately upon the authority of a religious sanction. But, inasmuch as their religion, so far at least as it related to the cult of the Olympian deities, did not comprise any such code, the Greeks, in the earlier period of their national development, scarcely recognized any relation between moral and religious life. It is true that there existed a vague and misty belief that wrong-doers were visited with retribution after death; but it was not a doctrine which prevailed among the ordinary man. Even in the popular mind the exceptional transgressors like Tantalus and Ixion, whose offences culminated in the arrogance of their attempts to share the blessings of the immortals. Each god had his appointed sphere (see Eur. Bacch. 302; Headlam on Eurh. Ag. 1067) within which he exercised control; and, though Zeus was supreme over all, even he was subject to the admittance decrees of destiny (Esch. Prom. 555 ff.). The gods were jealous to avenge any infringement of their privileges. But the sinner was punished not as a moral offender, but as a trespasser—and often as an ignoble trespasser—against a visible and actual power. Apart from special circumstances, the general attitude towards the conception of a future life, as may be gathered from the well-known utterance of Achilles, was one of contemptuous indifference: 'Sooner would I be a sea of time poor man who rules over all the sea of the lipless, than over all the spirits of the dead' (Od. xi. 489 ff.). So little concerned was the Greek to extend his vision to the farther side of the grave.

No less unsubstantial was the belief that wickedness is punished in this life. Such a conception is so notoriously contradicted by the facts of daily experience, that the believer in Divine justice is obliged, as we have already seen, to suppose that punishment is sometimes reserved for another generation, and the scoffer is convinced that the gods do not regard the affairs of man. The fact that the investment of the gods with moral attributes was an attempt to reconcile tradition with the needs of an awakening conscience. The primitive gods were not moral agents; they were vindictive and inscrutable potencies, to be conciliated and appeased, if need arose, but hardly to be severely venerated as the unwavering champions of righteousness. The natural result was not to stimulate a desire of improvement or a passion for righteousness, but to quell the promptings of Hope as a principle of hidden regions. This consideration will serve to explain the presence of Hope as one of the evils in Pandora's box (Hes. Op. 96), and the disparaging language applied to Hope in very many passages of Greek literature.

Thus Theogonis (257) puts Hope on a level with Danger, and calls them both ' cruel demons.' Euripides condemned the untrustworthiness of Hope (Suppl. 470), which excites the passions of rivalry and brings one State into conflict with another. And Pindar (Nem. xi. 40) speaks of the limbs of man as fettered by importunate Hope, while the streams of foresight are far distant. (Many other Illustrations are given by L. Schmidt, l. c. 78 ff.; see also Headlam, Cambridge Protections, p. 155.)

The power of hope depends upon the uncertainty of the future. It expresses the efforts of man to escape from his destiny, and points at once to his rashness and to his weakness. It is an invitation to man to step beyond his proper limits, to disregard the rule of temperance, and to seek to be a god. But true wisdom will recognize human impotence, and will counsel resignation to a lot which is inevitable. Hence, to acquiesce in destiny (προσφέρειν μορφαιον), as a mortal to aim at nothing (και το λογαριασμον γενομενον και τον χορφειν 'ακοικιαν ευθυχον) are inculcated again and again. The joyful aspect of Greek religion was embodied in its cults. But the recurring cycle of the city festivals and the greater splendor of the religious gatherings hardly touch the sphere of morality.
In relation to the individual, religious contemplation was pervaded by a spirit of melancholy which may be traced without difficulty from Homer to the latest period. (See S. A. Butcher, Some Aspects of the Greek Genius, London, 1893, pp. 142-176.)

If this was the general effect of religion upon the primitive mind, it is not difficult to find a plentiful crop of evils issuing from the superstitions of the vulgar. Here the old savage beliefs in magic and demons still flourished vigorously, and the superstitions were the victims not only of their own fears, but of all kinds of mendacity imposed upon them by others. The portrait of the superstitious man, as delineated by Theophrastus (Characters, 162, ed. Jebb, 1870), will furnish copious illustration. But in Greece, as elsewhere, superstition only ministered to fear; and, when Greek civilization awakened to a consciousness of its inner development, when the animistic conceptions of their forefathers ceased to satisfy the men of the historic era, and when the creative play of the imagination had hardened the outlines and determined the personalities of the anthropomorphic gods, the religious instinct—craving for something which would rescue man from the futility of life by the terror of an invisible, and assist him in his unceasing struggle towards the light—eagerly welcomed the professions of a purer creed which seemed to promise relief. Such, at least in certain of their aspects, were the tenets of Orphism. Orphism aimed at a purity of thought and act higher than the common standard, and, in order to stimulate the enthusiasm of its adherents, required of them a general asceticism of life, and, in particular, the wearing of white garments, the observance of certain tabus, and abstinence from a flesh diet. Curiously enough, this vegetableism was combined with an initiatory ceremony in honour of Dionysus Zagreus—intended to effect an identification with the Divine nature—at which raw flesh was consumed by the novice (Evfr. fr. 472, 9ff.). The leading notion of the Orphic creed, which cannot now be separated from that of the Pythagorean, was to cleanse the soul from the original sin contracted by its earthly imprisonment in the body. With their consciousness of sin and their systematic attempt to restore the soul to its former purity by the mortification of the body, the Orphics united a belief in metamorphosis and in the purgatorial office of the under world. (The best account of Orphism is in Comper, l. c., 223ff.)

We may say the claims of morality were recognized in the Mysteries (q.v.) of Eleusis. Although we are imperfectly informed as to the details of these ceremonies, there is ample evidence to attest their influence on the religious emotions, and especially the promise offered to their votaries of happiness in the world to come (Soph. fr. 753; Pind. fr. 137). Yet, when every allowance has been made for the influence exercised by mysticism upon Greek society, its diffusion was too partial to leave the character of the community. In the Hippolytus of Euripides, Thessalus appears to adopt the standpoint of the ordinary citizen who inveighs against the Orphics as satisfied and pretentious hypocrites who veiled a vicious disposition beneath a savour exterior (392 ff.). The Eleusins, doubtless, were much less the rallying point of a sect; initiation seems to have been the normal proceeding of an Athenian gentleman; and the privilege was so highly prized that .Hylas and Alectriades had to meet a storm of popular indigation to obtain admission as initiates. Nevertheless, an occasional festival, however venerable and soul-stirring, was necessarily lacking in sustained influence: the celebrants might, indeed, be moved by a transient enthusiasm, but were scarcely conscious of a new direction given to the current of their lives.

6. Beginnings of ethical inquiry. The appearance of ethics was due, not only to the Sophistic movement, and especially to the commanding personality of Socrates (q.v.), but also, to the philosopher's adoption by the Greeks of a moral code rather than custom. Even the moral teaching of Heraclitus (q.v.) and Democritus (q.v.), so far as our records go, consisted of statements and pronouncements, excelling perhaps in subtlety and penetration, but hardly differing in the form of their presentation from the dogmatic utterances of the Seven Sages.

There are several noteworthy sayings among the fragments of Heraclitus, such as "Character is a god to every man" (fr. 119), or "Insolence must be quenched sooner than a configuration" (fr. 43). When he affirms that opinion is "the failing sickness," and that the power of sight is deceitful (fr. 46), we may trace the working of his central doctrine concerning the supremacy of logos.

Much greater in bulk is the amount of sententious moralizing connected with the name of Democritus. We may select the following as the most conclusive specimens:

"Peace of soul (pityia) comes from moderation (mesoptraia) in pleasure and in pain, from the knowledge that righteousness is a mind content and unminded; but the end of unrighteousness is the fear of impending calamity" (fr. 215).

"The test of a man is a man; and similar is the determination of man, found in the results of physical speculations, but they do not profess to rest upon an assured basis of ethical science, and derive such additional weight as may accrue to their intrinsic importance from the personal authority of the teacher who was responsible for them.

The fact is that a moral system could not satisfactorily be constructed unless there had been some accumulated experience of the vagueness and inconsistency of the common moral opinions of mankind; and, when this was done, the moral counsels of every philosopher, however supreme his contempt for the common herd, inevitably shared these defects" (H. Sidgwick in Eths, viii. 579ff.)

Towards the middle of the 5th cent. B.C., the ontological inquiries of the early thinkers had issued in such conflict of opinion that further progress on the lines hitherto followed became impossible. The failure of repeated attempts to read the secret of the universe led to a fever of scepticism which left no shreds of tradition untouched. Nor was it surprising that the failure of the philosophers should spread to the region of morality, and undermine the established rules prescribed by authority. The struggle between the opposing forces was concentrated in the intellectual life of Greece, and in the region of Nature and Convention, where the ambiguity of the term 'Nature' helped to confuse the issue. The advocates of free thought rebelled against settled customs as artificial restraints imposed upon natural freedom.

"Convention," says Hippon in Plut. Prof. 337 D, "is the tyrant of mankind, and often compels us to do many things which are against nature," Archelaus, the pupil of Anaxagoras, declared that all moral distinctions were due to convention and not to nature (Degr. Lecst. ii. 10). Euripides, who was pre-eminently the poet of the new movement, is perhaps the best witness of the extent to which the revolt against customary bonds spread itself in cultivated circles. "The brute of bastardy is no name, for nature levels all" (fr. 165). We have traveled far from Pheidias in fr. 230: "I have but small praise for able birth: the good man be nature's nobleman, but the unrighteous, though his father be higher than Zeus, is naught but a churl." There is not a soul that dares assign a slave to the lord of all: in all else no honest slave is inferior to the free" (Iom, 884).

Sentiments like these appeal to the universal sympathy which is always ready to take the part of the weak. But Nature could be invoked to serve another turn. Callicles in the Gorgias argued that Nature is on the side of the strong, that Might is Right, that the strong man is the best ruler, and that the fetters of Convention and make himself supreme over the weak (452 E ff.). Laws which proclaim the equality of rights are framed in the interest of the weak, to protect them against the
encroachments of the strong. In a similar spirit Thrasymachus in the Republic (388 C E) says that Justice is the advantage of the stronger, and that only the fool willingly obeys the law, since the wise man knows that he may disregard it if he can. The prominence of the word Protagoras' in Plato's dialogue, and the prejudice attaching to Protagoras' profession of his ability to make the weaker cause appear the stronger (Arist. Rhet. ii. 24. 1428, 23), have earned for the Sophists as a class a name which they do not deserve, (see Grote's Hist. of Greece, 1869, ch. lvii.); and H. Sidgwick in JPh iv. (1872) 288). But, apart from this, they naturally attracted the unpopularity which is the usual portion of innovators. The effect of Sophistic teaching upon the average mind may be gauged by a quotation from the anonymous work known as Διαλεκτίς (ii. 18 [Diels, Vorschr. p. 639, 24]):

'Think that if one were to bid all men collect in a heap the several customs which they consider base, and then to withdraw from it those which they hold to be good, nothing would be left, but all would be completely distributed.'

7. Socrates.—It was in such a crisis that Socrates came forward as the founder of Greek ethics. Stung by the very thought, hiserry of men were due to a failure to comprehend the extent of their ignorance, and that his own claim to instruct others was founded not on any greater knowledge, but the belief on the part of himself of any pretensions to know anything at all (Plat. Apol. 23 A), he represented himself as eager to examine, in company with his fellow-learners, the possibility of arriving at knowledge which should have a practical result in conduct. But that, for the time at any rate, the opportunity of making further progress in physical science was excluded by the failure of previous investigators to agree upon a common result in conduct. Holding that, for the time at any rate, the opportunity of making further progress in physical science was excluded by the failure of previous investigators to agree upon a common result in conduct. Holding that, for the time at any rate, the opportunity of making further progress in physical science was excluded by the failure of previous investigators to agree upon a common result in conduct.

8. Knowledge and virtue.—Critics, both ancient and modern, have not failed to remark upon the extraordinary influence which attached to Protagoras' argument in accounting for the will in the Sophistic analysis of moral action; and it has been suggested that Socrates himself exercised so complete a control over his own impulses that he was led to ignore the important results which flowed from the failure of will-power in others. There may be some measure of truth in this, but it is far more important to observe that the Greeks never at any time succeeded in drawing a clear line between the intellectual and the moral qualities, and that the notion of morality was always rather a concern of the head than of the heart.

...Eucharis described insensate folly as causing the sin of Lais (Theb. 769); Hermes warned the Oecides not to be led by folly into disobedience to the will of Zeus (Prom. 1113); and Iphicles was the name cause of the bloodshed at Troy (Ag. 1456). So in Soph. Ant. 609, 'Wisdom, more than any other thing, has been destroyed by the folly of speech and freeness of the mind. These examples, taken almost at random, might be multiplied indefinitely; but the tendency is summarized in a fragment of Sophocles (859), 'Folly is most nearly akin to depravity.' It has left its mark on the vocabulary not merely in the moral connotation of such words as ἀθρός, σκαλις, and ἠλθέων, but in the more general use of ἀθρόφορος, ἀθρόμορφος, and the rest. It must also be remembered that ἀθρός itself was not entirely a moral quality like our 'virtue,' but included the other gifts and capacities which sustain and enrich life (see also Gomperz, ii. 65 E).

The subsequent development of moral philosophy in Greece was so far determined by the influence of Socrates that the various schools founded by his immediate pupils all professed to continue the teaching of the master. The school of the Cynics, which afterwards followed in the current. Until Christianity set up a new ideal, Socrates continued to be the pattern of moral perfection to the pagan world (M. Anton. i. 10).

9. The Cynicism.—The founder of this school was Antisthenes, who is said to have attached himself to Socrates, after a life of hardship, at a later age than was usual (Plat. Soph. 291 B). In the school which he established after the death of his master, he emphasized the Socratic principle of the supreme importance of knowledge, by a searching criticism of the ideals of the average citizen. Thus he denounced the false notions which are implicit in the popular estimation of riches, honour, and power. Antisthenes even went so far as to deprecate the patriotic ideals of his fellow-citizens, by declaring that the national victories in the Persian wars were of no great account, because known by the instability of the results obtained. But his severest condemnation was reserved for pleasure. 'May I be mad sooner than glad;' (Anl. Gell. ix. 5. 3). 'If I could lay hands on Aprodite, I would shoot her' (Clem. Alex. Strom. vii. 486). The real sentiment is an illusion (ὑποθέσεως), and the wise man must cultivate complete freedom from such illusions (εὐγνώμονα). In order to reach this security he must fix his regard entirely upon the requirements of Nature, and distrust everything which is sanctioned only by convention. For this purpose he must be self-sufficient (αὐτοψυχως), and must train himself to acquire the 'Socratic strength,' the complete self-control which springs from the wisdom of a master mind. The Cynic chose Heracles as his patron saint (Zeller, p. 306, n. 4), glorifying his labours as victories won against cruelty and lust: and loved to contrast him with his predecessors, who had brutalized mankind with the delusive promise of an injurious civilization (Gomperz, ii. 145, 161). It soon became evident that the requirements of a life 'according to Nature' were incompatible with the habits of ordinary society. The Cynic deliberately adopted the life of a beggar. He wore his beard long and unshorn, dressed himself in a rough coarse cloak, and carried a wallet and a staff.

The leader in this movement of practical asceticism was Diogenes of Sinope, who ultimately settled at Corinth, and to whose name a number of witty sayings were attached by later writers. Cynicism
ETHICS AND MORALITY (Greek)

has been termed the philosophy of the Greek proletariat, and, by mixing with the masses and striving to instil their minds with saving knowledge, the Cynics passed on to us the teachings of early Middle Ages. The power of the movement is shown by the fact that it lasted until at least A.D. 400. Diogenes scornfully adopted as a title of honour the word 'Cynic', who had been applied to him in contempt. His life was directed especially to prove that the ordinary standards of value are based upon illusion. What the many esteem as goods are impediments to the attainment of happiness. Only when a man has learnt that sickness, death, and dishonour cannot impair his peace of mind is he able to grasp the absolute indifference (άδιάφορα) of external goods. But the Cynics were not content to be philosophical anarchists. Their writings advocated a new Utopia founded upon the abolition of all privileges, political and social, and of all distinctions between one nation and another, even of that which to the Greek was fundamental—the distinction between Greeks and barbarians. Diogenes proclaimed himself a citizen of the world. The extremes to which they were prepared to go in combating the prejudices of society—as they defended poverty, idleness, and cannibalism as natural—are responsible for the degradation of the word 'cynic' in modern usage. But the social communism which led Diogenes to advocate a community of wives and children was no more reprehensible in him than in Plato; and the spirit of the paradoxes by which he startled his hearers was no doubt often misunderstood and misrepresented.

An excellent estimate of the strength and weakness of Cynicism is given by Gomperz, ii. 100 ff.; see also art. CYNICS.

10. The Megarians (q.v.), a school founded by Eudemus, are chiefly important to the student of philosophy as the earliest of the Sceptics, who from this time forward, under various leaders, attacked the conclusions of the dogmatic schools; but as to their views in the department of Ethics we hardly any information. All that can be said is, that Eudemus, starting from the Socratic position that the good is the highest object of knowledge, proceeded to identify it with the Eleatic Being, and to declare that Good is a Unity, whereas of God, Mind, and Prudence are but different names. Further, since Good comprehends all existence, Evil, the opposite of good, is non-existent (Diog. Laert. ii. 106). In his attempt to unite Eleaticism with Socraticism, Eudemus reminds us of a modern writer who sought to blend his master's teaching elements derived from Heraclitus and Pythagoras.

11. The Cyrenaics.—Aristippus of Cyrene was the earliest apostle of hedonism. From the Socratic identification of the good with the useful, and his limitation of knowledge to the discovery of the proper end of action, Aristippus deduced that every virtuous action aims at pleasure. The analogy of the irrational impulses of children and animals, who continually strive after pleasure or seek to avoid pain, pointed to this process as a fundamental condition in the operation of Nature. Further, he held that all knowledge is relative to the subject, since we have no knowledge of things in themselves, but only so far as they affect our feelings. Consequently, we can only aim at producing what is gratifying to ourselves. He defined pleasure as a gentle movement, distinguishing it from pain on the one hand, and absence of pain on the other. The pleasure to be pursued is not to be aimed at, as most men say, but the sum of all pleasures, activities, although happiness might be the particular, but rather in the particular pleasure of the present moment (μυπήγωνον ἔννοιαν). The past and the future are alike indifferent; only the present is ours to enjoy. Since every pleasure, qua pleasure, is good, there is no difference between them; and there is no such thing as a disgraceful pleasure, pleasure being by definition an end approved by the will of man, and the consequence of the actions of man. Wisdom, in short, is required as a means to an end—the selection of the greatest good; for, though external circumstances press too hardly to permit the enjoyment of unbroken pleasure, he will live a life of pleasure, if he be fitted to the mean be passed in pleasure, that of the fool in pain (Diog. Laert. ii. 91).

The anecdotes which are related concerning the life of Aristippus, his alternate subservience and indifference to Dionysius the tyrant, his enjoyment of and contempt for wealth, and the importance which he ascribed to intellectual freedom and self-control (Zeller, 852 f.), illustrate the ideal of cautious cheerfulness and moderation to which he aspired. 'I endeavour,' says Horace, speaking in the person of Aristippus, 'to make things submit to my control, not to submit myself to them' (Epist. i. 32). No form of conduct, situation, or occupation, was so alien to his lofty aims, as yet equal to every present need (Epist. i. 17, 25; cf. Diog. Laert. ii. 66). The wealth of the Cynic was a means to an end, not an end in itself; and, as an end, was as much to be shunned as to be possessed (Diog. Laert. ii. 75), referred primarily to his connexion of the idea of a life that is fitted to the mean with the general attitude of Aristippus towards the emotions.

It is worth while to mention that one of the developments of Cyrenaic ethics took the direction of Pessimism. The impossibility for the great majority of mankind of attaining pleasure, and the consequent worthlessness of life, were most strongly asserted by Hegesias, who earned his title 'advocate of death' by his treatise on suicide (Diog. Laert. ii. 86). He argued that the best thing to which we can attain is freedom from pain, and that this is most fully realized by death (ib. 94; cf. also art. CYRENAICS).

12. Plato.—Of all the pupils of Socrates, Plato (q.v.) was the most fully endowed with his master's spirit, and must be accounted the true heir of the succession to his doctrine. By way of contrast with Plato, the philosophers previously discussed have been called the imperfect Socrates. The influence of Plato upon subsequent generations has been extraordinary (Gic. Tusc. i. 79; ad Att. iv. 16.3), but has been due at least as much to the charm of his surpassing literary genius as to the characteristic of his philosophical speculations. Plato's philosophical views were presented in a series of dialogues, in which the professed object of investigation often appears not to have been attained, and other ends, which his master had purposely introduced incidentally, only to be dismissed unsolved. The coherence and development of his system have in consequence given rise to protracted discussion. Fortunately, however, these difficulties are less urgent in the sphere of ethics than in that of ontology. Plato started from the Socratic position that virtue must be acquired through knowledge; but, in the investigation of the conditions upon which the acquisition of knowledge depends, he passed far beyond the Socratic limits. He derived from previous philosophers the conviction that sense-perception of the phenomenal world is thoroughly fallacious, and the apprehension of actual existence, Socrates, leaving all such difficulties on one side, had contented himself with affirming that whatever knowledge we have, the general conception underlying individual instances, which we do not wish to express by definition; but Plato made the general conception a Reality, something existing in and for itself, at once comprehending and transcending the particular instances we know our senses. Further, he was able to identify existence with good, on the ground that each thing exists only so far as it performs its par-
ticular good. True knowledge can proceed only from contact with the supreme entities (δεῖα; or "categorical" judgments) with the world of appearances comes into being or seems to be.

To bridge the gap between apparent and real existence is the lifelong task of the philosopher; and this in no small degree is the true virtue of the philosopher (Phaedo, 82 B; Meno, 100 A). The former may be accomplished by the successful statesman through habituation or by some Divine dispensation (δόξα), but the latter can be reached only by the arduous path of inquiry into the true nature of absolute virtue. The effect of this rejection of the sensible world as the field for knowledge was to drive the philosopher to the contemplation of the immaterial ideas. He must turn aside from the phenomenal and seek refuge in the Divine; his whole life must be a preparation for death, a purification of his soul from the delusions that are mingled with the body (Phaedo, 64f). This element of mysticism seems to have been derived from Pythagorean sources, just as the ascetic attitude towards phenomena was suggested by the conclusions of Heraclitus, Parmenides, and Xenophanes.

An important part of Plato's ethics can be understood only in connexion with his psychology. As the soul existed before, and will continue to exist after, its period of incarnation in the body, it must contain within it an element akin to the eternal essence of the ideas, at the head of which is placed the idea of the Good (Rep. 611 B, with Adam's discussion, i. 170). On the other hand, it is clearly accessible to earthly influences, and its deterioration must be attributed to the growth of those tendencies which depress its higher aspirations and strengthen its material bonds (Rep. 611). From these conditions Plato deduced his doctrine of the tripartite soul. The part which is akin to real existence is known as the ruling part, and as informed with reason (γνώμονας, λογιστικός); opposite to it are the two parts which are the seats of the emotions, the one of the nobler promptings of anger (θυμωνίας), and the other of the lower cravings of sensual desire (πεποθωμονίας). How Plato was able to reconcile this triple division without a question of a questionable division which need not be discussed here. The exposition of the character of virtue rests upon his psychology. Each part of the soul has its own appropriate excellence, or virtue, and, according to their various dispositions, men tend to excel in this or that direction. In this way Plato arrived at his doctrine of the four cardinal virtues. As Wisdom corresponds to the rational (λογιστικόν) part, so does Courage to the spiritual (θυμικόν), and Temperance to the appetitive (έπιθυμωνίας). But the exercise of the moderating power of reason over the other two parts, compelling them to subordinate themselves to its guidance, is assigned to the fourth virtue, Justice (δικαιοσύνη). It should be observed that Plato is here using Justice in the wider sense, which common opinion warranted (Adam on Rep. 331 E), of general righteousness in relation to which part of man to his neighbour, which was immediately limited by the requirements of particular values. But Plato would hardly have given to it such a prominent place in the analysis of the individual soul, if it were not with the same view that the welfare of the soul was conceived as analogous to the mutual relations of the three classes in the ideal community; and civic justice was the fulfilment by each separate class of its duty to observe the limits prescribed to its activities.

The Highest Good must be found in the complete development of the soul in its proper function of communion with objects of thought. He has already said that a soul is esteemed happy either in this phase of existence or after death. It is obvious that Plato had moved far from the simple utilitarianism of Socrates. But it is extremely difficult to define Plato's attitude towards the idea of happiness, which is variously expressed in different dialogues. Whereas in the Protagoras (351 A) he seems to identify Pleasure and Good, in the Gorgias (497 A) and the Republic (509 B) he declares that the two are entirely distinct. Finally, in the Philolaus, although he denies that Pleasure is the Chief Good, and asserts that in the scale of goods Intelligence and Reason stand far above Pleasure, nevertheless it is admitted that a life without pleasure (or pain) is not to be chosen (21 D, 63 E), and the pure and harmless pleasures of the senses are allowed to possess a certain degree of value (66 C).

15. Aristotle — The doctrine of Aristotle (q.c.) should be regarded as the complement of Platonic speculation. Their differences are less important than the particulars in which they agree, although the former are made the more prominent by the difference of method and style. Aristotle formulates and defines conclusions which are implicit in Plato's writings, and, by correcting the relative values to be assigned to certain views which occupy a part of the common field of investigation, he appears to be more in opposition than he really is. Thus, in his treatment of the Socratic ground-work, Aristotle definitely draws the distinction between speculative and practical wisdom (επιστήμη and σοφία) towards which Plato was working in contrasting civil with philosophic virtue. But, whereas Plato employed all the energy at his command in urging the paramount claims of philosophy, Aristotle admitted the supremacy of the theoretic life (Eth. Nic. x. 7) as an end in itself, and as an approximation to the Divine through the activity of reason, but concluded that the proper exercise of man is to be found in the moral virtues which belong to a practical life.

The Highest Good, or ultimate aim, of all action is to be found in Happiness (εὐτυχία), or to adopt a more accurate equivalent—in well-being. Neither pleasure nor external goods can be identified with Happiness, which can be attained only by rational activity. This activity properly performed is Virtue (Eth. Nic. i. 6). Happiness, however, is not to be predicated of single acts, but is commensurate with life taken as a whole, and requires a certain supply of external advantages. No one could call himself happy, if friendship, health, noble birth, and beauty are all elements which cannot be disregarded in making an estimate of complete happiness. In the same way Aristotle deals with the claims of Pleasure. While fully conscious that it cannot be weighed in the scale against virtue, and that, if it becomes necessary to make a choice between suffering and the abandonment of virtue, every hardship must be borne on behalf of the latter, he relates to natural pleasures as something indifferent or negligible. On the contrary, he maintains that it is the necessary concomitant of every activity (ib. x. 4), and that the purest and best pleasures are those arising from the use of the higher intellectual virtues. The pursuit of pleasure is natural and not to be condemned (ib. x. 2, vii. 13). Nevertheless, pleasure and external goods are valuable only
in relation to virtuous activities (§ 8, i. 8), whether intellectual (δυναμική) or moral (φύσιν).

Moral virtue is a permanent condition (§ 44) of the soul (§ 8, ii. 4), as distinguished from an emotion (πάθος) or a passion (τύμπανον). Virtue is not innate but acquired by practice, not involuntary but dependent on a definite exercise of the will. Again, a virtuous action implies a virtuous agent; unless it is preceded by a right motive, and is such that a virtuous man would perform, no action can properly be described as virtuous (§ 3, v 13).

Virtue requires the presence of certain natural qualities, i.e. we are born with a capacity for moral activity (§ 8, vi. 13). But these are not enough in themselves: otherwise children or animals might possess virtue. Virtue is impossible without insight (φιλοσοφία); but knowledge and virtue are not identical, as Socrates thought. Socrates ignored the irrational part of the soul, and the effect of emotion upon conduct. Virtue implies the free exercise of the will in controlling or yielding to impulses and is rooted in habit. The repeated performance of moral actions makes them a part of the agent—i.e. in the narrower sense as the virtue which aims at equality—is examined at length in Book v. Book vi. is devoted to the treatment of Insight (φιλοσοφία), the virtue of practical reason, which is carefully distinguished from ευγνωσία, σοφία, and the rest. This is not the place to enter into the details of the analysis, but it should be observed that Aristotle regards ethics as an abstract science than as an opportunity for recording the results of his own observation in the sphere of contemporary morality. The general principles reached by this method of induction cannot be so exactly systematized as to fit the varying circumstances of everyday life. Just as a lawyer will refuse to rely upon a broad generalization, by saying that each case must be judged on its own facts, so the philosopher should exercise the reciprocal relations of insight and moral virtue to be determined on the experienced judgment of the practical moralist.

14. The Hellenistic age. There can be no question that the period which closed with the death of Aristotle was one of marked decay in public virtue. After the disastrous issues of the Peloponnesian war, Athens was never again more than a shadow of her former self. She was still to produce eminent citizens, but the imperial spirit was broken. The venality of her politicians, and the failure of her citizens to make an adequate response to the calls of military and other public services, were continually on the increase. If we make allowance for the universal tendency to idealize the past, there was still sufficient reason for Isocrates to complain (vii. 48) of the increasing idleness and profligacy of the young men, of the workmen, and of the herdsmen. The usual tendency to esteem wit and cleverness more highly than the more solid civic virtues. Sparta, again, had failed conspicuously to realize the opportunities afforded by its political structure. Her whole system was marked by so much cruelty, stupidity, and avarice that she quickly aroused a general opposition to her ascendency, which never recovered from the shock given to her military power at Leuctra. If Thebes seemed for a season to have revived the ancient Hellenic fire, it proved to be only a temporary flash, quickly extinguished by the death of the hero Leonidas. In fact, the conditions under which the city communities had flourished were rapidly passing away. The time had come for the establishment of a wider dominion, and in the person of Philip of Macedon the destined conqueror appeared. His successor Alexander was not so much the establishment of a universal empire as the opening out of every part of the known world to the spread of Greek thought and Greek civilization. Thus, in the words of Plutarch (Mor. 329 A), he realized the dream of Zeno the Stoic, that all men should live as members of a single community, since Alexander, by mixing, as in a loving-cup, the lives and characters of all men, had required of them that they should consider the world as their native country. Henceforward the distinctive characteristics of the Greek communities were merged in a general uniformity of life; and the more practical custom at Athens was not widely different from that of Pergamum or Alexandria. The decay of civil interests led to the withdrawal of serious and intelligent attention to the more serious questions of philosophy, and so fostered the growth of the inner conscience, which is reflected in the teaching of the Stoics and Epicureans.

So far as the morality of the individual is concerned, it is difficult to make a comparison with the earlier era. But the pictures of ordinary life which are presented to us in the plays of the New Comedy—as known to us until quite recently only through the Latin adaptations of Plautus and Terence—are not of an attractive character. The society depicted is narrow and mean, and there is hardly a trace of elevated feeling or generous ambition. The tricks of a cunning slave, and the outwitting of a strait-laced father or a rashly pander were the common stock-in-trade of every dramatist. ‘Idleness, frivolity, luxury, self-indulgence, are the attributes of the society which went to see its own reflection upon the stage’ (Mahaffy, Greek Life and Thought, p. 137). The extent of the decay in public spirit which had set in since the great period of Athenian expansion may be gauged by contrasting—to take a trivial illustration—the caricature of Lamachus in the Acharnians with the military bragadocio of the New Comedy, or the speeches of Pericles in Thucydides with the servile compositions which bestowed Pindaric and Alexandrian Decorum on Demetrius Poliorcetes (Poetæ Lyrici Graeci, ed. Bergk, Leipzig, 1882, ii. 674). Even the chief ornament of Alexandrian literature, the development of the Theocritean idyll, has been referred, like the case of Boussan in the 18th cent., to a reactionary movement seeking to find relief in the freshness of Nature, from the depravity of contemporary society (see Ziegler, 142). But the importance of this evidence must not be exaggerated by omitting certain items on the other side of the account which deserve consideration. Thus, if the characteristic traits of the period showed less vigour, they had lost much of the earlier harshness. The increase of enlightenment brought with it a more widely diffused humanity. The most important sign of progress was the growing influence of philosophy upon daily life. The Sophists, who, which was sufficient for old-fashioned people at the end of the 6th cent., had ceased, after the lapse of a hundred years, to satisfy the needs of their descendants. To attend philosophical lectures, which was a fashionable passe-temps for ‘up-to-date’ people of the time of the Sophists, had become the established practice. Philosophers, instead of being prosecuted
for impiety, 1) were considered worthy of the highest honours by which the State could bestow. In the next generation we have the hononific decree in favour of Zeno the Stoic, the intimate friendship of Plato with Cleanthes, the political missions of Xenocrates to Antipater and of Crates to Demetrius.

Philosophy was no longer regarded merely as an eloquent instrument, or even as an amusement leading to knowledge. The schools of Plato and Aristotle became permanent institutions localized at the Academy and the Lyceum, and organized so as to encourage a spirit of corporate enthusiasm among their members. For the decadation of politics, as has already been mentioned, had driven those who were sufficiently serious to be dissatisfied with the frivolity of ordinary life, and were not preoccupied with mental industry or military service abroad, to take refuge in the disputations of the schools. But, in spite of the fame of their founders and the influence which they were destined to exercise over medieval and modern thought, neither the Platonists (ib. 4), reason, which originated exactly what the generation required. The lofty idealism of Plato and the minute and accurate science of Aristotle were alike unsuited to the need which existed amidst the sinster influences of a corrupt society. In other words, philosophy was expected to supply what religion was then incapable of affording. Herein lay the opportunity which the new schools of Zeno and Epicurus were not slow to seize. Both Stoics and Epicureans made practical ethics the ultimate end to which their physical and logical speculations were directed; they aspired to discover truth in order to throw open the way to happiness.

15. The Stoics.—Zeno, a native of Citium in Cyprus, who had studied under Xenocrates and Polemo the Academicians and Crates the Cynic, established a separate school at Athens in the closing years of the 4th century. Under his successors, Cleantus (q.v.) and Chrysippus (q.v.), the distinctive doctrines of the Stoics, so called from the Stoai Poikile, where Zeno had lectured, were developed and defined; and during the following centuries, through which it continued to flourish, the leaders of the school, without abandoning the dogmatic spirit, improved and secured for their rivals in accommodating their teaching to the needs and aspirations of the time. Although Zeno and his immediate successors devoted an immense amount of labour to the study of logic and physics, the supreme importance of ethics was recognized at an early date (Stoic. Vet. Frgmr., ed. von Arnim, iii. Leipzig, 1903, 68), and, as time went on, it tended more and more to be the sole subject of general interest. The ultimate end of moral action was, according to the Stoics, a life in agreement with Nature, whereby they understood a conformity with the workings of Reason as immanent both in the individual and in the universe (ib. 4). Reason, which is the Universal Law, is identified with Zeus, and happiness is attained when the individual reason is made to submit itself to the will of the Supreme Governor of the universe (ib. 18). Life in accordance with Nature is identical with a perfect life, and the perfection of anything is the same as its virtue (ib. 16). Thus virtue is the only thing which should be chosen for its own sake (ib. 39), and is by itself sufficient for happiness (ib. 54). The Good was interpreted, as by Socrates, as equivalent to advantage (ib. 75), and it was obvious that virtue alone would furnish true profit, and that vice alone could harm (ib. 75, 76). It follows that everything except virtue and vice—health, riches, fame, beauty, even life itself—is absolutely indifferent. So far Zeno is in accord with the Cynics; but he refused to draw the same inference from the premises. Things indifferent are capable of being used either well or ill, and are not all indifferent to the same extent. In other words, thing indifferent may have a certain value, positive or negative (διότι, ἀρετῶς), as contributing towards a life in accordance with Nature or as hindering its development (ib. 126). But there are certain things which have so much value that, in the absence of over-riding circums- stances, they will always be chosen in preference to their contraries. Such things are natural ability, life, riches, fame, and so forth, and they are consequently described as being preferred (προσωπεύονται), whereas their opposites are to be rejected (ἀποστροφοῦνται [ib. 31]). Such advantages, however, will weigh as nothing in the scale against virtue; and, if it becomes necessary to make a choice, we must face death sooner than be guilty of vice (ib. 168). All moral action arises from impulse (δύναμις), that is to say, the movement of the soul directed towards the acquisition of some external object. Right and wrong are determined by reason; but, where reason does not exist or is not fully developed, as in the case of children and animals, the natural impulses are primarily directed towards self-preservation, and not, as the Epicureans believed, towards pleasure (ib. 178). The objects thus sought after (τὰ πρὸς καλὸν φέουσα) serve as an introduction to the subsequent action of wisdom, which is exercised in the separation of the natural from the irrational and the rational selection of the former (ib. 186, 190).

The impulses given by Nature are directed to the right objects, but the reason may be distracted by the seductions of pleasure or the urgency of associates (ib. 228). Nevertheless, virtue can be taught, as experience proves (ib. 223). The Socratic view that Virtue is Knowledge is still maintained; but the Stoics, who held that nothing but body existed, were obliged to argue that the virtues also were corporeal, being, in fact, a particular disposition of the soul itself (ib. 305). Virtue is thus both one and many—one in so far as it is something; both for all and in relation to the sphere of its activities. Thus Insight is the knowledge of what to do and what not to do, Temperance the knowledge of what to choose and what to avoid, Justice is that knowledge which gives every man his due, and Courage that which can distinguish the proper objects of fear (ib. 292). The virtues are reciprocally connected with each other, and he who has one necessarily possesses all; nor can he act in the exercise of a single virtue without at the same time employing the others (ib. 299). Virtue, being based upon secure convictions, was so completely identified with a man's moral nature that some of the Stoics identified themselves with it (ib. 237). The ordinary man (φύσις), however, fails to exercise his reason properly. He is the slave of emotion (φρονησία), which may be desired more than anything else (ib. 379); or again as perverted judgment (ib. 456). The Stoics spent much labour in distinguishing the varieties of emotion, grouping them round the four chief classes of instrumental feeling: two of which, Pleasure and Pain, are concerned with the present, and the others, Desire and Fear, with the future (ib. 391). It will be seen that emotion is a disordered condition of the reason itself; we have no longer, as in Plato

---

1) The last echoes of the older thunder were the decrees for the expulsion of persons of foreign birth from Athens of 316, which was re-
and Aristotle, to think of two rival powers striving for the mastery, but rather of a revolt against the rightful authority. It follows that emotion must be absolutely suppressed, since everything that is contrary to right reason is sinful (ib. 445, 446).

The Stoics drew up a classification of actions so as to correspond with the distinction between Virtue as the Absolute Good and things indiferent but yet valuable. Proceeding from this, the two kinds of virtue are Right Actions (καθόπωςdaemon), vicious actions are Sins (ἀμαρτίας). These classes comprise every act of the wise man on the one hand, and of the fool on the other. Hence the paradox that all sins are equal; for no difference in degree is conceivable (ib. 527, 528). But, if we look not at the agent, but at the act in relation to its object, we must distinguish between the fit and the unfit, capable (κάθεν) and its opposite. A perfectly fitting action (τρεῖον καθόπως), such as to act justly, may be identified with Right Action. Otherwise, fitting actions are such as may be justified on grounds of probability (διὰ προχρήσεως καθλοκοτίνακα). In ethics, we must take care of one's health (ib. 134 f.).

The actual embodiment of the Stoic conception of Virtue is to be seen in their picture of the Wise Man. The virtues of the wise man never make a mistake, never opinie, never changes his mind. He is an expert on every subject, being endowed with every excellence. His body may be in pain, but he never suffers; though he were as unfortunate as Priam, he would still be happy. None but the wise can lay claim to riches, beauty, or freedom; for no one has possessions so valuable, no one is so deserving of love as the wise. The wise man is the only true prophet, priest, and king. True friendship can exist only between the wise, for they alone can benefit each other: 'If a single wise man anywhere extends his finger with a wise purpose, all the wise men in the world are benefited' (ib. 627). The wise man bears no trace of softness; he is unmoved by passion; he never pardons, never pityes, and is never surprised. It is not to be wondered at that this doctrine involved the Stoics in controversial difficulties, or that Chrysippus was forced to admit that the wise man was a rarer portent than the phohnix (see E. D. u. E. Weisse Stoicorum, Cambridge, 1911, p. 298, and cf. art. STOICISM).

16. Epicurus.—The school of Epicurus (see art. EPICUREANS), first established at Mytilene and subsequently removed to Lampaeus, was transferred to Athens in 306. The system was in all essentials the work of the founder, and was faithfully guarded by his successors, remaining practically unchanged so long as the school continued to exist. Epicurus asserted emphatically that the object of all philosophical inquiry is the attainment of happiness by the individual, and that knowledge or virtue has any worth in itself. Thus, his exposition of the true nature of the good, as absolutely indifferent to human affairs, was intended to remove superstitious fears, which are among the most serious obstacles to human happiness. Similarly, by his inquiry into the essence of pain it is shown that it can neither be immortal, he hoped to destroy entirely the fear of death. He laid the groundwork of his ethics by a psychological examination of the whole mind. The highest grade of pleasure is attained when every painful need is removed, and every natural craving stilled. The condition thus attained is one of complete rest (καταστάσις ἐκ σκέψεως), and must be contrasted with the pleasure which consists in the satisfaction of a want (ἀποκορούν ἐν κινήτου). The latter is necessarily mingled with discomfort, unless it is merely connected with a variation (πατελομίδος) of the highest good. Wants were accordingly classified as (1) natural and necessary, (2) natural and not necessary, (3) neither natural nor necessary. The second class was not subject to the incalculable pleasure, passion, except when men are misled by a false opinion that the highest good is capable of increase. The third class are products of the imagination, and must be totally rejected (fr. 490-493 [Usener]).

Epicurus differed from the Cyrenaics in three respects: (1) he declared freedom from pain, which the Cyrenaics did not count as a pleasure at all, to be the greatest of all pleasures; (2) he declared that all pleasures of the mind are ultimately referable to and derived from bodily pleasures, whereas the Cyrenaics held that the pleasure of intercourse with friends or the gratification arising from honour is independent of sensation; (3) pleasures of the mind refer to the past and future as well as to the present, and, as being more durable, are greater than immediate bodily pleasures. Moreover, these principles are those of undiluted hedonism. Experience shows that pleasure and pain are the only motives which control our actions. The attainment of happiness is the object of our actions, and the natural criteria by which the value of our impulses and activities is measured. Reason is a later accession, which does not alter the ultimate aim, but points out the means of attaining it.

Reason teaches us to look not to immediate enjoyment, but to the remoter consequences of our actions. Every pleasure is a good in itself, as being suitable to our nature (αἰτιοῦτον), but it is not every pleasure that is an object of pursuit (ἀπολογεῖσθαι). Conversely, certain pains are comparatively so important that we must accept them, if on the balance of the account they appear to bring with them a larger amount of pleasure.

The value of the virtues is to be found in the fact that without them we cannot reach the highest good—absence of all pain and of every fear of future disturbance. Insight (προφησία) is the root of all the other virtues: it sets us free from false opinion, and puts before us the true goal of our endeavour. Self-control (ἐγκρατεία) imparts the necessary resolution to adhere to the decisions of the judge. Lastly, we reach peace by mastering the cause of pleasure and as little pain as are possible for us; and courage prevents our peace of mind from being destroyed; by fear of death, superstition, or pain. Lastly, the violation of justice is incompatible with an agreeable life. For the unjust man, even though his misdeeds are concealed, is continually anxious lest they should be discovered. On the other hand, upright conduct contributes to our enjoyment, by earning the good-will and affection of our fellow-men. On the value of friendship the Epicureans laid great stress: it was grounded ultimately upon mutual advantage, but the happiness of the individual was conceived to reach its highest pitch in the unsullied enjoyment of the wise and virtuous (fr. 544). In other respects, Epicurus assigned very little value to the conditions of civil society. Laws would not be needed, for human nature was such as to make every voluntary action sufficient to protect the wise from injustice (fr. 536). He recommended abstinence from politics on the ground that public life interferes with happiness (ὑπάρχου ἐπιστῆμα). Lastly, he deprecated arranged marriage as likely to lead to much trouble (fr. 525). The result of Epicurean hedonism is not far removed from the Stoic ideal: the happiness of the Epicurean wise man is no less founded on the secure possession of insight, and is so entirely independent of external circumstances that it
endures while its possessor is suffering physical torture. (Ir. 9.)

17. The Greco-Roman age.—In the sketch that has already been given of Stoic ethics, little or nothing has been said of the adaptation of Stoic principles to the needs of daily life. But the influence and vitality of the philosophy, as we have seen, was nothing more clearly than by their success in procuring the adhesion of the system of so large an element of Roman society (for the details, see E. V. Arnold, _Stoics_, 2 vols., 1889, p. 170), and were shown by the modifications made by Panaitius. Stoicism, as it was opened out to the practical Romans, became less a subject of study for the curious than a religious creed to which every serious man might look for support. Its success in this direction was undoubtedly promoted by the attitude which had been adopted towards the popular religion. By an elaborate series of allegorical explanations the Stoics sought to accommodate their pantheistical belief in the universal immanence of the Divine Reason to the existence of the separate personalities represented in popular theology. Hecules was fire, Rhea earth, Zeus father, and so forth. Thus, as a benevolent and all-powerful god, and to an advantage gained which neither the agnosticism of the New Academy nor the outspoken hostility of Epicurus to the orthodox religion was able to provoke. The history of the Stoas after Panaitius shows a continually diminishing sympathy in philosophy and an increasing strength in moral exhortation. Seneca (q.v.), for instance, laid much stress on the healing powers of philosophy for all who were mentally sick. He prescribed rules for those who were in various stages of progress (προςωπὴ) towards wisdom; for the removal of vicious habits; for the training of the impulses; for the mastery of the passions: and for the strengthening of the will. The restraint of civil liberty under the Empire imparted a gloomy tone to the discourse of the philosophic preacher. The doctrine of 'a reasonable departure' (εκφορος ξεγεργή) — by which the earlier Stoics had contemned suicide as an escape from intolerable evils, thereby emphasizing the moral indifference of life and death — was repeated by Seneca with morbid insistence. Musonius and Epictetus admit into their writings even less philosophical discussion than Seneca. Epictetus (q.v.) in particular was the preacher of a pure and gentle morality which often approximates to Christian doctrine. His famous maxim, 'Suffer and be saved,' shows the extent of his belief in the benevolent Providence; and he never fails to recommend the duty of submission to outward events which are not within our power. The same spirit of pious resignation appears in Marcus Aurelius (q.v.), the last of the Stoics; the proud independence of the sage had given way before the human sense of helplessness; the soul was hampered by the prison-house of the body, and found life to be a sojourn in a strange land. Thus in its last moments Stoicism came near to Platonism.

Of the four post-Aristotelian schools, neither the Epicurean nor the Poropatetic made any progress, of sufficient importance to be recorded here, beyond the views of their founders. But the Academy had a more chequered history, to which we must briefly refer. The New Academy under Aracitas and Carneades was preceded by its determined scepticism from admitting the possibility of scientific ethics; but on the basis of probability they gave a general adherence to Platonie teaching. Later, Antiochus of Ascalon, Cicero's teacher, endeavoured to effect a reconciliation of the doctrines of Epicurus and those of Stoicism, but his influence soon exhausted itself. In the 1st cent. B.C. there was a notable emergence of mystical asceticism, associated with a revival of Pythagoreanism. Its general tendency was to reduce the purity of soul attained by a special restriction of the bodily appetites to the only proper channel whereby the devotee could acquire a knowledge of the Divine mysteries (see Mahaffy, Greek World under Roman sway, London, 1890, p. 174). A revival of the doctrines of Pythagoras, Platonism, and the traces of its working may be found in the moral treatises of Plutarck (q.v.). According to him, the structure of morality is built upon the foundation of the religious. Virtue is identified with the assimilation to the latter and the Highest Good is the knowledge of God (Aristit. 6). Thus its attitude towards religion was conservative; he defended divination, maintained the doctrine of metempsychosis, and believed in the power of demons and spirits to control human action by their interference. To avoid the defilements of sense, and to cultivate the reason as the indwelling source of Divine inspiration, were the supreme duties of man (see de gen. Soc. 20, p. 388 E. E.). But the culmination of this mystical tendency was realized in Neo-Platonism (q.v.); and Plotinus, who was its chief representative, has been acclaimed justly regarding the last, last of the Antiquity. In conformity with Plato, who had denounced the untrustworthiness of sense-impression, Plotinus identified matter with evil, and made purification from the contaminations of sense, withdrawal from the body, and the retreat of the soul from its enslavement to the body, the fundamental requirements of his ethical teaching. The ordinary civil virtues are of no value, since they tend to blind the soul to the world of matter. The soul must approach God by re-absorption into the Intelligence (Sophos) from which it sprang. This process must be encouraged by contemplation and the love of the Beautiful (the Platonie Eros) helps to direct us from the impressions of sense to the ideal world. Constant association with the ideas may lead ultimately to the condition of supreme bliss, when the soul in a moment of ecstasy finds itself by contact with the Divine Unity identified with God Himself.

LITERATURE.—Several of the authorities have been mentioned incidentally, but the chief sources of information are the History of Greek Philosophy, and more particularly E. Zeller, _Phila. d. Griechen_ in ihrer geschichtl. Entwicklung, Leipzig, 1892 (the greater part has been translated into English by various writers in the 3rd German and 4th English editions, Griech. Denker, Leipzig, 1905-8 (three vols. of an Eng. tr. have appeared, London, 1905 E. R.)); W. Windelband, Gesch. der alten Griechen, 3 vols. (translated into French), Leipzig, 1892-97; J. Denkel, 'Die Ethik und die Überlieferungstheorie in der 1810 Jahre des griech. Alterthums,' Tübingen, 1857; Th. Ziegler, Ethik der Griechen und Römer, 2 vols., Bonn, 1886; cf. also L. R. Farnell, _Greece and Babylon_, Edinburgh, 1912.

A. C. PEARSON.

ETHICS AND MORALITY (Hindu).—Hindu ethics is deeply tinged with the belief in transmigration or rebirth according to the doctrine of karma ('action') under which every act, whether good or bad, finds its reward, not only in heaven or hell, but in innumerable other bodies, from a god to an insect or plant, or even a stone. The same gradation of rebirths which pervades the whole creation prevails in the more limited circle of human life, from the high-born Brahman to the low-grovelling Caste. The belief, therefore, that the body is an ephemeral form of ours rather than depend on the various shades of merit and demerit acquired in a previous existence. The hymns of the Vedas, it is true, contain no distinct allusion to metempsychosis; they abound in glowing descriptions of the delights of paradise and the torments of hell. The Upanisads, on the other hand, mention, for
instance, the rebirth of virtuous men as Brāhmans or other persons of high caste, of wicked men as dogs, hogs, or Chandālas, and of those who eat rice and meat (catuskata) as animals (panchaśūla catuskata).\(^\text{[10]}\) The idea of karma, or action, and karmāvakāpāh, or ripening of acts in future births, pervades the six systems of philosophy, and the earliest lawbooks of the Dharmasūtra class. This is the highest goal of Indian philosophy to get rid of the fetters of action and consequent rebirth by overcoming the inclination to be active. The question of will, whether bound or free, does not concern these philosophers; they regard the individual soul or volition by absorption into the supreme Being, the Dharmāstras state the special duties of men, as determined by their rebirth in a particular caste, notably the Brāhman caste; and they discuss the obligations of Brāhman ascetics who, by keeping the five vows of abstinence from injury to living beings, of truthfulness, of abstinence from theft, of continence, and of liberality, by the practice of various austerities, and by concentration of mind, wish to obtain full deliverance from the bonds of karma and to reach final emancipation.

The narrow-mindedness of Brāhman moralists was objected to by Buddha and his followers. Thus Buddha is said to have been consulted by two Brāhmans as to whether a man becomes a Brāhman who orpires that the station of a Brāhman is not due to birth, but to abhorrence of the world and its pleasures. The Buddhist Dharmasūtras, a beautiful collection of precepts and moral sentiments, contains an eloquent exposition of this doctrine in all refinement, patience, contentment, mildness, sympathy, which entitle a man to be rightly called a Brāhman. In other respects, there is no essential difference between Brāhmanical and Buddhist ethics. Karma in Buddhism is the cause of the aggregation of the five skandhas, which include all mental and physical phenomena, and therefore of birth and rebirth, of the universal passage through a succession of existences (sahānīret). The middle course, which destroys the working of karma and leads to the cessation of suffering and to Wisdom and Nirvāṇa, is the Eightfold Path, consisting of right views, right thoughts, right speech, right actions, right living, right exertion, right recollection, and right meditation. The five commandments (pañcakāśāsā) of Buddhism—Kill not, Steal not, Lie not, Adulterate, Drink not—closely resemble the above mentioned five special duties enjoined on Brāhmanical ascetics. Buddha made these rules obligatory on all his followers, and added five more severe commandments for his monks—not to eat at forbidden hours; not to attend worldly amusements, such as dancing or singing; not to use wreaths, unguents, or ornaments; not to use high mats or thrones; not to acquire or receive gold or silver. The five first rules of this Decalogue (dakṣaṭāsā), though binding on all men alike, were made more stringent in the case of Buddhist monks and nuns. Thus chastity means in the case of monks and nuns absolute abstinence from sexual intercourse; in the case of laymen it means refraining from adultery. There are also secondary precepts extending beyond the rules of the dakṣaṭāsā for those who have renounced the world. This superior morality corresponds in many particulars to the rule of life prescribed for a Brāhmanical yati (ascetic), which do not differ essentially from the moral code and the notions of right and wrong current among other nations of antiquity, except perhaps in the peculiar sanctity attributed to Brāhmans and all their belongings, and to the cow, the sacred animal of the Hindus. But every sin may be atoned for his anterior births, the Jātakas, that in former births he often gave himself up as a victim to satisfy the appetites of hawks and beasts of prey; and on one occasion the Brahma, a tigress, sacrificed his own body to supply the tigress and her cubs with food. This regard for animal life comes out very clearly in the rock and pillar edifices of the Buddhist King Asoka (c. 250 B.C.), which contain ample discourses on Buddhist morality, furnishing an early and authentic record of Buddhist teaching. Reversion to parents, elders, and preceptors, truth and charity and true ceremonial, tolerance of the belief of others, kind treatment of slaves and servants, liberality to ascetics and Brāhmans, truthfulness, purity, gentleness, and saintliness are other virtues extolled in the edicts of king Asoka.

Jainism, which, unlike Buddhism, continues to flourish in India at the present day, goes even beyond Buddhism in the regard paid to animal life. The oaths not to hurt animals is exacted from the Jaina ascetic on his entrance into the Order; it demands watchfulness over all functions of the body by which anything living might be hurt, and for this purpose the Jaina ascetic must carry with him a straw to wipe his mouth after drinking water, a broom, and a veil before his mouth, in order to avoid killing insects. In his four other oaths the Jaina monk promises, like the Brāhman, fornication, abstinence, and with the same words, not to speak untruth, to appropriate nothing to himself without permission, to preserve chastity, and to practise self-sacrifice. Asceticism, both inward and outward, is made especially prominent in this religion; it embraces repentance of sin, confession of the same to the teacher (as in Buddhism), penance done for it, the study and teaching of the holy faith, pious meditations, the renunciation of all worldly possessions, temperance, begging, different kinds of self-mortification, especially by fasts which may be continued to starvation, voluntary death by withdrawal of food being regarded as a sure entrance to Nirvāṇa. The rules of the 'right way' for the Jaina laity are less severe, the oath of chastity, e.g., being replaced by that of conjugal fidelity, just as the rules for Brāhman and Buddhist laymen are less strict than those destined for the clergy. In practical life Jainism may be said to make of its laity earnest men who excel in an exceptional willingness to sacrifice anything for their religion. Coexistence of the clergy and their dependents is united against humanity and its interests, and conversions of people of low caste to the Jaina creed are not uncommon even at the present day.

Later Bṛāhmaṇism, as represented in the Code of Manu, the 'Great Epic' (Mahābhārata), and many other productions of what is called classical Sanskrit literature, reiterates the old inquisitive law of caste, and tries to enforce the claims of the priestly castes to spiritual and social superiority.

'The Hindu code as a whole is savage and antique' (Hopkins). Thus in criminal law the jatśattra is carried to an extreme degree (see CRIMES AND PUNISHMENTS [Hindu]). Witnesses in a court of justice are exhorted to speak truth, with many fine sentiments extolling veracity and denouncing falsehood, yet perjury is permitted when an accused of respectable castes may be saved from death by it (see LAW AND LAWBOOKS [Hindu]). Long lists of offences of various degrees are given, which do not differ essentially from the moral code and the notions of right and wrong current among other nations of antiquity, except perhaps in the peculiar sanctity attributed to Brāhmans and all their belongings, and to the cow, the sacred animal of the Hindus. But every sin may be atoned for

VOL. V—32
by performing a penance (see EXPIATION AND ATONEMENT (Hindu)); and these penances were an important source of profit to the Brahmans. Though each class has its special duties assigned to it, there are also general obligations common to all classes, such as restraint, purity, liberality, self-control, regard for animal life, obedience towards elders, visiting places of pilgrimage, sympathy, straightforwardness, and punctuality. The doctrine of ahimsa (non-injury to living beings) is, however, not so much insisted on as in the Buddhist and Jainah creeds; for a sacrifice, cattle may be killed, and the meat of such cattle may be eaten, although the doctrine of karma and of the soul's passage through all kinds of animal bodies, according to its deeds in a previous life, is fully recognized in the Code of Manu. The merit of asceticism, combined with religious meditation, is highly extolled; and the entrance into the order of religious mendicants is supposed to form a regular stage in the life of a Brahman, preceded by the stage of a hermit in the woods (vibhushanaprasada). The sacramental element is very strong in the Mahabharata also, which, like the codes, is a vast thastusaurus of Hindu ethics. Thus there is an eightfold path of religious duty, as in Buddhism, but in it the asceticists insist on the principles of truth, penance, truth, mercy, self-control, and lack of greed. The upaniṣads contain many touching pictures of domestic and social happiness: children are dutiful to their parents and submissive to their superiors; parents are fondly attached to their children, and ready to sacrifice themselves for their welfare; wives are loyal and devoted to their husbands; husbands are affectionately disposed towards their wives; love and harmony reign through the family circle (M. Williams). The didactic and sententious note prevails in the whole range of Sanskrit literature (Madonell). It is particularly strong in the old collections of fairy tales and fables, which agree in putting instructive speeches and moral sentiments into the mouths of jackals, cats, elephants, parrots, monkeys, and other animals; and it also pervades Sanskrit lyric and dramatic works, among which the Priyodbhandhachandravanga furnishes an instance of an allegorical and philosophical play which may be fitly compared to some of our old Morals. The keynote in Sanskrit moral literature is the conception of fate, but fate is declared to be nothing else than the result of action done in a former birth, so that every man can by right conduct shape his future fate himself.

Passing to modern developments, we find a general tendency on the part of religious founders such as Basava, the founder of the Lingayats, in the 12th cent., Kabir, the founder of the Kabirpanth, in the 16th, Nanak, Dādā, and Chaitanya, in the 16th, and many others, to proclaim the social equality of all those who enrolled themselves in their Order. In practice, however, this levelling doctrine, such as forbids met with only partial and temporary success. As a way of salvation, the 'way of love and faith' (bhaktimarga) has been gaining ground, though the 'way of works' (karmamarga), i.e. the practice of religious rites, austerities, penances, and sacrifices, is held to be equal, and the 'way of true knowledge' (jñanamarga) is held to be superior to it. The pūṣṭindrā, or 'way of enjoyment,' is sometimes recognized as a third way. The Purāṇas, and the important Cenuse of 1806, contain some interesting attempts to establishing the actual standard of morality in India.

The code of morality of the ordinary Hindu is much the same as that discussed under moral maxims. There is nowhere attributed to a code. He knows that it is wrong to commit murder, adultery, theft, and perjury, or to covet, and he honours his parents, in the case of the father, at any rate, to a degree ex

---

ETHICS AND MORALITY (Japanese).—1. Ancient Japanese.—The Japanese nation, although through its long history has cherished several peculiar forms of morality, which, of course, must be admitted to have undergone modifications to some extent, although their essential characteristic has remained unaltered, the characteristic feature of which is the similarity of the ancient Japanese are to be found in the morality of Japan at the present day. One of them is certainly nationalism. It is recognizable in the old mythology, which, unlike that of any other land, centres in the Imperial family and the State. In the course of the creation, the Divine pair, Izanagi and Izanami (see Cosmos and Cosmology (Japanese)), first produced the country (i.e. the earth) and, after a long interval, the Sun-goddess, the Moon-god, and one other son. The first of the three was made ruler of the heaven-world; she afterwards sent her grandson to Japan, gave him a mirror, a sword, and a bell, and bade him go down to their posterity as the royal insignia, and said:

'this country has to be ruled by my descendent; thou oughtest to go and reign over it. The sacred dynasty is to be so prosperous that it will last eternally, even as heaven and earth last.'

The Sun-goddess is sister to the country, and is regarded as the first ancestor of the Imperial family and of the people in general, which are to be, as her prediction indicates, eternally the ruler and the ruled. A throne occupied by a single dynasty.

---

1 Nihongi, fasc. 2.
is the possession of no nation in the world except the Japanese. A great respect has always been paid by the people to such a sacred throne. At one time the Mikados, or the Leaden Gods, were living gods, and, even when they were deprived of ruling power, the people never ceased to pay the respect due to them. This does not mean that they stood in a slaveish relation to the Imperial family, which, on the contrary, is related to the people as the main house to branch houses. The Mikados are not their conquerors, as with the majority of other nations. The people are often addressed by the Mikados as children, but this accounts for the special relation between the two. Submission to the Mikados, therefore, is not merely loyalty but filial piety. In contrast with China, filial piety in Japan comes next to loyalty, though in most cases the two are mentioned side by side. In the Japanese family, parents are absolutely obeyed by their children, and superiors by inferiors, as the Mikados are obeyed by their subjects. Filial piety is not so highly valued as loyalty, which is absolutely and very often bids people sacrifice other virtues for its sake. Dutifulness to parents and obedience to superiors were the chief morals in the Japanese home life, and when children were modified by the laws needed to rule them, or minute moral doctrines to regulate their daily life, because they were simple, honest, and good, and committed neither illegal nor immoral acts. They were practical and optimistic to an extreme, thinking neither of the future nor of the past, but only of the present. Death was hateful, but not fearful, to them. They seem never to have thought of whether they would go after death—a state of things which was much modified after Buddhism was introduced. In ancient chronicles, we meet with the words nihon-ta (a gentle spirit) and aratama (a rough spirit); the former denotes the virtues of gentleness and generosity, the latter those of bravery and chivalry. The old Japanese were gentle and magnanimous on the one hand, and so were kind and indulgent to others, and lived in harmony with the world; but, on the other hand, they had strong wills and brave hearts, which, when duty called them, very often made them face dangers, and, if necessary, sacrifice their lives for the sake of the fatherland.

2. Shintoism.—The word shinto is not Japanese, but Chinese; it means the ‘Way of the Gods’ (Kami-no-michi). Some say it is a religion, some a moral system, and others a political way. It may be any or all of these three, for in ancient days no distinction was made between them. It presents no peculiar doctrines, and nothing like a code of ethics; but, as it is the great way of the Empire, all the Japanese, ancient and modern, in spite of different creeds, must be Shintoists. The Shinto scholars (e.g. Hirata) say that they are ancient and moving in accordance with the Shintistic teaching of the divine deities; when they venerate Mikados and parents, when they try to promote the national welfare and happiness, or when they lead an honest and godlike life. Shinto is a mixture of Ancestor-worship and Nature-worship, as may be seen from the nomenclature of the deities worshipped. The Japanese have combined their ancestors with nature in ancient days; then they still, and worshipped them. In dealing with them in such a manner, they mean that the ancestors are their progenitors, superiors, and benefactors; not only the creators of their bodies, but the furnishers of their life, professions, estates, and all other things. They held the same thing true of the deities which were their perpetual favourites. Esteem for their ancestors being common to all, the sentiments of loyalty, patriotism, and filial piety, the love of family and the feeling of honour are combined, and thus a phase of morality peculiar to the Japanese has been developed. In ancient times no distinction was made between worship and administration, between reverence for the gods and loyalty. Loyal people only composing the divinity of the deities, and the Empresses in taking the reins of government were appeasing and worshipping national deities. The very words matsuri (‘worship’) and misarigoto (‘worship-matter’ or ‘administration’) signify the identity of these two. Patriarchal monarchy was thus theocratical monarchy as well. Various ceremonies were performed to serve the national deities, of which the most important is the ceremony of purification or harai—important alike from the religious, the moral, and the legal point of view. Oharai, or grand purification, was performed at the Court twice a year. In this, it is a mere ceremony, to drive away the evils resulting from the sinful, immoral, or unlawful deeds of the whole nation during every half-year; and, when any serious offence was committed, a ceremony for the same purpose was performed. Misogi (body-washing) was another rite of purification which at first consisted in washing the body when one touched anything unclean, but afterwards became ritualistic, and was made between them. Defilement, mental or physical, was hateful to the Japanese; and, according to their simple ideas, any guilt, moral or legal, could be as easily removed by the performance of purifications as literal death could be removed by bathing. See, further, art. Shintoism.

3. Bushido.—Bushido, or simply Budo or Shido, is the Chinese term for the Jap. Mononofu-no-Michi, lit. ‘the Way of Fighting Knights or Samurai’ (attendants). It is a moral system intended for the military class. Though its full development belongs to later ages of the national history, say the feudal periods—the 12th and following centuries—it may be said to be as old as the race themselves; and Yamada Toshimichi (the soul of Japan), Yamato no Miya (a classical name for this country) is not only the soul of the military men, but that of the whole nation. Bushido is an indigenous religion of the nation, so Bushido is their national morality, or at least its essence. But here we have only to deal with the Bushido for the Bushi class, and not as national morality. The Bushi should be, in the first place, loyal to lord and filial to parents; these, along with reverence for gods and worship of Buddhás, were considered their chief duties. Indeed, loyalty and filial piety were the fundamental morality of the Bushi class, as is the case with the nation in general. Then they should be brave and fearless in fighting, and calm and never flinching in the face of any danger or destruction, national or personal. In session, and the like, were what they always specially cultivated; but they were not by any means foolhardy or brutal in fighting or in their daily life. Their courage was restrained and softened by the feeling of benevolence and the sense of rectitude and honour; they were not to do anything brutal or underhand, but what was right and valiant at any time. Benevolence is one of the chief virtues of the Bushi; and many pathetic stories are told of 'benevolence of warriors.' Kindness, magnanimity, sympathy, and the like, were praised as supreme virtues.  

1 Sawayaug, op. cit. infra. 2 Motooki, Nihon-shi, 1771. 3 Hagé, op. cit. infra. 4 Arihia, op. cit. infra. 5 Id. 6 Id.
virtues for the military men, who might otherwise be disposed to coldheartedness or even to cruelty. They should be polite to superiors as well as to inferiors in the fulfillment of their duties, and simple in their life. These, with a few others of a kindred nature, were the qualifications thought necessary to Samurai-spirit. The Emperor Meiji gave the five copious, who appeared to be five kinds of priests, in which pursuits, knowledge, and truth to these two; and the whole passed under the name of the five cardinal virtues, the sum-total of human virtue. In human society men are related to each other in five different ways, which impose upon them as many obligations. They are as follows: rectitude between lord and subject, familiarity between father and son, distinction between husband and wife, grade between elder and younger brother, and confidence between friend and friend. The most important of these are the first two, especially the second; hence filial piety is the root of all virtues, of all moral practices. Generosity, respect, gratefulness, humility, faithfulness, sincerity: these are some of the virtues commended in the Confucian teaching. For thirteen centuries the Japanese have lived under this moral teaching, and probably there is nothing in Japan that has not been influenced by it; but they have wisely adopted only the points suitable to their special culture and national development, neglecting the elements that might be injurious to public morals or fatal to the welfare of the State. Further, see Confucian Religion, Confucius.

5. Buddhism.—Buddhism was officially introduced into Japan in A.D. 522. Its introduction at the Court—a controversy which was not merely religious but also political and tribal, and which after a violent conflict resulted in victory for the pro-Buddhist party. Prince Shotoku (572-622), one of the wisest and greatest personages Japan had ever produced, did all in his power for the advancement of the newly introduced creed, and well deserves the high respect paid by the Buddhists to his memory. The doctrine of Divine incarnation, according to which some Shinto deities are the incarnations of Buddhas, Bodhisattvas, or certain Indian Devas, was first taught by Prince Shotoku and then by Gyoki (670-749), a learned and virtuous high priest, and was further broadened and deepened by two great men who arose shortly after his death—Saicho and Kukai, who respectively founded the Tendai and the Shingon schools of Buddhism, and then either of the two. Strangely enough, the two somewhat antagonistic creeds coexisted in unity for nearly a thousand years, until their final separation in 1871. Prince Shotoku and other great personages who appeared early in the history of Buddhism in Japan seem to have striven to nationalize its teachings and to bring it into close contact with the nation as a whole. During those days all the work of the Buddhist was designed in the interests of the national welfare and peace. The Emperor Shomu (reigned 724-781), for instance, had a monastery and a nursery built in each province, and these, and the Japanese system, were as follows: Chinese ethics is founded on the worship of Heaven, whereas the Japanese worship ancestral spirits; the Chinese pay more respect to men of wisdom, and hence admit that unwise or tyrannical monarchs may be dethroned at the people's will, whereas the Japanese regard the Mikados as sacred and inviolable; and, lastly, the chief virtues of the former are benevolence, fidelity to the duty, and the latter attributes supreme value to loyalty and rectitude, loyalty and filial piety being, according to their national morality, identical.

of unselfishness and freedom from desire being in harmony with the essential elements of Yamato-damashii, it has found a ready entrance into the Japanese thought. Its teaching, however, softened the otherwise harsh character of the national spirit. It introduced the idea of another world, which was entirely lacking in the ancient Shinto. This teaching, blended with the import of teaching may very well be understood as the In the change of the name, the word "Sawanagri," originally meaning "the village of the merchants of the cities and among the Bedawin. The Prophet opened his propaganda among them by denouncing their sins and threatening them with the Day of Judgment and the fire of Hell, but at first he encountered nothing but mockery; and it was only when he had in some measure accommodated his message to the present world that they gave heed to his words about the hereafter.

But, while the ancient Arabs were intent upon material advantage and enjoyment, they were not wholly unmindful of higher things. As we may see from the powerful impression produced among them by satirical poems—an impression due only in part to the dread of magic—they had a high sense of both personal and tribal honour. The moral ideal of the Bedawin found expression in the patient endurance of privation, in a loyalty accorded not so much to the chief of the tribe as to co-equal fellow-members; in a courage which, in open warfare and still more in marauding expeditions, was sparing only of the lives of enemies; and, finally, in hospitality—a virtue which, it is true, is ever a native of regions where there is little occasion for its exercise. As compared with the Bedawin, the people of the cities had, to say the least, a larger share of worldly wisdom. The Meccans, in particular, both before and after Muhammed’s day, were astute enough to put their market under the protection of a sanctuary, and to exploit the very piety of those who came to trade within the sacred precincts. The present inhabitants of the holy city quite frankly avow their adherence to the ethics of the happy mean, asserting that, while the people of Yiddah are very worldly, and those of Medina very devout, they themselves hold an even balance between heavenly and earthly interests.

In pre-Muhammadan poetry terms expressive of moral sentiments occur only sporadically. We find, indeed, warnings against arrogance and threatenings of Divine vengeance; but such exceptions, in which moral and religious concepts are distinguished from law or custom, are probably traceable to Jewish-Christian influence. It was under that influence, at all events, that Muhammed stood forth as the voice of the one God, and the words of tradition, ‘for the improvement of morals.’

Muhammed made the demand of personal belief and personal morality.

“No bidden soul shall bear the burden of another.”1 In the Day of Judgment every one shall be answerable for himself: ‘O ye people, fear your Lord, and dread the day when the father shall not alone for the son, nor the child alone for all for his parent.”2

Hence, too, the Qur’an urges—though less insistently than the NT—the necessity of repentance, conversion, and good heart, the child and parents—Good intentions are commended; unpremeditated lapses from virtue are leniently judged. In short, Allah makes it no onerous task for His faithful to serve Him a forgiving, merciful deity.

Nevertheless, as Muhammed’s earliest adherents were but a small company, it was no child’s play for them to respond to his demand of personal morality. Such a demand shattered the old family ties and can only result in conflict—at first somewhat harshly, though afterwards in a milder fashion—immortalizing usage and custom. In this way the moral fellowship of the true believers came to mean more than the tribal relations. In the light of the ideal thus introduced every believer

was henceforth the neighbour or brother of every other. Islam was to be a universal brotherhood, in which kindness and equity should count for more and love of mankind was to be additional, not less than that which is felt for the human race. Verily, thy Lord provideth plenty for whomsoever He will; and He too giveth with His grace to all who observe His servants. Kill not your children for fear of poverty; we will provide for them and for you a provision and a reward. If you kill a man to gain a reward, less thou be made to sit down in broil and beggary. Verily, thy Lord provideth plenty for whomsoever He will; and He too giveth with His grace to all who observe His servants. Kill not your children for fear of poverty; we will provide for them and for you a provision and a reward. If you kill a man to gain a reward, less thou be made to sit down in broil and beggary.

In principle, no doubt, private revenge was superfluous; but in practice the former was still permitted, though in a somewhat mitigated form. It had now to be kept within the bounds of moderation, and must involve none but the actual culprit. Nor did Muhammad help to foster a higher regard for human life by prohibiting the heathen custom of killing female infants; but, on the other hand, the practice of feticide has all along prevailed, without censure, in Muslim countries.

The ethics of the Qur’ān might be summed up in the trite formula: ‘Believe and do right.’ Belief, of course, is the primary obligation, since without belief all religious acts are vain—merely phantoms in the waste. But, as it does not come within the scope of the present article to deal with belief (see Faith [Muslim]), or with the duties of religion in the narrower sense, the question here is with the question, What is implied in ‘doing right’? Of human virtues the Qur’ān insists most frequently and most urgently on beneficence—the bestowing of benefits upon the poor, the needy, the orphans, the strangers, the slave, and the prisoner, especially in the form of alms (zakāt). By almsgiving a person not only helps others, but also manifests the true spirit of self-denial—in the expectation, it is true, of winning, not indeed the treasures of land or earth, but the reward of Heaven. This spirit was displayed by Muhammad himself, chiefly in the earlier years of his prophetic activity in Mecca, when he declared against the rich. Afterwards, when his followers had become a political organization in Medina, the antagonisms were somewhat less pronounced. A similar development appears in the practice of zakāt. Originally a voluntary expression of love, and, in the view of Oriental Jews and Christians, almost identical with piety or the fear of God, i.e., with virtue in general, it gradually became a tax upon property, and as such became one of the five pillars of Muslim law. Hence, the tax was usually assessed to be assessed for the public treasury. The collectors of the tax did not neglect their own interests, while the lawyers or priests (so far as we may judge from the traditions of Muhammad) claimed to rank pre-eminently among the poor and needy who had a right to share therein.

Besides almsgiving, many other virtues are spoken of in the Qur’ān as acceptable to God. A series of corresponding commandments which, while depending on the Mosaic Decalogue, is given in sura xxiii. 23–40:

A mercy god with Allah, lest thou sit down despised, forsoak. Thy Lord hath ordained that ye shall worship none but Him; and kindness to your parents, whether one or both of them attain to old age beside thee; and say not to them ‘Be silent!’ neither murmur against them, but speak to them in gracious words. And chair humbly to them out of compassion; and say, ‘Lord, have compassion on them, even as they were compassionate of me when I was little.’ Your Lord knoweth what is in your souls, whether ye be righteous: And verily, He is forgiving towards those who return to Him with repentance. And to thy kindred send thy due, and also to the poor and the wayfarer; yet waste not wastefully; for the worship of the House of Satan, and Satan is their unfaithful to His Lord. But if thou dost not, then turn away from them, and seeketh from thy Lord bounties for which thou hopest.

1 Qur’an, xviii. 105, xlv. 39.

2 See the third, being (1) the creed, (2) the ritual of prayer, (3) fasting, and (5) the pilgrimage. According to an ancient tradition, Muhammad enjoined as a sixth primary obligation the giving of one’s neighbor’s property to the need of others what one would wish done to oneself.

3 Nowadays (i.e., when the process of revelation mediated by Muhammad, and therefore also the possibility of discerning the

In any wise speak to them with kindly words. And let not thy hand be fettered behind thy neck; nor yet quench the light which God hath given thee, lest thou be made to sit down in rotting and beggary. Verily, thy Lord provideth plenty for whomsoever He will; and He too giveth with His grace to all who observe His servants. Kill not your children for fear of poverty; we will provide for them and for you a provision and a reward. If you kill a man to gain a reward, less thou be made to sit down in rotting and beggary.

thoughts of the heart, has ceased for ever; we judge people entirely by their outward actions; we protect him who appears to us as a near kinsman, and we know nothing that is within—Allah is the judge thereof—and we do not protect him who appears to do wrong, nor do we find faith in him even if he asserts that his motives are pure.

It is likely enough, indeed, that many who availed themselves of this pronouncement forgot the parenthetic clause regarding the judgment of Allah. It was easier, moreover, in conformity with the sunnah, to use a toothpick, to rub oneself with water or sand, and to submit to circumcision, than to cleanse the soul from sin, and with pure heart to serve Allah in spirit and in truth. Thus the great bulk of the moral precepts of Islam, as found even in the Qur'an, and more particularly in the tradition, bear a somewhat external and—ones may venture to say—commerical character. The believer has an account with Allah. One tradition has it that a convert to Islam has all his previous good deeds put to his credit. The sunnah agrees with the Qur'an in assigning the leading place among good works to almsgiving. If a man is unable to give alms, let him labour with his hands—in order, of course, to make himself fully free from the fruits of work presented by the tradition. Only by way of exception do the hadiths—the Qur'an is silent on the subject—ascribe an independent ethical value to work. Thus the following saying was put into the mouth of the Prophet: "No man can have a better means than that which he has earned by the labour of his hands. David, the prophet of God, ate what he had earned by the work of his hands. But perhaps this saying, and others like it, may simply imply that work is superior to begging, though not to almsgiving. The practice of almsgiving, as indeed the element of self-denial in general that was present in Islam from the outset, was strongly reinforced by the influence of Christianity, and, subsequently, of Indian religions, as appears from the fact that the sunnah is much less distinctly Arabian in character than the Qur'an. When Islam had overspread the Christian provinces of the Roman empire, it assimilated many elements of Christian asceticism.

The assertion that early Islam was absolutely destitute of ethical sanctions has been refuted, above, by God. The Qur'an undoubtedly contains ethical elements. It is true that Arabic has no single specific term for 'conscience,' but the thing itself is quite adequately commuted by such terms as 'heart of heart.' According to one highly esteemed hadith, 'virtue is [the sum of] good qualities, iniquity is what disturbs the soul, and what thou desirest others not to know concerning thee.' The last clause certainly savours of conventionalism, but there are other traditions in which the requirement of inward sincerity is more clearly expressed.

Thus, e.g., we read: 'Shall I tell you what work stands higher than all prayer, fasting, and almsgiving? It is to make peace between two enemies;' or, again: 'Of more avail (than ritual prayer) is the prayer which a man offers in his own house, where no one sees him but Allah, and which has no other more to do than to draw near to Allah.' Another tradition tells how a pious female devotee who was using insulting language towards her neighbour was counselled to honey the Prophet; whereas his judgment regarding another woman, who was negligent of prayer and fasting, but gave to the needy and needed, and her name was Mary, the mother of Jesus, was "(she was) destined for Paradise. The companions of Allah is frequently set forth as a pattern for the faithful, and they are urged to the performance of pious works. According to a favourite and frequently quoted hadith, the best works are: (1) honour towards parents; (2) not to take a niece in marriage;

the Persian maxim that religion and government are sisters, were not much better. In the most numerous Muslim sects, the merging of religion and government is often a source of contention. The doctrine of *tughrūya* ('prudence'), according to which it is the primary duty of the Shi'ite who sojourns in the land of the adversary—a very elastic term—to disavow his convictions by word and deed, for the sake of his personal safety, is one of the most dangerous arts known. Where within the bounds of Islam, and at all periods of its history, the discrepancy between ideal law and actual practice has, on the one hand, led to a policy of compromise on the part of the majority, and, on the other, given rise to scruples and conflicts of conscience, and also to numerous attempts, under the leadership of a Mahdi, to supersede a sinful and worldly régime by a better. In Islam, accordingly, aspirations after moral and religious reform are always involved with or accompanied by political action. The work of a man like General Booth, who, as leader of the Salvation Army, seeks to achieve moral and spiritual regeneration by methods which are incompatible in Islam, unless he or his officers tried at the same time to grasp the reins of political power.

The historico-legal development of Muslim jurisprudence cannot be dealt with in detail here, and it must suffice to refer the reader to the works of Goldziher, Snouck Hurgronje, and others (see the Literature at end, and cf. art. Law [Muhammadan]). We are, meanwhile, concerned with the *fiqh* only so far as it bears upon ethical conceptions and leaves room for the free expression of moral life. In this reference the most important point is the classification of actions according to their gradations of legal obligation, and here we find a number of such arrangements more or less in agreement with one another. The most widely accepted division has five legal categories, as follows: (1) absolute duty (*fard* or *wājib*), embracing actions of the performance of which is rewarded and their omission punished; (2) commendable or meritorious works (al-`amal al-mustabhāt), which are rewarded, but their omission not punished; (3) permitted actions (al-`amal al-muháb), which are legally indifferent; (4) reprehensible actions (al-`amal al-makrūh), which are disapproved of, but not punishable, by the law; (5) abominable actions (al-`amal al-kārim), the doing of which calls for punishment.

As regards the reference of each particular action to its proper category in this arrangement, there is, as might be expected, no unanimity among the learned in Islam. The more easy-going moralists, among the sages of the law endeavour to make out that certain forbidden actions are doubtful, i.e. permissible, and certain obligatory actions merely commendatory. In general, the great regulative principle is public opinion, which is based upon the thought and decision of the authoritative scholars of the day. This concept (al-*ijma*), is binding upon the conscience not merely in matters of faith, but also in the most trivial details of daily life. Yet, in spite of all, many Muslims, whether from want of knowledge or from want of will, order their lives by unauthorized *ābd*, or, when accounted still worse, exercise their discretion.

Further, the law is not uniformly binding upon every one. It distinguishes between duties incumbent upon all (fard *al-a`la* or *l-lain*); and obligations which affect certain individuals only (fard *al-kifāyan*). The duty of taking part in the holy war is an instance of the latter class.

Another distinction of importance is that between great and small sins—a distinction elaborated largely in connexion with the doctrine of evidence, which demanded that witnesses must be above reprobation. Since, however, among the great sins are murder, unchastity, misappropriation of property belonging to a ward, the taking of interest, the refusal of zakāt, and the like. To the class of small sins are assigned such offences as taking part in unlawful games or listening to hidden music.

As might be expected, the science of the law, in dealing with such distinctions, frequently degenerates into an arid casuistry, or becomes a sophistry which will elude. Every one can and defraud either God or man. The letter of the law kills the spirit of morality. An illustration of this will be found in the *Thousand and One Nights*, Night 296 ff. The manner in which legal luminaries tone down the prohibition of wine-drinking is set forth by Goldziher, *Vorlesungen über den Islam*, p. 63 ff.

4. The development of doctrine.——Islam found in the countries which it conquered not only legal and political institutions, but also systems of doctrine with more or less of an ethical element, as well as a popular didactic literature. With the latter we shall deal below (§6); of more immediate importance for the development of the Muslim doctrine of faith is the number of sects which were of Christian origin.

A factor of the utmost significance for later times was the ethic-religious system of the Mu'tazilites—descendants of the Qādārites. This sect was designated originally 'the people of justice' (of Allah), because they held that Allah is the Righteous One who rewards men according to their deserts. This was not a genuine Muslim conception in the early days. The original conception of Allah—and, somewhat spiritually, it still holds sway—was that, as the Almighty, He is a vengeance-breathing tyrant towards His enemies, and an indulgent God of mercy towards His friends. In His vengeance He is arbitrary; in His love and mercy, capricious. With many persons, no doubt, this idea was a cause or a consequence of unprincipled conduct. It was possible for a man to transgress the whole law and still remain a believer; confession to Allah in words, or even in thought—faith without works—was all that was required. Such was the teaching of the Murji'ites, who, though they discriminated between small offences and great sins, yet held that even the latter were forgiven to the Muslim who but uttered the creed.

This Murji'ite teaching was challenged by the originally powerful sect of the Khārijites, who have been called the puritans of Islam. They looked upon a great sinner as an unbeliever, and maintained that there is no true faith without works. This view approximates to the Mu'tazilite ethics, which might indeed be regarded as that of the Khārijites modified by the influence of Christi-anity, and, subsequently, of philosophy. It is certainly true that many of the early Mu'tazilites insisted emphatically on the importance of good works, and in this respect they might be compared with the Pelagians of ancient Christianity. They were neither liberals in theology, nor libertines in ethics.

Their speculations upon the Divine righteousness, moreover, were closely connected with the question of human freedom. No quite unequivocal teaching on this problem could be drawn from either the Qur'an or the hadith; nevertheless the devout of that age were always inclined to the doctrine of predestination. The idea that everything, not even excepting evil and sin, is ordained and brought to pass by Allah largely dominates the popular mind to this day. The Qādārites and Mu'tazilites, on the other hand, were probably the origin of the controversies of the Eastern Church, preached the
Doctrine of free will. In support of their position they could appeal to certain passages of the Qur'an, according to which Allah does not cause, but simply allows, the sinner to go astray. They held, accordingly, that man is the author of his own deeds, the arbiter of his own good or evil fortune, and that Paradise or Hell lies within his own choice. Evil and sin have their source in the human will; whatever comes from Allah is necessarily good. Subsequently, the school of asceticism taught that man can devise nothing but good, and must in all things work for the welfare of His creatures. Here, in effect, we have a theology, such as has frequently been propounded from Plato's day, and as frequently shunned by the monistic trend of thought or of reason. The theology of the Mu'tazilites was influenced even in its early stages by Neo-Platonic ideas. Their doctrinal system resolved itself in time into a rationalistic theology, with reason as its first principle—the source, not only of knowledge, but also of the laws of conduct. It is reason, they held, that distinguishes between good and evil.

The doctrine of free will became in this way a rational determinism. An action is good when reason finds it good or beautiful; an action is evil when reason finds it evil or repulsive; in short, moral distinctions do not depend upon the will of Allah. Man is given an authority to discernment, and obedience to reflection. Knowledge, discernment, reflection—it is these, accordingly, that reveal to us what is in itself good or evil. That which is in itself good is binding upon the will of God Himself, and thus involves a limitation of both His omnipotence and His freedom. In order to leave room in human life for a rational freedom and an absolutely free sphere of action, for self-determination and moral responsibility, Allah was represented as being conditioned by the law of His being.

While the Mu'tazilite doctrines maintained their position in Shi'ite literature, the orthodox party in Sunnite Islam adopted a mediating position. They would not cast the shadow of a doubt upon the doctrine of God's omnipotence and unlimited freedom. Human beings are absolutely dependent upon Him: their good purposes, their good works, the ability to carry these into effect—all flow from Him, from His mercy and grace towards mankind. Man, however, as was maintained by the orthodox Ash'arites, is an organism capable of appropriate God-like works, and it is this appropriation (bash or tiksidh) that constitutes the believer's sole merit. And even his great and heinous sins do not make him an alien to God, but he is being helped to higher ranks. But amongst them were also a number of brooding idlers, who began to speculate in Oriental fashion; and it was accordingly in Sufism that the practice of asceticism—from about the 8th cent. A.D. onwards—found a theoretical basis. Platonist-Bythagorean doctrines, gleaned from Hermetic and Gnostic writings, here joined hands with Indian speculation. Ascetic morality is always founded upon the conviction that the human body is of little value, if not indeed absolutely evil, or else a mere phantasm; while the soul, on the other hand, is regarded as the essential element in human nature, or at least as forming a stage of transition to the higher life, that of the soul of God. Thus the supreme object of human endeavour is to free oneself from the bondage of sense, to purge the soul of foul desire, and to become pure Spirit, or God—not merely God's monastic in the sense that the devout believe, when he commits them, that they are permitted.

5. Ascetic-mystical ethics. So long as the primitive community of Islam remained comparatively free from the Prophet's call to renunciation, the world was generally complied with. But this state of matters did not last; the Arabs, with their predatory instincts, soon learned to appropriate the world, and, in succeeding generations, to enjoy it. Caring little for imperial rewards, they were in reality a military aristocracy, an oligarchy, in the empire. In no long time, however, the peoples whom they exploited and laid under tribute began themselves to embrace Islam, thus creating a situation that demanded a new policy, even in moral and religious matters. Here and there, moreover, a feeling of social injustice, on the part of the higher and lower classes, was not altogether absent, as a result, and in the new centres of culture, and this in turn prepared the way for a system of an ascetic morality—which, it is true, had never been entirely absent from Islam. This ascetic

morality had special links of connexion with the ideas of Christian monasticism.

One characteristic feature of monasticism, viz. celibacy, was, however, alien to primitive Islam; nor has it ever at any time gained general recognition. There is no proof that the Prophet is recorded to have said; and in his later years he showed by his example that woman may be regarded merely as man's plaything. The ascetic and religious life was not, however, what ever its object was, actually served, however, as a species of training for the soldiers of the faith. It consisted in fasting and watching, and accorded admirably with the performance of the ritual of prayer. But, when at a later day the ascetic spirit became more widely diffused, the positive value of the practice as a means of discipline was more and more lost sight of in favour of a purely negative renunciation. To morbid the flesh became the cry. Absolute trust in God led to quietism: in God's hands man should be perinde ac cadaver. The mystic eventually becomes a mere will-less pauper, who is given a gift, the alma he will be ask or hold out his hand to take, and who fills his feeble life with pious ceremonies. Morality is hardly to be looked for in such conditions. The mendicant (fajir) lives only for the moment and for his God; he is filled with knowledge of posterity, he is as good as dead. Yet it was but the absolutely consistent application of his convictions that carried him to such extremes.

The ascetics, clothed in their coarse woollen frocks (gig), sought to vindicate their manner of life chiefly by appeal to passages in the NT. A sense of sin and a craving for penance were the ascetic motives which largely helped to found the ranks. But amongst them were also a number of brooding idlers, who began to speculate in Oriental fashion; and it was accordingly in Sufism that the practice of asceticism—from about the 8th cent. A.D. onwards—found a theoretical basis. Platonist-Bythagorean doctrines, gleaned from Hermetic and Gnostic writings, here joined hands with Indian speculation. Ascetic morality is always founded upon the conviction that the human body is of little value, if not indeed absolutely evil, or else a mere phantasm; while the soul, on the other hand, is regarded as the essential element in human nature, or at least as forming a stage of transition to the higher life, that of the soul of God. Thus the supreme object of human endeavour is to free oneself from the bondage of sense, to purge the soul of foul desire, and to become pure Spirit, or God—not merely God's monastic in the sense that the devout believe, when he commits them, that they are permitted.1

1 For the Maturashite theory, which is akin to that of the Ash'arites, cf. Macdonald, Development of Muslim Theology, p. 309.
wise politicians and merchants, and is thoroughly
typical of this class of literature.\footnote{1}

A much larger and more elaborately systematized
contribution comes, through Syrian channels,
from the philosophical literature of Greece.
Collections of biographies, with supplements of moral
aphorisms, treatises, letters, etc., were very
popular. Philosophers of the Neo-Platonic
and Hermetic type, were extensively circulated.
Works of Plato and Aristotle, as also compositions
falsely ascribed to them, found great favour among
philosophers. None of the cardinal virtues which appears in many Muslim
writers on ethics. To Plato also was ascribed a
treatise on the education of children \textit{Adab al-
}shiyam, and a testament \textit{waqiyah} addressed to
Aristotle. Of Aristotle's own writings, Arabic
authors refer to and quote from the \textit{Nicomachean
Ethics} (Kitab al-akhlaq), which is said to have
been translated by the afore-named \textit{Hunain} or by
his son \textit{Ishaq} ibn \textit{Hunain}. Extant quotations
from this work show traces of Neo-Platonic
redaction.

These and other translated works of the kind
helped to mould the development of \textit{mu\'tazilite
and \textit{Suffi}e ethics. But it was only in the
limited circles of sectaries of scholars and persons of
culture that ethical doctrine attained the more
independent status of a philosophical science \textit{al-
akhlaq}. Conformably to the scholastic Arista-
telian tradition current in the East, philosophy was
defined as 'a knowledge of the essence of things
and a doing of the good.'\footnote{2} The theoretical side
was invariably discussed more exhaustively than
the practical, but the latter also received attention
from those who dealt with morals and politics as
more or less independent of each other.

But it was the pseudopigraphic writings of a
spiritualistic and an ascetic and edifying character
that produced the most powerful effects in this
sphere. These writings were often supplemented
by astrological speculations, according to which the
natural temperament and even the moral constitu-
tion of human beings are conditioned by the in-
fluence of the stars. The folly of man was
believed to consist in his being delivered from
matter and exalted to the pure spirit-world of the
higher spheres. This type of ethics, pervaded by
metaphysico-psychological speculation, has left a
characteristic mark in the system of the 'Pure Ones' or 'Brethren of Purity' \textit{(Huwad as-Safa)}.

In the system of the Brethren of Purity, the
moral nature of man is determined by the following
four causal agencies. (1) The bodily structure:
the body is composed of the four elements, and
a person whose body contains, say, much earth will
be harsh and greedy, while another, with a large
proportion of air among its components, will be
gentle and gracious, and so on. (2) Climate: those who live
in a northern climate have more courage than
those of southern lands. (3) Education. (4) The
influence of the stars. Without this, indeed, is the
most powerful of all, since the other three are
dependent upon it. Even education, which super-
poses something upon the natural constitution, is
affected by the stars. Hence the following posi-
tions. All this holds good of the first stage of
human nature, the stage of natural morality, in
which conduct is instinctively good or bad. But
the soul can raise itself above nature, and in the
second or physical stage, where man has freedom

\footnote{1\text{ Cf. also the will of a merchant in the \textit{Thousand and One
Nights}, Night 306ff.}}

\footnote{2\text{ See \textit{Ma\'arif}, ed. van Vloten, Leyden, 1895, p. 122f.}}
of choice, his deeds are praised or blamed according to their quality. Should a man reach the third stage—that of rational deliberation—he acts either wisely or foolishly, nobly or basely. Finally, the fourth or highest stage is that of the Divine contemplation, wherein he indulges in by godly prophets and holy angels, and a man is rewarded or punished according as he does or does not associate himself with them in the endeavour to become, as far as in him lies, like God.

The path by which this last stage of the Christian, ascetic goal of life is to be reached, according to the Brethren of Purity, is the practice of asceticism. The supreme virtue, the yearning for things above, or the love that leads towards God, must manifest itself upon earth in a pious endurace of, and indulgence to, all creatures, even the animals. Man thereby wins freedom from sensual passion here, and hereafter the ascet to the eternal light. But if a man does not in this life purge himself of bodily desire, and persists in 'foolish slumber and careless sleep,' he remains after death hovering in the air, transmuted and drawn downward by his fleshly passions. Hell is simply the state of existence, whether on the earth or in the air; Paradise, on the other hand, is the eternal world of the celestial spheres to which pure souls ascend.

The ethics of the teaching of the Brethren are imperfect, though in different degrees. But the sum-total of good qualities is found in the absolutely perfect man, who has the characteristics of the Platonic Idea and the 'wise man' of the Stoics. The Sunnite mystics find the perfect man (insan a'ta'la) in Muhammad; the Shi'ites in Ali or Husain. The Pure Ones are less definite in their choice, and—apart perhaps from the 'Iman of the Sunnites—they greatly honour—it is rather Socrates and Christ who win their enthusiastic homage. In their estimation the ideal of reason was realized in Socrates, and the law of love in Christ; and it is these great ones, accordingly, whom they seek to emulate. In the interests of this imitatio they concede a relative value to the earthly life in the flesh; the body should be guarded and cared for, so that the soul may have time for its full development.

The moral theory of the Pure Ones is a mystical intellectualism. It is found—in a somewhat less fantastic form, no doubt—also in the so-called Aristotelian authors of the new type. The Sunnite mystics find the perfect man (insan a'ta'la) in Muhammad; the Shi'ites in Ali or Husain. In keeping with the character of their sources, these thinkers set— to use Aristotle's own words—the dianoetic virtues above the ethical. Thus, e.g., in the 'Apologia of Philosopher of Philosophy, Husain ibn Ishaq the highest good is identified with the sound understanding. Wit and shrewdness, talent and sagacity, are put on a higher level than goodness and rectitude. Such, too, is the spirit which pervades nearly all the adab writings ('the doctrine of good or elegant manners') of the Arabs—often, indeed, mere compilations of extracts, and having hardly the slightest concern with ethics and morality.

A counterpoise to the extravagances of mysticism was provided by the supreme Aristotelian principle of the mean—the doctrine of the merynta, which was introduced into Islam at an early period. The Mu'tazilite philosopher al-Ishaq († A.D. 869) has summarized the characteristic feature of the section is the endeavour to invest religious duties with moral significance. Thus the daily liturgical prayers of the Muslims, which were a part of the work routine of each ruler and the monks, were held in the silent cloister or the monk's cell; the meeting of dwellers to cities with the inhabitants of the surrounding districts at the two official festivals of the year; the asking of pilgrims—each one in his lifetime—from all countries to Mecca: these things, as enjoined by the Prophet, are approved by the Koran as the universal love of mankind.

The conclusion (section sometimes divided, as vi. and vii.) discusses the health and sickness of the soul. The diseases of the soul are the eight vices—the afflictions of the four cardinal virtues—and they are divided into two groups: (a) the excess and defect of courage—handled in detail, its
extreme being presumption or foolhardiness, and cowardice or want of spirit, with their sub-species. But the actual vices arising with less thoroughness than the infections from which they spring—anger and grief, and their varieties.

Thus far Ibn Maskawih and philosophical ethics of the Mu'tazilites, features of the theory, i.e., its dualistic psychology and its hyperphysical morality, found special favour among the mystics, while, on the other hand, the scholars of the 'Abdith and the Ash'ar, as well as the dialectical theologians (the Mutakallim) and the rationalistic writers, gave the preference to the Aristotelian elements.

7. The Ethics of Ghazali.—The ethical system of the great theologian Abu Ḥamid al-Ghazali (A.D. 1058-1111) merits separate treatment, more especially as he is the final authority for orthodox Islam. In his case life and doctrine are one—rooted in his own personality. He was delivered from the snare of vain learning and worldly ambition by becoming convinced of the truth and moral power of Islam. In Islam he holds single-handed a position to the standing of that held by Augustine and Aquinas in the Christian Church.

Ghazali's moral philosophy is the synthesis of the various doctrines which we have passed in review. He is also acquainted with philosophical ethics and the criticisms of the cardinal virtues and of the mean. These he expounds in his Mizān al-anwāl, probably one of his early works, and we find traces of them also in his later mystical writings. Thus the narrow bridge which leads to Paradise (ṣīrat), and the scales in which the deeds of men are weighed (mizān), he interprets esoterically, as the true mean of virtue, just as many Mu'tazilites and speculative Sāfis had done. Ignoring the actual sequences, he maintains that the philosophers borrowed their ethical theories from devout Sāfis. Such might certainly be said of his own system, as it is saturated with and held together by the spirit of Sufism, and is intelligible only in the light of the mystics' doctrine of stages (the corporeal earthly life; the sensuous psychical intermediate stage; the spiritual celestial life; the being of God). Ghazali's theory is, in point of fact, a mysticism that vitalizes the law and doctrine of Islam, as is indeed clearly indicated by the title of his greatest work, Iḥyā' uṣūm al-dīn, i.e. 'the revivification of the religious sciences,' dealing with living religion; with religious life. Faith without works was in his view a dead faith. Religion must be an experience of the soul, and must manifest itself in works. 'He who knows and acts accordingly shall be called great in the kingdom of Heaven.'

The relation between faith and works, knowledge and action ('ilm and 'amāl), had formed the theme of much speculation before Ghazali's time.1 The philosophic school, and even the mystics, were all more or less influenced by the intellectualism of Greek ethics. Correct thinking was preferred before good conduct. Action, moreover, was restated as sentiment. Life, i.e., it was deemed of value only as a preparation for a higher life; while perfection or salvation in the hereafter was thought of as a state of pure knowledge, not indeed without joy, but certainly without action. With Ghazali, however, with the fourth part, the relation in question is complicated by the introduction of a third factor. Between knowledge ('ilm) and action ('amāl) he places the state of the soul (ḥād), a condition akin to emotion, and having a propensity to good or evil conduct. We have thus a sequence of three causally connected elements: knowledge gives rise to an affective volition, and this to the conduct action.

In connexion with these explanations, the extreme intellectualism (gnosticism) of the philo-

sophers who assert that knowledge without consequence is better than action without knowl-

dge of the grounds of action is assailed by Ghazali as sheer folly. Nevertheless, we trace the influence of the philosophical-dogmatic tendency. He denies the propitiation of himself for action in the consideration of knowledge, even though he there-

by means knowledge of the religious sciences. For him, too, the perfection of the pure spirit consists in intuitive knowledge, i.e., the beatific vision of God. In the first book of the Iḥyā' he fully discusses knowledge—the religious knowl-
dge that is profitable for the life beyond, and is 'a work of the heart; and in the second book he deals with the knowledge of religious doctrine as man's primary obligation. Religious knowledge, or true doctrine, is in fact the tree whose branches are the various states of the soul (akhirāt), and whose fruits are good deeds.

Ghazali agrees with the Ash'arite school in teaching that the merit of man's action lies in his approbation or assimilation (khtisāb) of Divine action. This is the theme of the same book, with its final coda, and

1 Cf. Goldziher, Kitāb ma'ānī al-našī', p. 54 ff.

The reader should note this enumeration, as in mystical writings such numbers are never without significance.
always been urged in the higher, and in the light of this fact Ghazâlî combines the distinction made by the jâhâr between faryâd (admonition) and fârâm (punishment) with the doctrine of stages presented by Neo-Platonic Sûfism. Thus, e.g., in regard to fasting, the fourth of the religious duties; in the first stage, as obligatory upon the faithful, it means abstaining from food, drink, and other sensual pleasures; in the second stage, it means giving up the enjoyment of love; in the second, it signifies refraining from the sins of the mind, e.g., the members of the religious orders, from the计量 of human time; in the third stage, attained only by the few, fasting implies the heart’s abnegation of the world and of all that is not God.

The principles of Ghazâlî are very characteristic of the peculiar nature of Oriental civilization. Neither philosopher nor devout mystic has in this sphere ever been able to attain fully to the thought of the highest ethical truths, that lacks the realities of autonomy, and of a super-personal law which, written on men’s hearts, is binding upon all. Although in the East an all but immutable law has been in operation for centuries, yet the frequent changing of dynasties and rulers have ever and anon been attended with intervals of anarchy. An imperative law is thus always associated in the popular mind with a particular ruler and those who represent him in secular or sacred things. There has as yet been little scope for individual freedom or personal initiative in any sphere of life. The populace submit to the secular power, or to the shâikh of an Order, or to the Hidden Imâm, or to some one who claims to be the Mahdî; for neither in social and political affairs nor in the sphere of religion and ethics can they do without a leader.

8. The work of Ghazâlî. — For centuries the instability of Oriental life has been hedged round by a remarkable stability of doctrine. Since the 13th cent. A.D., Islam has been content to study and expound the teachings of the Prophet, and the writings of the earlier students are constantly being re-issued in lithographed or printed editions—not as mere scientific curiosities, but as real stepping-stones to learning; and this is true also in the sphere of ethics.

In Ghazâlî orthodox speculation reaches its culminating point, and in the sphere of religious learning his influence is immense. But other factors contributed to a peculiar devotion of the faithful to men who point the way to their “adâd, teachers of the jâhâr did not discard their casuistry, while many philosophers and speculative Sûfis ignored the law in its outward form (antinomianism).

Ethics (ilm al-khitâb) could make no further advance in Islam as an independent science. People found their moral doctrine in the compendiums of the legal schools, or in some guidebook to the Sûfîte life, or in the manuals of good breeding (adâd literature). Books of the last-named class found special favour in secular circles. In Persia there exists a marked predestination for the teachings of the Sûfis, and, in particular, for the didactic verses of Sa’dî. An illustration of the way in which ethics has been incorporated with the adâd literature is found in the Adâb al-dumayq seal-din of Abû l-’Qâsan al-Mâwûdî (î. A.D. 1055).

This work, which was written before Ghazâlî’s day, is still used in the higher classes of Sûfism, where it serves as a treasury of quotation for the young. After passing the time-honoured axioms upon reason and knowledge, it gives a panoply of aphorisms, uttered by devout scholars, poets, and sages regarding religion, the world, and the soul. The section that treats of the secular life bears the impress of Aristotelian ideas, while the closing section, dealing with the morals of the soul, shows an ascetic strain, and singles out for special commendation such virtues as humility, meekness, veracity, and contentment. Its counsels are regarded in the same light as in the 11th cent., when Mâwûdî compiled them, i.e., as so many fine byways.

This continuitv of doctrine is certainly a remarkable fact. Even those who have in modern times tried to introduce reforms into Islam appeal for support to the ancient teachings.

This is specially true of the Wahhâbî movement, which sprang up about the middle of the 18th century; it is none the less regarding Islam to its pristine state, and denounced in puritanical fashion all innovation, the use of tobacco and similar indulgences, the luxury of cities, and the worship of saints. Of greater significance than this Arabian attempt to restore the past is the Ahmadi movement (see Bâb, BâbÎs), which took its rise about the middle of the 19th century. It was in
its origin associated with ancient mystical ideas, and trafficked in all manner of magical trumpery, sapping and destroying the moral sentiments of mankind, etc. It has latterly assumed a more progressive aspect, and now advocates the emancipation of women and the brotherhood of all classes and religions. To the present writer, however, it seems highly questionable whether the Báb’s mystic utterances or the actual teachings of the Bábí prophets are capable of effecting anything—in the face of Oriental despotism—on behalf of a free and active morality. Some look more hopefully to the revival of Mysticism teaching, more especially in British India, where its best-known exponent is Syed Ameer ‘Ali. This movement, however, presents few but of the typical features of Islam, and is scarcely to be distinguished from a liberal form of Christianity.

Here, indeed, we have it upon the characteristic feature of present-day Islam. The culture of Europe and America, with Christian customs and moral ideas in its train, is forcing its way on every hand into Muslim countries, and by means of education and the press is asserting itself everywhere, with the possible exception of Afghanistan and Mongolia. The movement is meanwhile too heavily confined to scientific and technical learning, which is assimilated in a somewhat superficial fashion; but whether it will prove fruitful, not only in the economic, but also in the ethical and the social and political, remains to be seen.

9. Moral life.—We have now dealt with the foundations and the growth of moral conceptions in Islam; and, although much obscurity still rests upon the subject, we have found it possible, with the help of the extant literature, to trace the main lines of ethical development. A much more difficult question, and one, indeed, that must probably remain in great part unanswered, is that concerning the actual moral life of the people. What was its character, and how did it compare with moral doctrine? Law and doctrine may often act as incentives to good conduct, but they are often simply the unconscious reflex of actual morality, and sometimes but the drapery which hides the hypocrisy beneath. Our main concern is the people’s actual mode of life, and our knowledge of this is very defective.

It has already been remarked that the sacred law, alike in its original form and in its later expansion, has to a great extent the weight only of an ideal canon law; as a rule, the people regard it as a suggestion. It most religiously regards the duties and the provisions regarding family life. The sentiments and practices of daily life were largely conditioned by racial character, by circumstances, by occupation—in a word, by the stage of civilization that had been attained by society or the individual. A detailed history of the morality of Oriental society—could such a work be written at all, and as yet there is an almost complete lack of competent preliminary studies in this field—would have to depict a vast variety of phenomena, such as, for instance, the various gradations by which formalism passed into permanent habituation, and, in daily life, the practice of confining the inhabitants to certain quarters, streets, according to their creed, nationality, or trade.

The fact that differences in nationality and occupation involve differences in moral characteristics, has been the subject of attention from ancient times. Thus, according to an early Muslim tradition, ‘pride and haughtiness are among the people of horses and camels, the shepherds among the farmers and herders, and modesty (nakia) among keepers of cattle.’ It is a still greater contrast, and one that pervades the whole course of Muslim history, that is between the predatory semi-nomads and the owners and leaders of city caravans, whose great concern is security of travel, and the inhabitants of the larger towns, whose very livelihood is dependent on the proceeds of trade. The largely aristocratic customs of the former are very different from the more comfortable life of townspeople. This more luxurious mode of life was condemned by official Islam, which, however, was long unable to resist the march of the merchant, who succeeded in assimilating the national character of the Persians to their own, just as they failed afterwards with the Turks and the Mongols. In the polemical literature evoked by the struggle between Arabs and Persians in the 2nd and 3rd centuries A.H., neither side failed to pass judgment upon the qualities of the other, and, as we might expect, each judged with all the bias of mutual animosity. Such estimates must, of course, be utilized with the utmost caution. It will be well also to be somewhat sceptical regarding the morés emanating from teachers of the law, as the class to which they relate. It is probable that every age and among all peoples to proclaim the utter wickedness of a world that did not tally with their sacred ideals, or submit to their personal capacity. Our best course will be to avail ourselves of incidental evidence from narrative literature, in historical writings, and books of travel; while for recent times we may have recourse to ethnographical works.

We generally find ourselves in the spriritual and volupturnous society of princes and merchants—a society whose basis is largely sordid gain, and whose life revolves round ‘wine, woman, and song.’ These people know the moral code by heart. They are also imbued with the mysticism of the poets, and with the philosophical tendency, but only by way of rhetorical embellishment. At a very early date, even in the holy city of Mecca, then at the Umayyad court in Damascus, and subsequently in the Abbasid city of Baghdad—and Cordova, Cairo, and other less important centres of Muslim culture—we find, under the mask of religion, a most worldly mode of life among the higher classes of society. Their morality had always much in common with the popular ideas expressed in fables and proverbs—i.e., it was altogether mundane. We shall search the fables of Laugman in vain for any mention of God or the hereafter. Death, which in religious and mystical life is always hazy and uncertain, appears, conformably to the common sentiment, in The Thousand and One Nights, as the destroyer of all delights. The enjoyment of life is at once the ideal of popular literature, and the chief concern of educated society. To acquire wealth in the easiest possible way—often by means of magic—and to squander it in pleasure, to go in quest of adventures as a means of regaining capital, are the great concern in most cases, however, as a travelling merchant who is a favourite of fortune: such were the visions which, designed originally to captivate the imagination, many endeavoured to realise in practice. Here,
in fact, we find a society that fostered the virtues of worldly wisdom, polite intercourse, tolerance, and business initiative, and at the same time practised the old and prevalent vices in more refined forms. The city of Damascus, in Muslim times, was the one where the Turks and the Mongols. In the cultivation of science and art, in the refinement of manners, in the systematic provision for the treatment of illness and for other public services, it was, as far down as the 12th cent. A.D., and in part even later, in advance of Christendom and the West. In intelligence and outward culture the Muslim showed himself superior to the Crusader, but whether he stood higher also in an ethical respect it is not easy to decide. What was morally good in him was nurtured and cultivated in secret, and its good name was never exposed to the scorn and ironical art of a Saladin, it was perhaps no longer good at all. But, be this as it may, it is certain that in a moral aspect the Muslim world, even as it exists to-day, is rather to be compared—to leave absolute standards out of account altogether—with mediæval Europe than with the conditions of our modern civilization. In order to put the matter in a clearer light, and in view of the fact that the opinion of the present day is two or three in considerable numbers to assimilate Western culture, it will be well to add a few observations on the point.

Various are the ways in which the many systems of religion and philosophy set forth the essence and the religious sanction of morality, there is one feature common to all, viz. the requirement that the individual shall, on the one hand, permanently hold in control the moods and pleasures of the moment, and that, on the other, by a process of constant self-expansion towards the ideal of humanity, he shall adjust himself to, and play a useful part in, the larger to which he belongs. Every stage of civilization has its rightful measure of stability and its appropriate sphere of operation—these being conditioned by the sway of the forces of nature without, and of the impulses of nature within; and under this sway, while the West had been making progress, the East has stood still, yielding to its changing destinies with a species of fatalism.

When we go a little more deeply into the popular literature of Islam, we recognize the elementary stage of its underlying morality. In the following paragraph a number of particularities are combined in a sketch which, though its dependence upon romantic sources, such as The Thousand and One Nights, will be obvious to all, may nevertheless help us to form at least a relative estimate of Muslim morality.

1 From the same source that fills so large a place in this literature as the phraseology of fortune. Just as the peasant lies at the mercy of rain and sunshine, so does the citizen depend upon the interest and will of his superiors in life. But his life has no security; the beggar of to-day is a king to-morrow, and contemning one who to-day drinks deep at the wells of pleasure may to-morrow renounce the world. There is a corresponding lack of perseverance: people live for the day and do not lay by. Then the law against taking interest stands in the way of a profitable investment of capital. The idea that the hours of work which are indispensable to success, is in itself mereious work, is an encouragement to idleness. A man's living and prosperity are supposed to be dependent, not upon work or saving, but upon wealth. Many are often reduced to want, but there are occasional festivals at which everything is surrendered to merry-making, and the savings of a year are squandered in a day. The absence of steady self-centred lives, which itself fed every wish, is lightly forgotten, and secrets lightly betrayed. Men cannot curb their curiosity, and so bring disaster upon themselves; and it is curiouslylicer to see them make adventuring journeys. They make gifts freely, but give in order to receive again. They fall in love at first sight, and trust their affections easily and frequently. Passionate weeping and lamentation alternate with extravagant rejoicing or helpless dimay. It is to be feared that many have a decided aversion in their looks and bearing—or, rather, of hiding their feelings; but, when called upon they are usually found to be in a more favourable opportunity, the ethical character of their emotion or of the eventual deed of revenge is not sufficiently altered. But the tends not, or at least to save the power to strike never fails to induce the impulse of the moment; he multiplies and beholds without any serious inquiry as to the guilt or innocence of his victims; and repentance often comes too late, and when it can no longer avoid. Great is as the v nakedness of judges and officials, their credulity and capacs are a more great. Mere arbitrariness, finding expression now in extravagant kindness and now in atrocious cruelty, appears to be the sole rule of a society so constituted, while patient submission is its supreme virtue. A typical representative of a class far from uncommon in the musulm State of mediæval times has been limned by Ibn Bâjiya in a single sentence: "From the one side was never received an alms, nor the corpse of one who had been executed." The potente referred to was Muhammad Tughî, Sultan of Delhi (1215-92).

The wider psychological explanation of these various phenomena (which are without significance even for the present day) is that human history had an opportunity of asserting itself. The most telling instance of this is seen in the band-exhausted vitality of the various dynasties. A dynasty usually begins with the rise of its founder, who settle and maintain their kingdom; then its energies begin to flag, and the heritage of the fathers is consumed in an eternity of decay. A dynasty such as that of modern Mogul, which, though now apparently solution, has lasted since 1659—a era in the history of Islam. In Islam no rule ever been able to maintain its power the slaughter of relatives and even. And, while it is true that the statesmen, with all their significance for the state of moral, finding also in mediæval Christendom, yet it is in Islam that the whole art of life, including the promises of revenge, of the whole art of life, has been made an art. Men as moralists, who than the merest approximation to mixed city populations, with whom they have as little in common as with the hard-working, all-enduring Egyptian fellahin. In Western Asia the Arab brigand comes in contact with Turkish and Persian merchants, among others; the Islam, who are among the most loyal subjects of the British Crown, are very different from the Africans, a people proud of their independence. In the Dutch East Indies are found the scaffolding of a community, which as the predatory and warlike Achehese; and many more instances of diversity might be given. Notwithstanding the common faith of these peoples, they do not lay by. Then the law against taking interest stands in the way of a profitable investment of capital. The idea that the hours of work which are indispensable to success, is in itself mereious work, is an encouragement to idleness. A man's living and prosperity are supposed to be dependent, not upon work or saving, but upon wealth. Many are often reduced to want, but there are occasional festivals

parities in Muslim countries. Slavery still exists, more particularly in the form of chumush and concubinage. The slaves, both male and female, are kept from motives of luxury and pleasure, they are relatively well treated. Such cruelties of capitalistic exploitation as we hear of in the annals of Great Britain or France, in the cases of the plantation system in the Indies and America, are seldom or never found in Islam. The Muslim owner frequently treats his slaves, and even his dumb animals, more cruelly than he does his fellow-men, and often with himself. Here, moreover, it is accounted a good and praiseworthy work to elevate slaves and then grant them their freedom.

The further division of Muslim society into classes is not everywhere the same. It strikes the Western mind as primitive, medival, or, at least, as pre-revolutionary. In India, for instance, Islam has not entirely abolished the system of caste. The inhabitants of cities in Western Asia were still segregated according to their various trade-gilds. An illustration is furnished by the membership of the first Persian Parliament, which by the constitution of the 5th of August, 1906, was to have the following denominations: (1) those of the princes and the ruling house (the only nobility in the proper sense); (2) those of learned men and students; (3) those of the merchant class; (4) those of manual laborers and peasants; and (5) those of the various industries—one member for each guild embracing from three to nine traders.

It is impossible in the space at our disposal, and especially in view of our dearth of knowledge of the morals of Islam, to deal exhaustively with the morals of all these peoples and their various social ranks. We shall, therefore, confine ourselves to a few general observations regarding Muslim life as actually affected by the moral code.

Islam lays upon its followers the duty of propagating—of active effort in spreading the faith, either by the peaceful methods open to merchants and traders, or, where possible, by the holy war. This demand has pronounced moral effects. For the Muslims themselves the result is twofold: on the one hand, sinster—in so far as an impulse is given to fanaticism; and, on the other, favourable—in so far as active virtus is sustained by a sense of pride and by the consciousness of belonging to a vast and effectively expanding organization. With regard to the masses, the influence of Islam is more methodical and peaceful. Every time that there is a disturbance, a disturbance is the result of a reaction against religious rule, which is anything but propitious. There are in all some 225 millions of Muslims; but of these about 150 millions live under the British crown, 20 under Chinese, 20 under Russian, 20 under French, and so on; while the Turkish empire, the Persian empire, the Indian empire, the Egyptian empire, and the State in Europe, is now being harassed on every side. It is possible, however, that the diffusion of Islam among lower races, like those of Northern Africa, or Asia, may prove effective in raising their moral conditions to a higher level.

Throughout Islam the religious law has a powerful influence in family life. Christian writers have usually a good deal to say about the Muslim form of married life—polygamy. The law permits any man who has the requisite means to have four wives, and as many concubines as he wishes. But it should be borne in mind that this permission is circumscribed in practice by the fact that the number of women is not unlimited, as also by the economic conditions, which allow only the prosperous to maintain more than one wife. Monogamy is in all branches of the society, and is practiced by the majority of townsmen. As a matter of fact, the practice of marriage has nothing like such beneficial effects as the facility of divorce, also sanctioned by the law. It is not so much the practice of having more than one wife at a time as that of frequently changing the wife that works great moral harm in Muslim society. The husband can put away his wife at any time and for any reason, provided only he repays her dower or gives her a compensation. This extreme liberty of divorce, which is certainly incomparable with all higher cultures, is therefore a negative advantage, and the result is the derangement of domestic relations and the neglect of the family.

In most Muslim lands the position of women is an inferior one. The Qur’an explicitly declares the superiority of men. Women are treated with respect, but are, on the other hand, much more addicted to the magical arts and to the practice of visiting the graves of holy miracle-workers. The latter custom, however, has in many cases no deeper motive than visits to the hazard of the baths.

The Muslim reckons the preservation of his own life as one of his primary duties. Suicide is not even prohibited by the Qur’an, is as also the killing of one’s neighbour, though the latter prohibition is not so scrupulously observed in Islam, as elsewhere, more by circumstances than by religious law. The ordinary offences are not due to monetary rapacity or defective memory, rather than to evil will. In some respects the religious law, when it is not hypocritically evaded, tends to dlog the wheels of association and to break the spirit of the nation, and the last of the Madr—-the latter being in the main only observed—-mills against a settled and unalterable aim, much as giving, as was said above, encourages idleness. The theme of penitential interest is either enjoyment or the abstinence from, while a man daily work, or is regarded as having any ethical value. Praying, or begging, or even being insane is thought of by many as providing a more excellent career than working or trading. Study of the law is frequently prized more highly than obedience to it. In the greatest Muslim cities, like Cairo, and elsewhere, many continue to study the sacred sciences till old age—not, however, with a view to becoming useful members of society, but simply in order to win a higher place in Paradise.1 By way of instructing the faithful as to the right disposal of their wealth, the Cairo newspapers recently published the wills of a physician—a genealogist—and a shahik of the Azyar—who died in 1906.

He left one-third of his estate among the poor; a granddaughter received 3000 piastres; his books were bequeathed to his two sons, and his clothes to the poor students learned men of the Azyar.

An example of the false analogies to which the Muslim is led by his fatalistic tendencies. In God may be seen a phenomenon of the principle of insurance. A shahik of the Azyar says in a facetious manner, that life and fire insurance is to be regarded as gambling, and as contrary to the spirit of the law.

One great obstacle to the development of social morality in the East has been the time immemorial custom of the official life. Both in Persia and in Turkey, However, voices are now being raised in favour of a purer public service. Thus a celebrated punishment of 1906, the following words from his pulp: “We have, thank God, the best law in the world, which is the Qur’an, and we do not deny the law of the Europeans. But what we might well take from them is their method of appointing and superintending officials, and of collecting taxes. We have a much better way, one that needs no further explanation.”

The incapacity of governments and officials has often permitted greater freedom to prevail in the East than in the West. In various ways, and sometimes doubtless in the interests of justice and morality in a higher sense, the dead hand is compelled to move again. In the hands of devout teachers of the law these foods have been used as a weapon against the State, and the State accordingly encourages their secularization, though, as we might expect, the process is seldom carried out without fraud. Another consequence of the systematization of morality that prevails in Oriental life is that many people to conceal the fact of their wealth, as they would conceal heretical opinions. The majority, however, are either calm, the patronage of the rich, or the money-rabbi, and large retinues of servants.

The middle class, who devote themselves by preference to trading—indeed, who would regard nothing else—have generally a bad reputation for self-interest and avarice. This is probably an exaggeration. The people of the East, confined to Islam. It cannot be denied, indeed, that in the East the policy of fixed prices prevails still less in the Southern Empire, and that very many Orientals have been swayed by the spirit of avarice to falsehood. But to say that commercial honour is hereby unknown, or that the Muslim is not reckoned at all generally, is mere slander, though it may be admitted that the Muslim, like the majority of mankind, judges of truth and falsehood from the standpoint of immediate advantage rather than from that of morality.

The official moral code has less to say about the means by which a man earns his living than about the way in which he enjoys, or refrains from enjoying, his gains. But how does the matter stand in actual practice? One feature that forces itself upon the eye at once is that many morally indifferent com- munities are under a religious law that is the most severely, and are observed of all. The laws against luxury and intemperance are much less strictly adhered to. As regards luxury, indeed, some measure of disbelief is the only thing that is permitted, and it is that yet cannot commit sin; and to women, who are lost in any case; while the men are at least not allowed, in theory, to reside in brothels. Many Muslims produce a favorable impression by their unaffected manner and their temperate manners. The prohibition of the tambourine and the liquor-stores is in force, but it must be granted that with many Muslims hashish, opium, and other in- nocentakes are not only known that alcohol is consumed by many opium-smokers in Persia and Turkey, and there is also a considerable amount of wine-drinking. In India the habit of opium keeps many men from heaven, and frequently from the point of view, the Muslims of the Celestial Kingdom are said to be much more addicted to this vice than the Chinese masses.

With these insufficient references to the morals of contemporary life in Islam this article must draw to a close. The question as to the ethical significance of Islam for the future is one easier asked than answered. If the sacred law continues to remain a living force, and if the moral ideals thus embodied still prove helpful to peoples at a lower stage of civilization, it will in other circumstances act as an obstacle to moral development. Among more highly civilized peoples, Islam must either degenerate as an effective moral force, or adapt itself to new conditions. It must come to realize— as in many quarters, indeed, it has already realized—that the laws of Muhammad and the tradition were given in the view of the primitive conditions of an earlier age. Will the modern Muslim community, in ascertaining to this idea, be able to raise itself above the Qur'an and the sunna without surrendering Islam itself?

ETHICS AND MORALITY (Parsi).—I. The place of ethics in religious system of the Avesta.—The religion of Zarathushtra, qualified by the Avesta and the Pahlavi books, is in the fullest sense the word a religion of morality. With the Parsis, Indian, we see the in a manner a moral interest in the take the place of the sacrificial and philosophical interests of the Brâhmans. This moral interest corresponds with the political aptitude of the Persians themselves; but the Zarathushtra ethics has it real foundation in the religious system of the Avesta. This system we know as a dualistic one (see DUALISM [Iranian]). Already in the theology of the Gâthas—the oldest part of the Avesta, originating perhaps in the time of the Prophet himself or in that of his nearest successors—we hear of the two opposing Spirits, the pure and good Spirit of Ahura Mazda and the evil and impure Angra Mainyu (Ahriman; q.v.).

'Of these two the wicked Spirit chose to do the most evil things, the holy Spirit chose Righteousness and those men who in performing acts of purity please Ahura Mazda (Gatha xiv. 22).'

'And, when the two Spirits met, they created as the first things Life and Death as the final end. What the wicked and the Good have done, the thighs of Death (Gatha iv. 2).

The conception of these principles of Life and Death is elaborated in the idea of two real empires, the one being the dominion of Zoroastrian, the other that of Ahriman. As these two empires are not divided according to the natural division of material and spiritual, they rule together in Nature, and in bodily phenomena as well as in spiritual, as do life and death, good and evil. The motto of Ormazd's empire is 'The furthering of life (fedat-gaitha), and the words are almost a war-cry in the combat; the angels of Ormazd, the Avesta Spenta (q.v.), 'Immortal Holy Angels,' are always said to 'further the living,' that they may not wither or decay; while, on the other hand, the chief of the Evil Spirits is called Pouramahkara, 'Full of Death.' From a formal and moral point of view, the two empires might be defined as Purity and Impurity—Purity containing all the vital forces of the world, Impurity all the forces of death. It is the sacred duty of mankind, and constitutes his moral righteousness, to uphold the forces of good; and so we see purity, holiness, righteousness appearing as identical conceptions, and all included under the one idea. This idea is the fundamental idea of the Zarathushtra religion. Personified, it is the angel Aes Vahitta, 'The Best Righteousness'; and, as the summum bonum, Aes Vahitta gives its name to Paradise (=New Pers. Badât). The final aim of religion, the regeneration of the world, corresponds with this idea of righteousness. It endeavours to make the world absolutely pure and righteous, free from every defilement of evil and death.

This dualistic idea, found already in the Gathas, is developed further in a mythological direction in the Pahlavi book Bûndehsh, where the Evil Spirit attempts to destroy what the Good created. He is here seen as conquered, but he is allowed to continue in the world for a time, in order that it may be perfectly manifest how bad the evil is, and that good deeds and a good life constitute the only right in the world. This tolerance of evil is to last for 6000 years, after which period the final processes leading to the victory of Ormazd begin. These 6000 years make up the period of the actual world, and so this world-period is naturally a time of struggle between the powers of Good and Evil (cf. AGES OF THE WORLD [Zoroastrian]).

The later Avesta (Vendidad, I) describes the beginning of that struggle as a twofold creation—Ahriman always creating evil, in imitation of each good thing created by Ormazd. So Nature itself becomes twofold—good things and pure creatures always mingling with the wicked inventions of the Evil One. The world of good is divided into good and evil, and so is it in the world of men: Ahriman is the chief not only of Evil Spirits, but of unbelieving men. The great Persian, Indian, we see in the former a moral interest take the place of the sacrificial and philosophical interests of the Brâhmans. This moral interest corresponds with the political aptitude of the Persians themselves; but the Zarathushtra ethics has it real foundation in the religious system of the Avesta. This system we know as a dualistic one

VOL. V.—33
Ornament is to struggle for his cause, to work out his ideas in the world, to realize the good and pure in Nature, as in the life of man. Thus the Good One and his followers struggle. Whether against the passions of their own hearts, or against the passions of the people, the final victory will depend on this collaboration of God and man. No other religion has made the work of man a condition of the ultimate success of the Divinity; and, because the system of Zarathushtra is based on the truth that a unique spirit idea enters into all, we must truly say that in a unique sense it is the religion of morality; duty being an inherent religious necessity, and moral actions the inevitable consequence of the religious spirit.

2. Morality as a struggle against the evil spirits. —This morality is, however, no morality in our modern sense of the word, the immediate struggle against the evil spirits forms a large part of the duties of man—especially of his sacrificial and ritual duties. For the priesthood the actions involved in the performance of the cult are the most important, but this cult has its meaning in the struggle against the evil spirits, and as a system of purifications to expel the evil spirits found in Nature and in human life. Against the evil spirits the priests are armed with a mighty weapon, consisting of the pure elements, and especially of the holy water, which is always kept burning as an ever active power of purification. In ordinary human life a great multitude of observances are needed for keeping the evil spirits at a distance; among these, cleanings are the most important, for evil is always considered as a form of impurity. At the same time the cleanings have the power of expelling the evil spirits; and many performances that would commend themselves to us as being practical and useful may, according to the Persian ideas, in reality effective because they expel the indwelling evil spirits. Water, for example, has a real anti-demonic efficacy, and not merely a hygienic or aesthetic value, as in our modern view. Again, after an illness all the bed-clothes must be cleansed with the utmost care, not so much to obtain clean bed-clothes as to free them from the indwelling evil spirits. Every sickness and the natural states of organic life, such as menstruation, are understood to pertain to the great realm of death and devils. Every dead thing belongs to Ahriman, is impure, and impurity must be removed. The ceremonies of cleansing are needful when one has touched a dead dog, a dead man, or any other dead body—only, however, if the creature, when living, belonged to the realm of purity.

Thus the customs of mourning imply at every step the expulsion of evil spirits, the purification of the house, the family, and the district where the evil spirit of Death has dwelt. The Parsees pray laying the dead bodies of men and of dogs to the 'Towers of Silence,' where they are exposed to the birds of heaven, in order that earth, fire, or water be not defiled by the burning or other destruction of the bodies. But, on the other hand, the corpses of evil men or of noxious animals convey no impurity, since by their death the demon has left them (Vend. v. 33-38; cf. DEATH AND DISPOSAL OF THE DEAD [ Parsi], § 3).

3. Morality as an art of sacrifice. —Besides the actual deuce of living creatures, every state implying a poverty of life or a tendency opposed to life, in Nature and practice, is considered as a mere form of death, and as needful, naturally, of the action of evil spirits. Therefore, unfruitfulness, cold, destructive heat, withering, noxious substances, blight, weeds, harmful insects, etc., all belong to the empire of Ahriman, and are to be driven out. Thus religious duties go hand in hand with the work of civilization. In the time of Zarathushtra this civilization referred mainly to a nomadic and an agricultural community. The pious man ought to treat his cattle well, to nourish them, and not to beg for meat from sacrifices and this care for the cattle led in later Parsism to the classic symbol of pious morality. Besides these virtues of the nomad we hear much in the later Avesta of agricultural duties: the cultivation of the fields, cutting of canals, causing the roads and houses, of buildings of houses, and manufacture of agricultural implements are all important and necessary duties of the faithful. The weeding of the fields and the destruction of noxious insects and of meritorious deeds, tending to obliterate the boundaries of Ahriman's empire. The duties of an agricultural life provide the religious ideals of the Persians, and in the religious texts we continually meet with pictures drawn from agriculture which are used to illustrate the holy life.

To the question where the earth enjoys the best fortune, Ahura Mazda naturally answers: Here, "Where most sacrifices are made, the laws obeyed, and praise given to the Gods." Then follows the second answer: "There it is, where a builder builds a house and a priest and a king, who lives according to the natural life, where cattle and bohiness flourish, and food and dog, and wise and children, sufficient in abundance." And the third answer is: "This is it, where the believer grows most corn and grass and fruit; where he waters the dry soil and drains the damp" (Vendishist, ii. 1-4).

For the Parsees marriage is a holy vow, marrie, waiting for an husbandman, like a ripe maiden who goes childless, long years, as an husband, but which the soil with both arms will she bring riches, as a beloved spouse brings her child to her husband" (6b. 24:1).

With this desire for cultivation goes the representation of its religious meritoriousness and of its holy power. "Who sows corn sows holiness," is a saying of the Vendishist, which also declares: "When the barley is arranged (for threshing), the demons begin to sweat (for fear); when the mill is arranged (for grinding), the demons tremble; when the meal is arranged (for leavening), the demonic spell is removed; waiting for an husbandman, like a ripe maiden who goes childless, long years, as an husband, but which the soil with both arms will she bring riches, as a beloved spouse brings her child to her husband" (6b. 24:1).

4. Higher ideas of morality. —The norm of ethics is based upon the principle of utility contained in the Avesta. But that utility has in many cases an ideal character, and leads, at its height, to a real ethics even in our sense of the word. The productive activity of man is always highly esteemed. Nothing may be done that might curtail life in any sense. Therefore we never find any ascetic elements in the usual observances of cleanings. But every act that could diminish the fertility of man is strongly prohibited. Chastity is a necessary duty; and every form of unnatural sexual relation is forbidden and severely punished, as being under the power of evil spirits and leading not only to impurity but to the destruction of life. In the later contest with the Manicheans in Persia, the positive character of Zarathushrian ethics is always evident, and a chief point in the policy of the Zarathushtra or ethics was the resistance against the various forms of asceticism, such as celibacy, fasting, self-flagellation, and other forms of mortification of the flesh.

Besides the consideration of roads and buildings, the religious duties go hand in hand with the work of civilization.
only as pointing to social instincts necessary to the life of the community, but as being also personal qualities inherent in the highest type of Persian manhood, and giving to it its highest value. The truthfulness praised by Herodotus (i. 186) as one of the elements in Persian education includes, without doubt, the duty of speaking religious truths; so at least the art-nikāda vāzē ('true-speaking') of the Avesta is to be understood. In the name of God, might not directly the Avesta, at least in the ethics of the Pahlavi books; and here we note also how a city civilization in Persia leads to a higher moral state than that of an agricultural utilitarianism.

The inward qualities of man—the tender emotions, benevolence, thankfulness—are mentioned in the Table of Duties in the Dīn-dā Maināging-i Khrah, ch. 57. Of the thirty-three duties mentioned in that chapter we choose some characteristic ones: benevolence, truthfulness, thankfulness, contentedness, to further the welfare of the good and to be a friend of all men, to marry one's sister, to adopt children, to labour industriously, to preserve the capacities and goodwill of every one, to keep maliciousness and untruthfulness far from one's mind, not to show rancour, not to be libelous, not to be quarrelsome, not to touch the goods of travellers, and the unproven, not to give way to anger, to exercise self-control, to resist laziness, to be happy oneself and to further the happiness of others, to help the good and to protect against the evil, to be careful not to speak untruth, to be scrupulously careful in keeping one's word, to open one's house to the sick, the poor, and the traveller. This is, as we see, a composite scheme of ethics, where a very refined moral orthodoxy is combined with remnants of relatively primitive social customs—e.g., the marrying of a sister, which in the times of the Achemenians was regarded as a mark of the highest aristocracy.

5. Morality.—Parsiism being in this extreme sense of the word a religion of morality, the community naturally found a special task in upholding morality and educating the people in good works. The daily life of the priests was, of course, much taken up with ritual matters of cleansing and exorcism; but these rites included many moral and pedagogical elements—e.g., to insist that it is the duty of men to cleanse themselves from every defilement, as it is their duty to expel the devil by means of helpful works. It was the office of the priests directly to oversee and govern these multifarious exercises, and they had also to instruct husbands and wives in their duties and to punish those who were not fulfilled. The name of the priest who had the latter function, vrānas varē, 'he who works out obedience,' is very significant of the duty, and to 'work out obedience' he used a scourg called by the same name.

The system of penalties belonging to this sacred pedagogic is codified in the moral law of the Avesta, the Vendidad, whose name, 'given against the demons,' hints once more at the characteristic identification of demonology and morality in the Avesta. The idea of sin which usually meets us in this book is, therefore, essentially a juristic one. The pekā-tarn, as the sinner is called, is he who deserves corporal punishment. The conception of sin as an inward state of mind is hardly found in the Avesta.

The devout guilt is not conceived of as sin, but, from a religious point of view, as disbelief; or, in the extreme case, as worship of the evil spirits. The fulfilment of all duties is contained in the Two Good Works (Humēta, hobita, kuvresita).

Every pious man or woman may produce a great store of these three for gaining the bliss of heaven, and very holy persons, such as priests, may sometimes produce more than is needed for their own salvation. This overplus of good thoughts, words, and works is stored up in heaven as a thesaurus operum supererogatorum, to be distributed among the souls that are not sufficiently well provided for.

6. The Final Judgment.—It naturally follows from this system that the Final Judgment will turn upon the question of good works. The Zarathustritian eschatology is based on two stages of Judgment. The one corresponds to the judicium speciale of Christian theology, and is a scrutiny of individual souls; the other, the judicium generalis, is a trial of mankind as a whole.

The former is the trial before the tribunal of Mithra, on the mountain Chahāt-i Dāštī. There the souls will be weighed in the balance of the spirits, which renders no favour on any side, neither for the righteous nor yet the wicked, neither for the lords nor yet the monarchs. As much as a hair's breath it will not turn, and has no mercy, and bin who is a lost and a monarch it considers equally. In its decision, with him who is the least of mankind' (Dīn-dā Maināging-i Khrah, ii. 1200). (Tr. West, SBE xiv. 265.)

Even the soul that is acquitted is punished for its evil works by the angel Asha; then it may pass the Bridge of Judgment, Chinvet, which leads to heaven. The earth is divided from the极大 of the gulf of hell beneath (see, further, Bridge, ii. 2 (c)).

The Final Judgment is carried out on the Last Day, when the bodily resurrection takes place, and the souls, blessed and wicked together, rise again to join their bodily bodies. This judgment is an immense ordeal, in which resurrected mankind will be required to pass through the molten metal that will overwhelm the whole earth. Here the true character of existence and the remainder of life's task is fulfilled. The true fire will burn very fiercely, to the good it will appear like lukewarm milk; but in all cases was the same state of purity and holiness which was the original state before Ahriman introduced its defilements.

This Last Judgment, as we see, has much of the character of a natural process of cleansing; but in relation to the individual the formal element in the procedure appears; indeed, the idea is founded upon a principle of merciless retribution. The good Mithra, as the duty of superintending the procedure; the supreme God Ahura Mazda has no part to play at all, the idea of mercy being absolutely excluded from the accomplishment of human destiny.

Nevertheless, the religious community has the power of releasing men from the consequences of their guilt (1) by means of the Paetē, the confession of sin made at the moment of death (see Expiation and Atonement (Pars) ); and (2) by sacramental means, viz., putting the holy juice of haumīa into the ear of the dying. These dispensations are possible only in virtue of the overplus of good works at the command of the community.

Reviewing the whole field, we note the extremely formal and rather juristic character of the Zarathustrian ethic, while the Persian genius for utilitarianism and things practical always enters into the scheme of righteousness and justice. In the individual life, this ethic approves industry, self-control, and rectitude; in social life—righteousness, regularity, and social acceptability. This ethic is an abstract stiffness that will not accommodate itself to life, and whose irrational consequences are often inimical to life. The Zend-Avesta, monotonous and God-given, leaves no room for the intermediate stages of real life, for the individual and spontaneous states in the soul of man. The Persians cared little for
the emotions of disinterestedness; even in the religious feelings we feel too often the want of lyric elements; on the contrary, we always feel the heavy burden of the necessity. In accordance with this, 'religion' in the Avesta is called 'law' (deintu), and the Persians could not distinguish between the two ideas.

ETHICS AND MORALITY (Polynesian, Melanesian, and Malayan).—The character of the Polynesians has been painted both in the brightest and in the darkest colours. The truth seems to lie between the two extremes, and an explanation to be found in the fact that the Polynesian is a child of nature, and, like all children, under the sway of each passing emotion. It was the better side of the Polynesian character which led the early voyagers. Their lightheartedness, their ceremonious courtesy, and their abstinence from petty quarrels led their European discoverers to fancy that there was a golden spot in the future. Yet the same childish superficiality which filled them with unrestrained joy could fill them in an instant with melancholy which might not stop even at suicide. Nor was their lightheartedness always ingenuous; it often formed a cloak for falsehood and treachery. In many of these cases the Europeans were not free from blame, provoking, by their violence and licentiousness, such revenge as the weaker natives could fairly give. The more correct side of the Polynesians themselves, so that wars were conducted by ambush rather than by open attack. One of their leading characteristics was revenge, which was often conceived for years with deep secrecy until a fitting opportunity occurred for its gratification. This principle of revenge, which, it must be borne in mind, is reckoned a virtue rather than a vice among many peoples, frequently led to the vendetta. Thievory and robbery were considered commendable and skilful when practised against foreigners; yet among themselves or towards those who had been adopted into their midst as brothers, the Polynesians evidenced a high code of honour. In like manner, they possessed the primitive virtues of hospitality and generosity, though these qualities, like their honesty, suffered from the coming of the whites. Indolent and idle at work, the Polynesians were, nevertheless, devoted to war; yet flight was not regarded as a disgrace. The Tahitians regarded wounds in battle as marks of awkwardness and foolishness. Their wars were conducted with the utmost cruelty and with pitiless barbarity towards captives, though, on the other hand, there was in New Zealand and Tonga a noble recognition of a prisoner's valour. Closely allied with their bravery in war was their pride, even though this sometimes degenerated into vanity. In the use of spirituous liquors the Polynesians were originally extremely temperate, but their licentiousness, especially in Tahiti, was almost incredible. The police system was by no means lacking among the Polynesians. Noble deeds were admired, and the Tongans struck the keynote of hedonistic ethics when they said: 'After a good dinner a man should sleep, and if he were otherwise disposed, he should sleep his sleep or be content. Shame for theft or other unseemly deeds was by no means rare, and the ethical sense grew steadily higher with ascent in the social scale. The position of women throughout Polynesia was comparatively high, although they were not considered equal to men. Ill-treatment was rare, and women were often admitted to the councils, possessing an influence over the laws of their tribes. Pre-natal chastity was unknown, excepting in the higher classes, and the utmost indecency in conversation and jests prevailed throughout the islands, especially in Tahiti. After marriage, chastity was not strictly preserved, though occasional. The Tahitians were not averse to taking advantage of the weakness of their wives, and they married and fathered children more readily than was the case with the Polynesians. On the other hand, those who were unfaithful to a husband by the blood-covenant might regard his wife or wives as their own. From this must be distinguished a husband's possession of his wife, especially to Europeans. Unnatural and secret vices, as well as incest, were disgracefully common, all combining with the general licence to aid in the decay of the Polynesian race. Parents met with no want of esteem from their children, yet, despite the prevalence of infanticide and abortion, they were devoted to those who were allowed to survive. The status of slaves was toilsome, yet relatively merciful. Punishments consisted of fines, and the penalties being death and mutilation, while the lex talionis was common throughout the Polynesian Islands, and extended not only to the criminal but to the family, although pecuniary compensation was not unknown.

The character of the Melanesians was ethically inferior to that of the Polynesians. Thus theft was extremely common, especially in Fiji, where it was punished only when committed against compatriots. In like manner, the Melanesians were notorious for their falsehoods, except that one's own deeds were never denied. Proud and revengeful to the last degree, they forgot no injury, seeking retribution by murder and by black magic. They were cruel, but were cowardly rather than brave. On the other hand, the Melanesians were very susceptible to civilizing influences, and in their courtesy and hospitality were little inferior to the Polynesians.

The position of women was less elevated among them, however, since wives were obliged to do the heavier sorts of work and to surrender the greater part of the adornments to the men. Their condition was particularly deplorable in the Fiji Islands, where they were in the absolute power of their husbands, and were frequently maltreated. Melanesian women were far more jealous than Polynesian sisters, even the unmarried girls observing strict chastity. In the Fiji Islands sexual relations were unknown before the young men had reached the age of eighteen or twenty—a restraint which in its time checked the shameful procris which prevailed in Polynesia. In Melanesia strong affection prevailed, for the most part, between parents and children, and they were carefully educated, although they had no ethical training. The practice of infanticide was shockingly prevalent, two-thirds of the children in Fiji being killed as soon as they were born—often by people who made this their profession; girls were the chief victims, because they were more likely to be deserted. Abortion was also extremely common; yet, if an infant survived the first day, it was safe, and was treated with all tenderness. The immorality of infanticide and the murder of the un Petticoat is not the abstract. The belief that human beings lived in the future life in the age and the estate in which they were at death. The aged, or those afflicted with long and tedious illnesses, were either taken care of and in their lifetime or by abandonment. The sick and aged themselves desired to die thus, and it was accounted a tribute of love for sons to put them to death. Whether the practice of cannibalism may properly be considered
as appertaining to ethics is somewhat doubtful, but it is spreading under the prevalent idea that this characteristic is prevalent throughout both Polynesia and Melanesia. (See Cannibalism.)

The characteristics of the Polynesians and Melanesians are most clearly described in Tahiti and Fiji respectively. The one people was facile, mercurial, social, relatively cultured, kind, and chivalrous, but marred by an all-pervading and encraving sensuality; the other was cruel, treacherous, and inferior to the kind of virtue in almost every respect save that of sexual purity.

LOUIS H. GRAY.

ETHICS AND MORALITY (Roman).—

Sources.—In scarcely any field of Roman life are we so conscious of the paucity of our sources as in that of ethics and morality. For the earliest period we seem at first sight fairly well supplied, for we have, or seem to have, a multitude of anecdotes and figures from which to draw picture of the virtuous early Romans, but in the later and decadent period of antiquity took such retrospective satisfaction. But, once we have caught up with modern scientific progress in the matter of Roman history, these figures, and even the legends of the early Roman race, are reduced to the mere folk narrative and are unscientific. Modern theories of anthropology and primitive psychology take their place. With the beginning of Roman literature our situation improves; but this literature is to a high degree dependent upon Greek models; and, even where it reflects Roman feeling, the latter is merely that of the intellectual classes. Nor does the advent of Greek philosophy, with its formal teaching of ethics, succeed in any considerable sense in enlarging our vision. But, during the Empire at least, the multitude of inscriptions and our knowledge of Oriental cults diminish our darkness.

In spite of these obstacles, the following outline seems tolerably sure; in it an attempt has been made to sketch the evolution of the moral attitude of the Romans from the earliest times until the conquest of Christian ideas. It does not attempt to trace the development on Roman soil of ethics as a philosophical discipline. This is not possible, simply because no such development ever took place. Roman philosophy, to be sure, dealt profusely with the subject of ethics; but it took its origin from Greece, not merely at the beginning, but in every individual attempt, during all its history. It does not, therefore, represent so much a Roman development as the reflection, among Roman writers, of a development which took place in Greece and the Hell-speaking lands.

The ethical development of any people is a continuous process; but, though the process is continuous, it is, nevertheless, subject to change of speed, and may be accelerated or retarded by circumstances. The acceleration is usually due to the pressure of outside influence, while a lack of foreign impact often tends to quiescence and lethargy in the moral sphere. In Rome's history, between the foundation of the city and the accession of Constantine, there are three such accelerations: the first (in the 6th cent. B.C.), caused by the coming of the Etruscans; the second (in the 3rd cent. B.C.), caused by the victories of the Punic wars; and the third (in the Julian-Augustan age), caused by the influence of Greek philosophy and Oriental culture.

1. The period before the coming of the Etruscans.—In the phraseology of the orthodox history of Rome, this is the period of 'the Early Kingdom.' In it we are confronted with a series of pictures of heroic virtue. The chief reason why these stories have been discussed is, that the morality of the early Romans have used these stories as evidence, thus unwittingly spreading under the prevalent idea that this characteristic is prevalent throughout both Polynesia and Melanesia. (See Cannibalism.)

In the sphere of religion it is relatively easy to trace the effects of this patriotic instinct. But its effects were also perceived in the moral sphere. The chief example of this is the extension of the rights of Kin to those who have no kin.
The mass of accumulated power must be put to a purpose. The fulfilment of this purpose became a duty. Thus virtus adds to virility the idea of value, and the patria takes its place alongside the family as the object of patriotic ambition. But the new state of affairs continued until the end of the Second Punic War, or, in other words, until the beginning of the 2nd cent. B.C. It is scarcely an accident that at the opening of this 2nd cent. we have the remarkable words of the old Catu in the introduction to the treatise, de Agri Cultura—words which seem to sum up the whole ethical situation. Speaking of what their ancestors (maiores nostri) thought, he says:

And when they praised a man and called him good, they praised him in this fashion, that they called him a good farmer or a good tiller of the soil. And he who was thus praised, they considered to be praised indeed. For from farmers are begotten the strongest men and the bravest soldiers. The action which has added to it conquest; and the whole ethical system gradually adjusts itself to this new valuation. Henceforward, actions are good or bad, not simply as they assist or retard the progress of the State, but also as they further or retard the progress of the State.

3. The last two centuries of the Republic.—The Second Punic War and the wars of the 2nd cent. B.C. brought to Rome great material prosperity. Riches increased with astonishing rapidity, and large private fortunes became less and less uncommon. At first these riches were solemnly and frugally invested in lands, but such investments served only to increase the problem, by increasing the riches themselves. Thus began the spending of money for luxury, and, later, for mere extravagance. But, as the rich grew richer, the poor grew, if not correspondingly, at least considerably, poorer; and, in any case, the gulf between the two extremes of society grew open more widely. The effect of riches and of poverty was in so far similar that each alike begat in difference to ideis. The simple life of the fathers was impossible for either class: for the one, because they were choked with riches; for the other, because they were throttled by poverty. Thus the fashion in art was not about two decades after Cato’s death before a man was ‘good’ according to the extent of his riches—the essential bona—rather than because he was a good farmer or a good citizen. That was already true which Cicero says (de Rerum Fam., II. 31): ‘In their ignorance of virtue, they call those the “best men” who live in riches and plenty.’ Similar phrases are found a century and a half earlier in Plautus (Curculio, 479; Captivi, 385); and, though here they doubtless go back to Greek originals, they could count upon an answering echo in the Roman audience. The commercializing of ethics was the inevitable accompaniment of the general commercializing of human life. The greater maxims of severe frugality and patriotic zeal were not entirely forgotten, and they lived on with considerable power among the now despised farming classes; but gradually, at least, good manners and poverty were incommensurable; and the favourite phrase of Cicero, ‘all good men’ (omnes boni), referred in actual practice to respectable well-to-do citizens. Certainly, in Cicero’s informal moments, when he was not in the mood to express his real feelings, for example, in his correspondence, it is so used (ad Att., viii, 1, 3).

But, in spite of their apparent profligateness, the last two centuries of the Republic, by this very luxury and self-indulgence, were working out an ethical salvation. By a strange psychological antimoncy, through self-indulgence ethical individuality was born; and in the reaction from the depths of sensuous luxury we have the new and severe ethic of individual moral responsibility, which is one of the great epochs and lastperiod—the Empire to Constantine.

4. The Empire until Constantine.—The result of the general development of ideas which characterized the century since the beginning of the second Empire, was such a condition of scepticism in the realm of theory, and of sensuous materialism in the world of practice, that a moral revolution could not fail to follow. This new idea of morality was based upon the concept of the individual, and his responsibility. It was, doubtless, assisted in its development by the ethical theories of Greek philosophy, which now began to be popular in Rome; but it does not owe its rise entirely to these theories. The influence of Oriental cults was, at least among the masses, stronger than that of Greek philosophy. But both these influences worked side by side; and, although they were based on entirely contrary principles, they seem to have lived together without jealousy or interference. Thus we have the two great crusades for moral regeneration: that of the philosophers, especially the ascetic preachers, proclaiming the doctrine that moral regeneration comes from knowledge, that to know the truth is to do it, and, conversely, that sin is merely ignorance; and that of the priests of the various Oriental cults (of Magna Mater, Isis, Mithra), proclaiming that men are saved from sin and its consequences, not by knowledge, but by faith. It was the latter idea especially which affected almost all classes. The attempt to bring philosophy to the masses was destined to fail; but, where Stoicism failed, Mithra conquered. The world has seldom witnessed a more strenuous moral atmosphere than that which existed during the first two centuries of the Empire. Perhaps the most powerful proof of this statement is to be found in the fact that even the Oriental cults themselves were purified and spiritualized by their residence in Rome. See MITHRAISM.

Thus it came to pass that the Christian ethic, radically different as it was in many respects from that of the other Oriental religions which survived, not only was itself the best that could be associated with the accepted morality of the day; and its teachings, which would have been almost entirely unintelligible to society in the time of Sulla, were in many respects commensurable with the world of Trajan. There were, however, points of disagreement; and, by an unfortunate accentuation of certain Oriental interpretations of the Christian ethic, the old pagan ethic of patriotism engaged in conflict with the whole Christian system. The conflict raged for centuries, through Julian on to Gratian and to the altar of Victoria, and on to Alaric’s capture of Rome, until in Augustin’s City of God it reached at least a partial solution.

JESSE BENEDICT CARTER.

ETHICS AND MORALITY (Teutonic).—The term ‘ethics’ can be used in this connection only in its general sense of ‘ethical ideas’ or recognition of moral obligations, and by no certain that no idea of a system of ethics had ever suggested itself to the early Teutonic mind.

1. Sources of information.—No race has left so much literature behind it with so little of a merely didactic or theoretical nature. All the heathen Teutonic peoples, so far as we can judge, seem to...
have been intensely interested in conduct, but mainly as revealing character, not as illustrating abstract principles of right and wrong. In ancient Teutonic society there was no class set sufficiently apart from the ordinary business of life to survive it as a whole, like the poets of early Greece or the Druids of Celtic heathendom. The poets, lawgivers, and saga-tellers were fighters and farmers as much as everybody else, and even the priests were not a caste apart—except possibly in England—but only chiefs with priestly functions superadded. Perhaps it is significant that it is in early Anglo-Saxon poetry that we find those traces of expression on moral issues, as well as a facility in the expression of ethical ideas, which are so noticeably absent in all other early Teutonic literature; but it is most probable that these characteristics are the result of the early conversion of England to Christianity.

Most of the foreigners who had any opportunity of observing the manners and customs of the Teutonic races were missionaries, to whom the ethical ideas of the heathen made an appeal, so that we can depend very little on outside judgments. From an earlier date, however, the "Germania" of Tacitus gives an admirable outline of the social life of the early Teutonic people. A.D., and everything we know of these races in later times goes to show that Tacitus' observations on their code of morality were in the main correct. Still, in the absence of all open utterance on ethical ideals by the people themselves, we are driven back on the more or less unconscious self-revelation of the old hero cycles and sagas, in which the more choice of subject betrays where the moral interest of the writer lies. It is necessary for us to bear in mind that the period covered is a long one—ten centuries—and that our sources usually reflect the ideas of the ruling classes only.

2. Teutonic virtues—Such virtues as were vital to the continued existence of the society naturally ranked first in public opinion, and of these (1) the first and foremost was courage. Lack of courage is the one unpardonable sin.

Tacitus ("germ., vi) tells us that a German who abandons his shield in battle has committed the basest of crimes, and is subject to death. The sacred rites, and that the man who adds that many, after escaping from battle, have ended their lives with the saber. No less emphatic is the curse pronounced by the Teutonic poets, especially in the Songs of Beowulf the elder, "Hateson Beowulf," and it, too, ends significantly: 'Death is better for every well-beloved chief who has lived his life. (Beowulf, ed. Harrison and Sharp, 4th ed., Boston, 1901, line 2891 f.)'

Many a good man doomed himself to death at the hands of his superiors to escape the superior force of enemies because he could not bear the ignominy to the idea of seeking safety in flight. Even treachery to friends and kinmen can be condoned or understood, but no one will listen to a justification of an act of physical cowardice. Many tales reveal how far courage takes precedence of all the other virtues. The faithfulness with which Gunnar and Hognn lay their foster-brother Sigurd, in the Volsung story, is wiped out in the eyes of posterity by their heroic death at the court of Ath, and their still more heroic acceptance of defeat. The mind unshaken by adversity is the object of the Teuton's highest admiration. An almost American Indian stoicism underlies that grim humor and acceptance of death or wounds which strikes us so keenly in the Northern stories.

"Thormod, St. Olaf's scald, dragging a death-arrow from his breast after the battle of Skidkast, knew it as he dies and observes: 'Well hath the King led us, fat am I yet at the heart's root.' (Heilungsbringe, Morris-Magnusson's tr., 1902-5, ii, 442.)" When Thormod's descendant Gjaun hall in Iceland seeks to see if he is within, he returns mortally wounded to his companion, who asks Gjaun if he is there. 'You can learn that,' he says, 'what I found out is that his halberd was at home,' and falls dead ("Gerson-Sklanda, ed. F. Jónsson, 1905, ch. 77").

""The forbidding death of friends or kinmen is also admired, but the betraying of feeling under such circumstances is readily condoned, even in the aged, though we can feel the saga-writer's admiration in the tale of the old Viking Thorarin, who learns of the slaying of his son with apparent phlegm, with only a casual inquiry as to his defence, and all the while fumbles with the uncertain hand of age at a dagger with which he attempts to avenge his son. 'Enduring of toil, hunger, and cold, whenever fortune lays it on them,' says Geoffrey of Malatera of the Normans; and every expedition in the undecided Viking ships must have been a training ground of such qualities. Anglo-Saxons, in the poem on the battle of Maldon, supplies us with those two lines which are a very epitome of Teutonic ideals of courage and endurance:

'Our souls be steady, our hearts the higher,
Our mettle the more, the more our might be minimish.'

(3) But in modern eyes perhaps the noblest of the early Teutonic virtues is the supreme loyalty which inspired the followers of any chief or king. A man could choose whom he would follow, or whether he would attach himself to any one, but, once his choice was made and he had become the man of some great, he was bound by his allegiance. Loyalty transcends all other duties, and will lead men to arraign the gods, and defy Fate itself, as they fall in the last rally by their leader's side, like Bjarki in the story of Hrolf Kraki, as told by Saxo. Tacitus and the Beowulf concur in saying that it is a reproach for life to have survived the chief in battle. Even in the 12th cent., when the old Teutonic virtues were dying out, the young Icelandic Art. Tórunn, makes a shield of his body for his Norwegian lord, standing weaponless between him and his enemies. This is self-sacrifice born of courage, but the idea of loyalty fostered other virtues besides that of courage—virtues which otherwise would hardly have flourished on Teutonic soil. Tacitus tells us that the chief fights for victory, his vassals fight for their chief that to assuage one's own brave deeds to one's chief, to increase his renown, is the height of loyalty. The self-forgetfulness, the abnegation involved can be gauged only by those who realize that personal fame was the highest ideal of the Teutonic warrior. Loyalty was not confined, however, to the warriors by profession, but permeated the whole fabric of Teutonic society. Every little Icelandic farmer expects that his 'kindred men,' his friends, will cheerfully sacrifice their lives on his behalf, and the obligation even extends to the chance guest, so that many a Norwegian merchant in Iceland lost his life in a quarrel that was not his. The call of loyalty is yet stern in one case on record. Ingimund the Old has been slain by a base and unworthy hand; and, on receiving the news, one of his old shipmates declares: 'It is not fit for the friends of Ingimund to live,' and falls on his sword. His example is followed by another of Ingimund's old shipmates, who will cheerfully sacrifice their lives on his behalf, and the obligation even extends to the chance guest, so that many a Norwegian merchant in Iceland lost his life in a quarrel that was not his. The call of loyalty is yet stern in one case on record.

Ingimund the Old has been slain by a base and unworthy hand; and, on receiving the news, one of his old shipmates declares: 'It is not fit for the friends of Ingimund to live,' and falls on his sword. His example is followed by another of Ingimund's old shipmates, who will cheerfully sacrifice their lives on his behalf, and the obligation even extends to the chance guest, so that many a Norwegian merchant in Iceland lost his life in a quarrel that was not his. The call of loyalty is yet stern in one case on record.
in his house, at the bidding of his father, Harald Fairhair, because Egil had been addicted to drink and thence to breach of duty and ‘molestation of churchyard’, says Heimskringla (Morris-Magnússon’s tr. 1954).

(6) Truth was highly esteemed virtue among the Teutonic race. Tacitus ( Germ. xxii.), calls them ‘a race without natural or acquired cunning’—an estimate which may be partly inspired by the natural attribute of a sophisticated race towards a barbaric one: for, in the earliest Scandinavian chronicles already quoted calls the Normans ‘gens astutissima,’ and the somewhat cynical Edda poem Hávamál has no hesitation in advising its hearers to flatter a false slanderous friend and to conceal enemies (12, 45). But Saxo, the early historian of the Danes, says that ‘the illustrious men of old thought lying most dishonourable’; and it may be said that the sagas reveal a high ideal of straightforwardness in general. It is characteristic of the Northern trend of thought that there was no sin in a slaying openly confessed, but an indescribable busines in a secret or a midnight slaying, which was qualified as murder. To lie to a friend would certainly have been thought a business, and we meet with individuals who would rather risk their lives than impair their self-respect by lying. The accounts of the early Norwegian kings and their relatives reveal that flattery, at least, was not one of the best traits of the Teutonic character. Great sanctity attached to oaths and promises of every sort, and nothing was held to excuse breaches of faith, though instances, especially of truce-breaking, are found even when ordered down and the sagas oftener after than before the introduction of Christianity. To the recognition of an obligation to strict veracity in the recital of stories we owe much of our knowledge of ancient Teutonic customs.

(7) Modesty, strangely enough, entered into the ideal of the perfect warrior in Iceland, and boastfulness was regarded with more contempt than censure. In the epics of the heroic age, however, boasting is freely indulged in.

So far we have been dealing with qualities or obligations which are still recognized as virtues and duties in modern ethical systems. We catch glimpses of a time when it was an absolutely binding obligation, but in all Teutonic States the system of his principal compensation had been adopted before historical times, to mitigate the recognized evils of blood-feuds. But among a race which, from the time of Tacitus onwards (Germ. xiv.), rather than the idea of getting, it was hardly to be expected that every one should be willing to ‘put his (slain) kinsman in his pocket,’ as the saying went. The Icelandic sagas give us a vivid picture of the havoc wrought by blood-feuds that the custom of vengeance in the early history of that country is a matter of common knowledge, but its persistence in country districts in Germany is not so generally realized. In many parts vengeance was held to be obligatory, not only on nobles, down to the 16th century.

Thus our source tells us that in 1577 a Holstein peasant named Grannan, who had more or less accidentally slain another, was killed by the deceased brothers with 48 wounds. These brothers were proceeded against in a court of law, but were never condemned. They, as late as on the 28th of November, to have been customary for the relatives to hang up the corpse of their slain kinsman under their roof until they had acquitted themselves of the duty of vengeance. In England, so early Christianized, the current ideas concerning this duty are quarterly revealed in a verse made on King Edward’s death in 1067:

"Him would not avenge
A kinsman’s kinman
him has his heavenly father
greatly avenged." (Gest. Sæmundi, ed. Anna 976 [Gonne’s tr. 1909]).

The idea that vengeance alone can wipe out an insult was prevalent, and has persisted to this day in the Continental attitude towards duelling (q.v.)
(9) In the matter of sexual morality the heathen Germanic races have always had a high reputation since the time of Tacitus, and on this point Christian priests have added their testimony to his (see Sect. 167). This is not otherwise capricious: the marriage code, says Tacitus, is strict, and no part of their manner is more praiseworthy. Almost alone among the Teutonic peoples, a divorce by consent with one wife excites a very few among them, and these not from sensuality, but because their noble birth procures for them many offers of alliance ('Germ. xvi. 17).{25}

'Their marriage code,' says Tacitus, 'is strict, and no part of their manners is more praiseworthy. Almost alone among the Teutonic peoples, a divorce by consent with one wife excites a very few among them, and these not from sensuality, but because their noble birth procures for them many offers of alliance ('Germ. xvi. 17)."

Chandler's correspondence is equally unknown to men and to women (ib. xix.).

This description needs little modification to fit the customs of a much later age. It was the practice to King Harold Fairhair to have several wives, but it must be especially noted that this polygamy involved no harim, for it seems that for the most part each wife continued to live with her own family or in the part of the country where she was born. The Icelandic sagas indicate that divorce was easily obtainable—apparently on trifling grounds; but the fates of Brynhild and Sigurd, of Gudrun and Kjartan in the Lay of the Fate-Sagas, of Íjón the Hildate Champion, and Oddny, show that the persons wrongly nated make no attempt to throw off the marriage bond in order to be free to marry another—presumably because such action was impossible. It is not entirely out of jealousy that the Icelandic Gudrun brings about the death of the man she loves, but because only so can she rid herself of the degradation of preferring another man to her husband, and of the continual temptation of that other's presence. She prefers his death to dishonour.

Tacitus tells us of the punishment of a faithless wife; but later sources, Icelandic and Norweigan, mention the worry for the woman though they speak of a heavy fine to be exacted from her lover. The old Norwegian laws make the ecclesiastical fine for conjugal infidelity the same for either sex.

(10) Perhaps the most remarkable feature of the ethical ideas of the Teutons is that the ethical ideal was the same for both sexes. Women do not fight, but the wife, according to Tacitus, does not "stand apart from aspirations after noble deeds or from the perils of war, but is her husband's partner in toil and danger, destined to suffer and to dare with him alike in peace and in war (Germ. xvii.); and easier he tells us how the dauntless courage of the women has been known to rally warring forces in battle (ib. viii.). For Helen of Troy, for the Irish Deirdre, beauty and an unhappy love have been the stimuli to bitter and useless flight to fire the Germanic imagination women have needed these and more; the character that shapes destiny, the courage which does not blench before responsibility, the truth which seems to evade consequences. Such are Brynhild, Gudrun, Hervor, Svanhild, and the Anglo-Saxon Hildegryth of the Waldere-fragment (C. W. M. Grein, Angelsleben. Bibliothek, i. [1885] ff. It is perhaps significant that Germanic hero-legend exalts no woman who has yielded to a dishonourable love. The Icelandic sagas not only attribute these greater virtues to women, but expect them to urge the love of fair play and a high sense of honour on their men-folk, if these fail to realize their public responsibilities.

Grískelda is no Teutonic conception. In one minor detail a sharp line is drawn between the sexes: drinking to excess at feast is no reproach to men, but is unheard of in women.

3. Ethical motives and sanctions.—(1) If we regard the ethical ideas of the Teutonic races as a whole, the point that strikes us is that though the ideal of generosity has struck moderns as blameable, and it originated in an epoch when wealth was of little use save to attach warriors to one's cause. And if the Teutonic ideal of the community was strongly felt as a deterrent to crime, far more did its praise act as an incentive to virtue. From the time of their supremacy in Europe until their racial consciousness was merged in their citizenship of the Roman Church, the quest of glory called forth much that was best in the Teutonic race; and in judging it as a motive we must remember that there has barely lasted a renown—a fame that extended as far as the Teutonic race, so that the selfsame hero might be sung from the north of Africa to Greenland. We cannot
wonder that even the cynical Hävementi is inspired to the noble verse:

'Chattels die, kinmen die,
Von fame dies never.'

'But fame dies never.'

For if the formula has won it worthy 'Utea,' 79.

(4) But the deepest, most potent sanction of morality was an internal one: the sense of personal integrity, the sturdy self-respect, the fear of that sense of degradation which was probably as near as the heathen Teuton ever approached to the sense of sin.

Literature.—Tacitus, Germania; the Older Edda (B. Sjömen's text, Helge, 1859-1901; an English tr. by O. Bray, London, 1907; and in Vigfusson-Powell's Corpus Poeticae Boreale, Oxford, 1893; the Idothic Stages (some of which have been translated by Morris Magnussen, in the Saga Library, etc.; Norska Saga and Gida Saga have been translated by O. W. Daseet (Edinburg, X), the last ed. 1900; Gida, 1860); and Laxdale Saga, by A. G. Press (London 2nd ed. 1900). O. Jöse, Detente Heldnesjon, Strassburg, 1899 (Eng. tr. by M. Bentneck-Smith, London, 1902); the older epic. Little attention has been paid to the subject by modern scholars. A. Oirk's Nordisches Geisteleben, Heidelberg, 1898, is an able and sympathetic work by a man who has had so much occasion to know all known data bearing on the inter-relations of the several members of the human family, regarded not as independent groups, but as mutually related and interwoven unions, a result which anthropology has been able to ascertain by the close connexion between these divisions; and the most important problem which it has to solve is whether all races really constitute not distinct species, still less genera, but only varieties of a single genus and are ranging from about four to sixteen or even more—or certainly not yet extinct. But the tendency of modern thought is undoubtedly towards Mono-genesis, which postulates not only one such distinct group and a single division, but four major or relatively fundamental divisions separately evolved in four corresponding geographical areas reached by migration from a single cradle-land. A return to the old notion of the ‘ooman and his stress’ to the sober teachings of Linné, in whose Order of Anthropomorphe man appears as one genus with one species, ‘cujus specieis Europeas obius, Americanus refusenas, Asiaticus fames, Africicus ingenester’ (Syst. Nat.), ed. 1758, p. 3).

This scheme, forming the solid basis of all rightly directed ethnological studies, is frankly accepted by Sir William Flower, in whose Sub-Order of Anthropomorphe the (Linné's varietates) constitute the fifth and highest family, coming nearest to, but still independent of, the Similde, that is, the four groups of the so-called man-apes; Gibbon, Chimpanzees, Gorilla, Orang-utan.

These Homo, with their numerous diverging and converging sub-forms, are the proper study of Ethnology, which thus seeks to determine their origin, primal home, antiquity, and early migrations, their distinctive physical and mental character, social and cultural developments, and, especially for our purpose, their religious notions, not as separate units, but as interconnected members of the human family.

2. Specific unity of mankind.—(a) Perhaps the most convincing proof of common descent from one stock is afforded by what Broc calls their Eugenics, the complete and permanent fertility of unions between all races inter se. Such crossings between the highest and the lowest and all intervening grades have been places in which the physiological test has been so universally applied that there are no longer any pure races, except perhaps a few isolated groups, such as the Andamanese, the Negritos, and some of the New Oceanic negritos. Miscegenation is everywhere the rule, and all peoples are now essentially hybrids, representing both diverging and converging types of the original prototypes, which must now be regarded as mainly ideal. Accordingly in the Stone Ages we are intermingling of long-heads from North Africa with short-heads from Asia, resulting in the present Europeans. In recent times these Europeans migrating to the New World have formed fresh amalgams with the aborigines; and the Hispanic-American and Lusitano-American Mestizos now number little short of 50,000,000, and in many places (Mexico, Salvador, Colombia) the rather unexpected result that the fertility among half-breeds is considerably larger than among full-blood women (F. Boss). The Bovianers of British Guiana form a vigorous half-caste community, 'descendants of the old Dutch settlers by Indian squaws' (Henry Kirk), and most of the present South African Hotentots are also Dutch and native half-breeds. To realize the full force of this argument, we have only to consider how impossible such a result would be on the Polygenist assumption. Distinct human species originating in Pliocene or at least early Pleistocene times could not now be racially fertile, and their unions would serve only to illustrate the opposite law of konogenesis.

(b) Specific unity is further shown in the prevailing physical and mental uniformity of all peoples. As these points will again engage our attention, it will suffice here to remark with E. B. Tyler that 'all tribes of men, from the blackest to the whitest, the most savage to the most cultured, have such general likeness, in the structure of their bodies and the working of their minds, as is easiest and best accounted for by their being descended from a common ancestor, however distant' (Anthropology, p. 5).

But, it is urged on linguistic grounds, languages differ specifically and are so diverse, that four major or relatively fundamental divisions separately evolved in four corresponding geographical areas reached by migration from a single cradle-land. And, it is here that the argument runs into a fallacy, for it is at once become clear, when we reflect that the stocks in question are reckoned not by tens or scores, but literally by the hundred, so that quod minus probat nihil probat. In the United States and the Dominion of Canada alone such an enumeration of sixty stock languages; and as on this hypothesis, each of these represents a stock race, we should have in North America alone some sixty specifically distinct human groups, though de facto all are admixed very much alike, scarcely distinguishable physically or mentally one from the other. The facts relied upon merely show that race and speech are not convertible terms, that there is no arguing from one to the other. This may now be taken as axiomatic in Ethnology.

3. Origin: centre of dispersion: migratory routes.—Specific unity may thus be removed from
the sphere of speculation, and accepted as an established fact with all its far-reaching consequences. A first consequence is that man, being one, had but one cradle, whence he peopled the earth by migration. This cradle has been sought in all quarters of the globe—in the Arctic regions now covered with ice, in the Austral lands now flooded by the Indian Ocean, in the Eastern and Western hemispheres, in Asia the reputed officina gentium, in Africa, and recently Wijsenburg in Europe, and more particularly in Scandinavia (South Sweden). But none of these lands has made good its claim, and the tendency now is to look for the centre of origin and dispersion in South-East Asia, where it breaks away into the insular Malaysian world.

The latter view, which for the present at least may be said to hold the field, has acquired a certain consistency from the discovery made in 1892 by Eugène Dubois of some distinctly human remains embedded in the late Pliocene deposits of the Solo river in the Trinil district of East Java. These highly fossilized remains of Pithecanthropus erectus, as they have been named by the finder, include a femur, two molars, and portion of a skull, and are regarded by Manouvrier, Deniker, Hepburn, and most other competent judges, as undoubtedly those of a human creature. The capacity of the skull (950 to 1000 cubic centimetres) shows that it could not have belonged to any of the allied anthropoids, none of which even now exceeds 600 c.c., while the perfectly human femur makes it clear that this Javanese prototype could already walk erect. In the accompanying diagram he is seen to diverge, not from any of the living Simians, but from a common anthropoid stem having its roots far back in the Miocene; and that is the now commonly accepted view regarding the line of human ascent. The same diagram shows that, as regards its mental powers, as indicated by its cranial capacity, the Javan "man" (the expression covering a pre-glacial, two or more inter-glacial, and a post-glacial epoch)—thus coincides with the first migratory movements, which may be conceived as advancing and receding with the spread and retreat of the ice-cap, but were all completed, if not during the inter-glacial, certainly in the post-glacial (early Pleistocene), epoch. That is to say, the earth was first occupied by a generalized Pleistocene prototype, which northerly and southerly specialized into the four fundamental varieties in the four above-mentioned geographical areas. The main divisions of mankind may thus be regarded as respectively descended in their several zones from four undifferentiated Pleistocene ancestral groups.

This view of human origins at once removes some of the greatest difficulties that systematists have hitherto encountered, and at the same time accounting in a reasonable way for many phenomena which must otherwise remain inexplicable. Thus the four varieties, springing independently from four generalized Pleistocene ancestors, become each specialized in its own domain, and need no longer be derived one from the
other—black from white, yellow from black, and so on,—a theory which both on physiological and on physiographical grounds has always presented all the difficulty of any anthropologist. Indeed, no anthropologist has yet seriously grappled with the insoluble problem presented by conditions which, as we now see, have no existence. To suppose that the highly specialized group, as say, originally black, migrating from continent to continent, became white in one region or yellow in another is a violent assumption which can never be verified, and should on reflexion be rejected. However as a group, if placed in an environment quite different, it would probably have died out long before it had time to become acclimatized. The fundamental racial characters are the result of slow adaptation to their special surroundings. They are what climate, soil, diet, heredity, natural selection, and time have made them, and are of too long standing to be effaced or blurred except by miscegenation, a process rendered possible by primitive union.

5. Early works of man: Old and New Stone Ages. By descent from common Pleistocene ancestors is also more readily explained by the sura- 

unting resemblance, amounting to identity, which is everywhere presented both by the earliest skeletal remains of primitive man and by the first rude objects of primitive culture. Such are the skulls found in West and Central Europe, in Egypt, California, Brazil, and other parts of South America; the stone implements occurring in prodigious quantities in Britain, France, North and South Africa, Somaland, India, the United States, Argentina, Fuegia; the social and religious institutions of primitive man in Australia, Melanesia, Africa, North and South America. Certain Australian skulls seem cast in the same mould as the Neanderthal, the oldest yet found in Europe. Sir John Evans, the first judge on this subject, tells us that rude stone objects brought from the most distant lands are "so identical in form and character that they might have been manufactured by the same hands. On the banks of the Nile, many hundreds feet above its present level, implements of the European types have been discovered, while in Somaliland Mr. Seton-Kerr has collected a large number of implements which . . . might have been dug out of the drift deposits of the Somme and the Seine, the Thames or the ancient Solent" (Inaugural Address, Brit. Assoc., Toronto, 1883). If this be true, and it is found and are equally well illustrated in the religious notions of the Melanesians, the West African Negroes, and the natives of British Guiana (see below).

To the Pleistocene or Post-Pleistocene, answering roughly to the Quaternary of French writers and the Diluvium of the Germans, has been assigned a duration of from 200,000 to 300,000 years, and this may be taken as the measure of early man and all his works. It covers two distinct periods of cultural growth, the Paleolithic or Old Stone, and the Neolithic or New Stone Age, these being so named from the material, chiefly flint, employed by those in the manufacture of their weapons and implements of all kinds. As many are still in the primitive state, it is obvious that here Old and New do not imply time sequence absolutely, but only relatively to those regions, mainly Europe, North Africa, and America, where the subject has been most thoroughly investigated. Even in these regions Old and New do not always follow in chronological order, since the two stages still flourished side by side in some places, as, for instance, amongst the North American aborigines. The distinction between the two periods is based especially on the different treatment of the material, which during the immeasurably longer Old Stone Age was merely chipped, flaked, or otherwise roughly worked and polished. Hence experts assure us that they can always tell a paleolithic from a neolithic, although a warning note has recently been sounded, among others, by A. Thilenius, who, speaking from personal observation, declares that "toutes les formes, même les plus archaïques, ont été fabriquées simultanément avec les formes plus nouvelles, à l'époque de l'âge de jade, 'aux derniers jours de la pierre polie' (Hommage à Boucher de Perthes, Paris, 1904, p. 13). Nevertheless, Sir John Evans' great test of a paleolithic—the bulb of percussion— still holds good, while it is safe to say that no well finished and polished neoliths were produced in the early period.

Other distinguishing features of Palæolithic and Neolithic culture are here tabulated in parallel columns for more convenient comparative study:

**Old Stone Age.**

**Food:** at first mainly vegetable, then animal also; mostly if not eaten raw; obtained by hunting and fishing only.

**Cultivated plants:** none.

**Industries:** limited to the stone of stone and bone implements, the former never ground or polished, but of progressively improved types, and later embellished with artistic carvings, chiefly of the mammoth, horse, and other contemporary animals.

**Monuments:** none in the strict sense; no houses, graves, or burrows at first; habitation chiefly caves and rock-shelters; no permanent stations except for working stone implements.

**Speech:** at first perhaps inarticulate, later inarticulate, later oratory.

**Social groups:** the family, later the clan reckoning kinship through the female line.

**Religion:** generally supposed to be non-existent. But carvings in later Palæolithic times suggest funeral rites. The painted figures also late discovered by M. Rivière and Capitan in caves of the Mad- 

lenian epoch (see below) seem to afford evidence of religious notions at that time. M. Sal- 

mon Rendah is inclined to think that some, especially of the animal figures, may have served as tokens to the dead, in which case the use of torches, and the fact that such figures may have exercised a magic influence. If so, this would imply the existence of religious ideas in still earlier times.

**Letters:** none, unless certain pebble-markings found in the Museum of Anc. caves of M. d'Anzi, are regarded, with M. Pilet, as a kind of crude writing with ideographic, if not phonetic value.

**Religion:** generally supposed to be non-existent. But carvings in later Palæolithic times suggest funeral rites. The painted figures also late discovered by M. Rivière and Capitan in caves of the Mad- 

lenian epoch (see below) seem to afford evidence of religious notions at that time. M. Sal-

and that then, after a blank of unknown duration, a fresh start was made with the sudden appearance of a new and higher culture, as if dropped ready-made from the clouds. Evidence is now accumulating for a show that the Neolithic era was not arrested but continuous throughout the whole of the first cultural era, which thus tended to favourable localities (South France, the Riviera, North Africa) to its ultimate spread, by the second, Bay that it is not always possible to draw any hard and fast line between the Old and New Stone Ages.

The Old Stone Age is itself divided into a number of successively progressive eras, the most generally accepted of which, at least for Europe, are: (1) The Chellean, so called from Chelles on the Marne, where were first found some of the very oldest and rudest chipped flints, now often called coliths. (2) The Mousterian, named from the Cave of Mouster on the Vézère River, Dordogne, which has yielded some improved but still rude spear-heads, scrapers, and other flints of a simple type. (3) The Solutrian, from the cave at Solutré near Mâcon, whence come the famous " laurel-leaf " and some other patterns, showing an immense advance in finish and variety, still unexplained. The Chellean and Mousterian diverge thus, and the Solutrian and Mousterian diverge thus. (4) The Madeleian, from the rock-shelter of La Madeleine, above the Vézère, representing a very long inter-glacial or pre-glacial period of steady progress, during which was developed quite a Paleolithic "school of art." Here were first brought to light some of those remarkable stone, horn, and ivory scrapers, gravers, " harpoons," ornaments, and statuettes with carvings on the round, and skilful etchings of seals, fishes, reindeer, horses, mammoths, snakes, and man himself, considerable numbers of which occur also in many other stations in Dordogne and elsewhere. The remains found in the Placard Cave, the Charente basin, as well as in the Balsi Rossy caves at Mentone on the Riviera, together with the numerous rock carvings of the neighbouring Ventimiglia district, show distinct interminglings of Old and New Stone Age types, and thus the "hiatus" vanishes for ever.

The Palaeolithic Age gives the measure of the antiquity of man. The great division remains supply the proof of that antiquity. Many of the Chellean coliths (Gr. βοός, " dawn," sc. of culture) are found in situ under conditions and in associations which bespeak very great age. They occur, for instance, in the undisturbed glacial drift (sands, gravels, boulder-clays) of the Ouse, Thames, Somme, Seine, Nile, and other rivers which have since scoured their beds down to depths of 50, 100, and even 400 feet. In Tunisia many have been found under a thick bed of Pliocene limestone deposited by a river which has since disappeared. The now absolutely arid and lifeless Lileyan plateau is strewn with innumerable worked flints, showing that early man inhabited this formerly fertile and well-watered region before it was reined by the slowly changing climate to a waste of sands. Many objects of human industry have been recovered from Kent's Hole and other caves beneath great masses of stalagmite, while others again are found associated with the now extinct "Danaton." Post-Palaeolithic changes have taken place even in the comparatively recent New Stone Age, which acquired its greatest development in North Africa (pre-dynastic Egypt), in the Agamia lands (pre-Mycenaean culture), in Italy, Central and West Europe, the British Isles, Scandinavia, and South America (Tiwanakuco)!

In Scotland the Neolithic era lasted long enough to witness the formation of the Caernavon highlands, now stand 40 or 50 feet above sea-level, but then formed the bed of a sound or estuary flowing between North and South Britain. Hence Sir W. Turner's suggestion that after the separation of Britain from Europe in the second, Bay that it is not always possible to draw any hard and fast line between the Old and New Stone Ages.

6. Pre-Historic and Historic Ages.—The Neolithic era, to which a duration of from 50,000 to 100,000 years has been ascribed, merges in an ill-defined Pre-Historic period, when stone was gradually superseded by the metals—first copper, then bronze, loosely iron, as correctly stated by Lucretius (de rer. Nat. v. 1286-7):

a Posterioris fervi vis est arteque reperta,
Et prior seri erat quam fcere cognitum usum."

To these Pre-Historic times may perhaps be referred most of those popular myths, demi-gods, eponymous heroes and traditions which even to this day survive and have supplied the copious materials which were eagerly seized upon and worked up by the early rhapsodists, the founders of new religions, and later legislators (Homer, Hesiod, Zoroaster, Mani, Solon, Lycurgus).

7. Antiquity of the primary types.—With these names, shadowy though most of them be, are ushered in early historical times throughout the Aryan world, while in Hamitic and Akkado-Semitic lands more certain and far more ancient records are supplied by the dated monuments, the rock and mural inscriptions and clay tablets of the Nile Valley, South Arabia, and Mesopotamia. With the revelations made by archaeologists in these earlier seats of the higher cultures the Historic period itself is constantly receding farther into the background, and we are now assured that the Mesopotamian city of Nippur already possessed a history some 8000 years ago. Thus is approached the period of 10,000 years which may have to be assigned to the Historic Age before the archeological exploration of Egypt and Babylonia is exhausted. From the pictorial and plastic remains here brought to light, as well as from other early sources, it is now placed beyond doubt that the antiquity of the Egyptian race had long since then time already been fully specialized. Even in the Neolithic era the European type had already been established, as shown by the essential remains of the ' Cromagnon race,' so called from the cave of that name in Périgord where the first specimens were discovered. Professor Virchow has described a skull of the early Iron period from Wildenroth in Bavaria, which had a cranial capacity of no less than 1555 cubic centimetres, and was in every respect a superb specimen of the regular-fashioned, long-headed North European. In Egypt, where Oppert finds traces of a well-developed social and political organization dating back to over 13,000 years, Professor Petrie discovered in 1897 the portrait statue of Prince Nebkhetkaf of the 4th dynasty (3700 B.C.), a man also described as of "European features." Still older is the portrait of Eshangaga, who reigned over the Babylonian Akkad about 4050 B.C., and had quite regular features which might be 'either Semitic or eurasiatic, what changes have taken place.'

Thus we have documentary evidence that the Carcaoui, that is, the highest human type, had already been not only evolved, but spread over a wide area (Europe, North Africa, Mesopotamia).
some millennia before the new era. The other chief types (Mongol, Negro, and even Negro) are also clearly depicted on early maps, so that all the primary groups must have already been differentiated at least in the Neolithic times.

8. Nomenclature.—As these main divisions will hereafter be used freely as a basis for study, it will be well to give a summary statement of the more salient physical and mental characters (such as may be regarded as true racial criteria) by which they have been distinguished throughout the strictly Historic period. Very slight to which extent of what turns out to be purely conventional, it should be noted that the Ethnops, Negro, and Black are taken as practically synonymous, answering roughly to Linné’s Africains, but including also the allied Caucasian blacks commonly called Papiassins (Papuans and Melanesians), and Australasians, with the now extinct Tasmanians. The Ethnops division thus forms two distinct sections—the African or Western, and the Australasian or Eastern, now separated by the intervening waters of the Indian Ocean (see above). This remark applies also to the Negrit division, of which there are likewise formed (Athentic and Oceanic Negroes). Ethnops and Yellow are similarly equivalent terms, as are also American and Red, where ‘Yellow’ and ‘Red’ are to be taken in a somewhat elastic sense, as in Linné’s corresponding expression, the American and American races are said to be white and yellow. Lastly, Caucasian and White are the same, answering in a general way to Linné’s Europaeus albus. ‘European,’ however, can no longer be taken in this wide sense, since the division is now known to have also extended from Pre-Historic times to a large part of Asia, as well as to North Africa, where it most probably originated (Serge, Keane).

The terms African, Asiatic, and European have been proposed; but they have been introduced, so that nothing better has yet been suggested for Blumenbach’s somewhat equivocal Caucasian. As here used it does not mean a Caucasian, an inhabitant of the Caucasus (Georgians, Circassians) are or were assumed to be typical members. The three now nearly obsolete terms, Caucasian, Anthropoid, and Alfaro, are here discarded as useless, and leading to endless confusion.

As the four divisions have not remained stationary in their respective original homes, but have been diffused and mingled during Histrorical times, in the subjoined general Conspicuum are given their cradle-land, later expansion or retreat, and present domain, with approximate population.

19. Religions of primitive and later peoples; evolution of the religious sentiment.—In the treatment of religions, with which we are here more nearly concerned, it is assumed, with most unbiased observers (E. B. Tylor, E. Im Thurn, A. B. Ellis, F. S. Hatfield, E. Gsell, R. H. Codrington, T. Waiz, F. Ratzel, A. de Quatrefages, J. B. Ambrosetti, F. Bonn, P. Ehrenreich, J. W. Powell), that all later developments spring from the first vague notions formed by primitive man about his environment. The absolute starting-point, behind which it seems impossible to get, is everywhere the dream, which, as soon as the reasoning faculty is sufficiently awakened, enfolds the subtle and permanent relationship between human soul and body, spirit and matter. ‘The dreams which come in sleep to the Indian are to him . . . as real as any of the events of his waking life. To him dream-acts and waking-acts differ only in one respect—namely, that the former are done only by the spirit, the latter are done by the spirit in its body. Seeing other men asleep, and afterwards hearing from them the things which they suppose themselves to have done when asleep, the Indian has no difficulty in reconciling that which he hears with the fact that none belonged to himself. He excuses the fact that he did not see the spirit in his sight and motionless throughout the time of supposed action, because he never questions that the spirits, leaving the sleepers, played their part in dream-acts, and the sleepers themselves in their waking acts, at first sight strange fact that ‘a savage should be able to form for himself a conception of so immaterial a thing as a spirit.’ The quotations are from E. Im Thurn (Among the Indians of Guiana, Lond. 1853, p. 334). This is the earliest statement of the savage mind, and they have reference to the British Guiana natives (Caribs, Arawaks), whose religions system is perhaps the most primitive of which we have any clear record.

From this starting-point the development proceeds in two directions, which lead on the one hand to Psycholatry (Spirit-worship, Animism) in its simplest form, on the other to Ancestor- and Nature-worship, the two great factors in all primitive religions. For early man, after the conception of an independent soul is thoroughly realized in his own person, the next step is to extend the idea to his forefathers and to the plants, that is, to all living organisms, and, lastly, to the inorganic world, to such conscious and lifelike objects as the raging torrent, the rolling seas, snowy peaks, towering trees, steep rocky walls, glowing coals, electric arcs, laughing clouds, storms, lightning, torches, heavenly bodies, until all Nature becomes animated and everything personified and endowed with a living soul. But this soul emulates, so to say, from his own, and consequently resembles it in all respects, has the same passions, feelings, affections, and differs only in being, perhaps, a little more or a little less powerful; and this is essentially the universal principle of anthropomorphism (q.e.), which pervades all religions from the lowest to the highest. The mental qualities of the individual soul become the norm to which everything is referred, and, when in more advanced stages man likens himself to his deities, he is really fashioning his deities to his own likeness. Hence the intensely anthropomorphic character of the gods of the Babylonians (Ann, Ea, Mardik), the Semites (El, Baal, Jahweh), the Greeks (Zeus, Aphrodite, Apollo). So C. Hild Tent, speaking of the British Colonial Sociat tribe, tells us that ‘their anthropomorphic conceptions of the animal and vegetable world are of the same nature, thoughts. Even to-day . . . there is still a strong belief in the human or man-like side of animals, plants, and other objects and forces’ (JAI xxiv. [1904] 28). And so it is everywhere. Why any spirits, all being of a human nature, should be revered or worshipped at all is easily explained by the above remark that some may be more, some less, potent than man himself. The latter are, of course, treated with indifference, while the former are respected and even feared, and have often to be appeased, being for the most part ill-disposed towards mortals, whence the saying that time and he is a helpful friend, if even a human being was more powerful in life—a tribal chief, for instance, or any great warrior—he would also be more powerful in death, since death is only an extended sleep from which he may and does often return, as in explanation between human soul and body, spirit and matter. ‘The dreams which come in sleep to the Indian are to him . . . as real as any of the events of his waking life. To him dream-acts and waking-acts differ only in one respect—namely, that the former are done only by the spirit, the latter are done by the spirit in its body. Seeing other men asleep, and afterwards hearing from them the things which they suppose
pressed, of the Gold and Slave Coast Negroes; and the curious notions of the East African Wagiyrama people, who suppose that the departed spirits appear in their natural form and ask for food and drink. So, when it is a-brewing, some is poured out on the graves of the dead, who are asked to drink, and when drunk to fall asleep and cease to disturb the living with their brawls and bickering.

Thus also in Egypt, in whose sacred faith the god kal, or 'life,' and ra, or 'existence,' is endowed with various propensities; and thus, in the life, the dream, and believed in by the Egyptian scribe. In the after-life, as the Egyptians believed, the soul and the body are separate, so that man becomes disembodied and re-enter life, so that to live in a 'dead-land' they must die and be dismembered, and then rise again in the real human soul can do the same. Then, if evilly disposed, it will select the fiercest and most dreaded wild beast to effect its purpose—the wolf in Europe (whence 'wer-wolfs' and 'Werlachen' the devil in Germany); the tiger, leopard, hyena, shark in Africa; the jaguar in America; and so round the globe. Thus the principle extends even to the after-life; and Cummins (loc. cit.) tells us that the Nilotic Dinkas believe that the spirits of the dead sometimes take the forms of lions, leopards, hyenas, and such beasts. A transition is thus effected to the vampyre, a nocturnal demon, or the soul of a dead man who, the Slav think, leaves his buried corpse to suck the blood of the living (Tylor, *PC*, 1891, i. 192.)

From these animalistic notions, themselves the outcome of pure Animism (q.v., directly flow other religions, and the general attitude of spirit-worship. During the early phases of social life the safety of the tribe is supposed to be largely dependent on the dog-observing of the prescribed rites. Hence public worship becomes a matter of general concern. When a desire is entertained, as by the medicine-man, the witch, the shaman, the priest. These gradually assume of its nature as well as a sacred character; they are the means of the tribe, the people and their tutelary deities, and 'Church and State' are inseparably one. In the tribal council chamber—the Hellenic *prytaneum*, the Roman *capitol*, the American *kioet*, the Mungatta or *trinity-hall*—the super temporal and spiritual interests are transacted in common. Later, with the growth of general intercourse and increasing trade and wealth, a slow divergence takes place, and the agora and forum stand apart from, but still somewhat overshadowed by, the temple. Sacrifices and ceremonial rites of all kinds now acquire their full development, and are entirely controlled by the sacerdotal castes, which long continues to be an imperium in imperio, even exercising a direct influence on public opinion, as witness the death of Socrates. But, divorced from State affairs, religion becomes more introspective, concerned more with liturgies, outward forms, and dogmatic teachings than with personal conduct. In Arabia, the Babylonian Hades, the dead are judged by the goddess Beltis-Allat, and punished or rewarded, not according to the good or bad lives they may have lived, but according to the service they have neglected of the service of the temple, or taken part in sacrifices and offerings made at the shrines of the gods. Many religious systems certainly contain immoral elements, and place low ideals before their votaries. The faithful Musulim, for instance, is rewarded in the after-life with gross sensual pleasures, while in this life such a trivial thing as the use of knife and fork is regarded as sinful. But the general attitude of religion towards ethics is a wide question which cannot here be discussed. See the series of art. under ETHICS AND MORALITY.

Nor need we be detained with the higher forms of religion and their concomitants—polytheism and other forms of theism, Judaism, Brahmanism, Buddhism, Shintoism, Christianitv, metempsychosis (souls, immortality, nirvana, karma, as life, and the soul, all of which will be separately dealt with in detail.

10. CONJECTUS.

**ETHNIOIC, NEGRO, OR BLACK DIVISION.**

1. Western (African) Section.

Cradle-land: Africa south of the Sahara.

Later expansion: Madagascar, North Africa,
Southern United States, West Indies, Nicaragua, North-East Brazil, the Guianas.

Fan, (m. -mulun); Africa, 196,000,000; Madagascar, 3,000,000; America, 20,000,000.
total, 183,000,000.

Physical characters: head dolichocephalic, i.e. long from forehead to occiput cephalic index 72; taking length at 100; jaws prognathous; nose broad at base, short, flat; lips thick, everted, showing the red inner skin; cheekbones rather prominent; brow arched; eye large, round, black, with jaunty sclerotic; foot flat, with low instep and larskap heel; leg slender; calves undeveloped; arms disproportionally long; colour very dark brown and blackish, rarely quite black; hair short, black, woolly, flat in cross section, sparse or no beard; height above the average, 5 ft. 8 in. to 6 ft. and 6 ft. 4 in. (Turkana).

Mental characters: temperament and culture: sensual, unintellectual, fitful, passing readily from tragedy to comedy; mind arrested at puberty, hence unprogressive, this trait being attributed to the early closing of the cranial sutures or an earlier development of the cranial bones beyond the cranial sutures; no artificial arts beyond agriculture, stock-breeding, weaving, dyeing, pottery, woodwork, and metalurgy (iron, copper); in Benin artistic casting and carving in relief and on the round.

Spelling and pronunciation: with both prefixes and postfixes; stock languages numerous in Sudan, one only in Bantuland, besides Negrito, Hottentot, and Bushman tongues; in Madagascar; Malayo-Polynesian exclusively; in America, European patois exclusively.

Religion: generally at the stage of simple Animism, Ancestor-worship being on the whole more prevalent than Nature-worship; no one supreme god anywhere; chief deities Munktuntunka, with many variants, along the east coast, Nzambi, also with many variants, along the west coast, both intermingled in the interior; witchcraft and ordeals very prevalent; obeah and voodoo rites, with ceremonial cannibalism surviving in the West Indies, especially Haiti, and in the Guianas; human sacrifices and fetishism most marked among the Urani in Upper Guinea.

Chief Sub Groups: I. Sudanese (Negroes Proper): Wadof, Serer, Felup, Timmi, Kru, Nalu, Vei, West Sudan; Gurma, Mossi, Gurugu, with Bon, Bob, Tem, Top, Diola, Gold and Slave Coasts; Sonnay, Hauwa, Kaburi, Boghirmi, Mosgu, Yedina, Basa, Miki, Central Sudan; Igarro, Ibo, Nempt, Benin, Qua, Igbaro, Bogru, Lower Niger and Oil Rivers (Southern Nigeria); Mafo, Nube, Dinka, Golo, Shiluk, Buri, Fur, Nuer, Shuilu, Bongo, East Sudan and White Nile; Zendeh (Nama-Niam), Mangturtu, Monuf, A-Baromo, A-Bahu, Welle Basin.

II. Bantu (Neroioid Peoples South of Sudan): Waganda, Wanyoro, Lakes Victoria and Albert; Akkuyu, Akembo, Wapokono, Wanyu, Wamakari, Wagwara, British and German East Africa; Makua, Batonga, Banga, Basenga, Achavu, Mogwanga, Portuguese East Africa; Morotse, Malkauna (Mashona), Wayao, Zulu-Kafir, Basutos (Zulu and mixed): Africa; Ondjherero, Ovampo, Bundo, Eshi, Konga, Daceke, Mpongwe, Iwama, Duuta, Batanga, West Coast between Orange and Oil Rivers; Aduma, Bangala, Bala, Tusalbaqua, Buidalunga, Pungave, Mangemwe, Kanduna, Vuuranga, Vuvuoba, Balabhe, Boyans, Congo Free State.

III. Bafffand and Doubtfull Groups: Fula, West and Central Sudan; Fan, Ogowe and Gabun

Basis; Negrito (Akker, Wochua, Batuen, Obongo, Dume [1], Voto [1], Wandarorobo [2], Congo-Welle and Ogowe, Massa); South Africa; Hottentots (Namaqua, Griqua, Gonaqua, Koraqua, Hill Damara), Cape Colony, German South-West Africa; Vaalpens, Limpopo River.

2. Eastern (Oceanic) Section.

Cradle-land: Malaysia, Andamans, Philippines, New Guinea, Western Polynisia (Melanesia), Australia, and New Zealand.

Present domain: Malay Peninsula, Malaysia east of Flores, Andamans, New Guinea, Melanesia, parts of Philippines, and Australia.

Population: 2,000,000 (3), chiefly in New Guinea and Melanesia.

Physical characters: very variable, differing from the African section chiefly in the height, which is about or even below the average of 5 ft. 6 in.; the hair, though always black, is rather frizzly (' mop-headed') (Papuans) or shaggy (Australians); nose often large, straight, and even aquiline, with downward tip, and so-called 'Negrito nose'; few industrial arts; and magnesium; new and primitive, men and women, tend to be dark and thick, and sometimes more pronounced (Somans).

Mental characters: temperament and culture: Papuans boisterous, very cruel and treacherous, hunting and cannibalism common, generally more savage than the African; Australians better in all these respects, though at a much lower stage of culture (no tillage or navigation, and cruel puberty-rites); no science or letters anywhere; few industrial arts; elaborate wood-carving and good boat-building in Papuasia.

Speech: archaic forms of the Oceanic (Melayo-Polynesian) stock language everywhere in Melanesia: agglutinating tongues with postfixes in Australia and most of New Guinea; have no terms for the numerals beyond 2 or 3. In the Andamans the one stock language has developed agglutination to a surprising degree, numerous prefixes and postfixes being combined with the alliterative harmony of the Bantu tongues.

Religion: general, sometimes prevalent, with toto in Melanesia, and totemism in Australia; mana, a subtle essence or virtue like the Augustinian grace, is a distinctive feature of the Melanesian system, which is otherwise essentially animistic, distinguishing between pure spirits (supernatural beings that never were in a human body) and ghosts, i.e. men's disembodied spirits. There are prayer, sacrifice, divination, omen, death and burial rites, also a Hades (Loelombootogi), with trees and houses, and a ghostly ruler, but no Supreme Being. There is none of this in Australia and New Guinea, and in the Andamans they are little developed that many close observers have failed to detect it. The Australian Bunjji is too grossly anthropomorphic to be regarded as a spiritual being at all, much less a deity; and we are assured that those who credit these nations with a belief in gods have been imposed upon (Giles). But there are mythical heroes, such as Nurrungoni, who are already a kind of demi-gods, and may eventually tend to develop Ancestor-worship. Meanwhile, however, there is 'nothing of the nature of worship, prayer, or sacrifice'—a remark which may also be safely applied to the natives of New
Guinea, and to all the Oceanic Negritos. The Australian totemistic and panterny ceremonies must all be regarded as features of the social life, and in no sense religious institutions. 

Sub-Sections: Papuans, including the Papuans proper and the Melanesians. The Papuans, most typical of all the Oceanic negroes, occupy most of East Malaysia as far west as Flores inclusive, with nearly the whole of New Guinea. The term Melanesian gives (the 'Black Islanders') to the Melanesian world, most of which they occupy almost exclusively. The chief groups are New Britain, New Ireland, and the Duke of York, now by the Germans renamed the Bismarck, Archipelago; the Louisiades, Solomonas, New Hebrides, Banks, New Caledonia, and Loyalty, with the outlying western part of Fiji. The Australians, a highly specialized branch, with marked uniformity of type, speech, and usages, originally scattered thinly over the whole continent, now disappearing; Tasmanians of Tasmania, somewhat intermediate between the Australians and the Melanesians, all extinct since about 1876. Negritos, formerly wide-spread throughout Malaysia, now reduced to three detached groups; Andamanese of the Andaman Islands; Semangs and other tribes of the Malay Peninsula; and Aetas ('Blacks') of the Philippines, while they are extinct in several islands, but have left a distinct Negrito strain amongst all the other inhabitants (Malaysians, Japanese, Chinese, Spaniards).

MONGOLIC OR YELLOW DIVISION.

Cradle-land: probably the Tibetan plateau.

Early expansion: Indo-China, China, North and Central Asia, Mongolia, Macao.

Present domain: Japan, Formosa, China, Korea, Manchuria, Mongolia, Siberia, Turkestan, Tibet, parts of Irania, Armenia, and Caucasia; most of Asia Minor; parts of European Russia, Scandinavia, the Balkan Peninsula, and Hungary; most of Malaysia and Madagascar, here intermingled with the African aborigines.

Population: China, 380,000,000; Japan and Korea, 57,000,000; Mongolia and Manchuria, 15,000,000; Tibet, 6,000,000; Turkestan and Siberia, 8,000,000; Indo-China, 35,000,000; Malaysia, 8,000,000; and East Europe, 15,000,000; total, 546,000,000.

Physical characters: head brachycephalic, i.e., short between glabella and occiput; cephalic index somewhat variable, but mean about 85; race is always mongoloid; height and weight vary; eyes fairly rogenous; nose very short and flat, or snub; lips thin, never everted; cheek-bones very high and prominent laterally; brow low and moderately arched; eye small, black, oblique, outer angle slightly elevated, vertical fold of skin over inner canthus (a highly characteristic trait); foot normal, artificially deformed in Chinese women; colour—dirty, yellowish and light-brown (Malays); hair uniformly black, lank, coarse, lustreless, rather long, round in transverse section, no beard, but moustache common; height about or slightly under the average of 5 ft. 6 in., but tall in North China and Manchuria (5 ft. 8 in. to 5 ft. 10 in.).

Note.—Many grouped as Mongols originally, and among them, with them, speaking Mongol tongues, are now largely and even completely assimilated to the Caucasian physical type (Finns, Turks, Bulgarians, Magyars). They speak the Aigil, Stickans and Tsemans of the early writers.

Mental characters and culture: temperament generally somewhat reserved, sullen, apathetic, outwardly very courteous, but supercilious; very thifty, frugal, and industrious in China and Japan, elsewhere mostly indolent (Malays, Siamese); nearly all reckless gamblers; science slack; art and literature undeveloped; porcelain, bronze work, ivory carving, and decorative painting scarcely surpassed (China, Japan, Korea formerly), but all plastic and pictorial art defective, lacking perspective, and the human figure mostly caricatured.

Speech: three great linguistic families:

1. Ural-Altaiic (Mongol-Turkic), ranging with great lexical and structural diversity from Lapland to Japan, from the Lena Basin through Turkestan and Asia Minor to Turkey in Europe and Hungary. Japanese and Korean stand quite apart; but all the rest are typical members of the agglutinating order of speech, with unchangeable roots and variable postfixes, cemented together by the principle of vowel harmony.

2. Tibet-Indo-Chinese, from the Himalayas to the Pacific, and from the Great Wall to the Indian Ocean; originally agglutinating, now in every transition of phonetic decay towards monosyllabic, which is itself a little path, but a very late condition of articulate speech. In the process of decay innumerable homophones are developed, which have to be distinguished by their tones; hence the members of this family may be called monosyllabic-toned languages. Structurally they are isolating, the sentence being made up of unchangeable isolated words, the inter-relations of which are determined not by inflexion or affixes, but by their position, as often in English (James hit John; John hit James).

3. Malay-Polynesian, the 'Oceanic' family in a pre-eminent sense, ranging from Madagascar across the Indian and Pacific Oceans to Easter Island, and from Hawaii to New Zealand (Maori); all more or less agglutinating at various stages of dissolution, but untoned; vocalism predominates, and the vowels are more stable than the consonants—a trait peculiar to this group.

Religion: Psycholyt or in its widest sense is the dominant force in the worship extending both to the disembodied human soul (Ancestor-worship, which is now perhaps the most prevalent form) and to the innumerable spirits, bad and good (fong-shu and fung-shu), which people earth, air, water, and all natural objects of the Mongol world (pure Animism).

The practical Chinese and Annamese combine both cults, and, while passing their lives in terror of the malevolent circumambient genii, keep the anniversary of 'roast pig day,' as they call their 'All Souls' day,' by littering the graves of the departed with pork, chicken, cakes, and other food. This Spirit-worship still persists elsewhere, and lies at the base of the later pre-historic and historic superimposed cults. Amongst uncultured peoples (Siberians, Yakagbirs, Kalmuckaides) it takes the form of undesignated Shamans, where the worshipper (wizard, medicine-man, not yet priest) is the 'paid medium' of communication between his dupes and the surrounding good and evil spirits. Spreading from him this primitive shamanistic Bonbo (Boo-ah) still survives beneath the official Lamaism. Nor have the Tibetans yet forgotten their red and black demons, the snake-deities, and especially the primitive father of all the secondary members of this truly 'diabolical pantheon.' In North-East Siberia the tiger is ousted by the bear, and
here the Gilyaks, Oronoche, and Ainans are all bear-worshippers. The historical religions are largely a question of race, all true Mongols of Mongolia, Manchus, Chinese, Indo-Chinese, and all Mongolo-Tatars being at least nominally Buddhist; the Turks, Tatars, and most Malays Muham-

mudans; the Finns, Lapps, and Magyars now Christians. Other so-called State religions—

the Confucianism of China and Annam, the Shintoism and Bushidoism of Japan — are rather ethical codes, fostered and upheld for political purposes. The "filial piety," ethos, imbibed for, the most part means devotion to the reigning dynasty, while the great weight attached to the purely civic as distinguished from the theological virtues—

self-mastery, courage (the Roman virtus, 'valor'), benevolence, and loyalty—shows that the sole aim of these systems is to nurture good citizens in this world without a thought for the hereafter. Here is no antagonism between: ligion and ideology, but a complete divorce of one from the other.

Chief Subdivisions: Mongolo-Turks, commonly called Mongolo-Tatars. MONGOL BRANCH: Khel-

kus or Kharsns, i.e., Eastern Mongols; Kalmucks, i.e., Western Mongols; Siberian Mongols;

Tunguses, Manchus, Lamsuts, Oronoche, Golds, Gilyaks, East Siberia and Amur Basin. TURKI-

BRANCH: Yakuts of Lena Basin; Koryghs, Uz-

beks, Kara-Kalpaks, Turkomans, West Siberia and

Turkestan; Nogais, Tats, Anatolians, Turks, Os-

menli, Canasaia, East Russia, Asia Minor, Rumelia.

UGRO-FINNISH BRANCH: Soyaets, Ostiaks, Yogyuls,

Permians, Savyrians, Scoyoga, Lapps, Finns, Livonians, Verets, Mordvins, Cheremis, Bulgars,

(now Slavonized in speech), Magyars, Althi Mts.,

West Siberia, North and East Russia, Lapland,

Bulgaria, Hungary. TIBETO-CHINESE BRANCH:

Tibetans, Burmeets, Shan or Laos (Siamese Ahoms,

Khaotsi), China, Nogis, Mielabns, Annames, Chinese, Tibet, Himalayas, most of Indo-China and

China. MALAYAN BRANCH: Malayas proper, Stu-

dinese, Javanese, Madrasese, Balinese, Sasaks, Bugis, Monksassars, Dayaks, Tagals, Banyans,

Formosans, Huavs, and others Malagasy, Malay-

sia, Philippines, Fornnass, Madagascar. KOREO-

JAPANESE BRANCH: Koreans, Japanese, Liu-Kiu

Islanders, SUB-ARCTIC BRANCH: Chukchi, Kar-

yaks, Yukoghoirs, Kamchadales.

AMERICAN OR RED DIVISION: Cradle-land: the whole of the New World.

Present restricted domain: the unsettled parts and some reservations in the Dominion of Canada; Alaska; numerous reservations and a few tracts in the Western parts of the United States; most of Mexico, Central and South America, partly intermingled with the white and black intruders, partly still independent or in the tribal state.

Population: 51,000,000; 20,000,000; 15,000,000; 10,000,000; Mixtecos, Mixtecs, 20,000,000; total, 30,000,000; chiefly in Mexico, Guatemala, Colombia, Venenzuela, Peru, Bolivia, and Brazil; 5,000,000 only in the United States, and 100,000 in Canada.

Physical characters: large, heavy, very variable, long and very short in many places, intermingled inexc-
tricably: highest known brachycephaly in South America (the extinct Calchaquis with cranial capacity of 1,220 c.c.), very large and square; check-bones moderately prominent; nose large, bridged or aquiline; eye small, round, straight, black, rarely with Mongoloid Mongolism but variable and yellowish in color, South American woodlands; hair uniform, very long, coarse, dark, black (horse-
Chinook; Siouan (Dakota, Assiniboine, Omaha, Poneca, Kansa, Osage, Quapaw, Iowa, Oto, Missouri, Winnebago, Mandan, Hidates, Crow, Tutelo, Calawa); Shoshone (Bannock, Comanche, Utah, Heirs, blacks, Miwok, Shoshone, Creek, Alibam, Seminole, Apalache); Natches; Pawnee; Kewa; Salish or Flathead; Pueblo (Zuñi, Tewa, Taos, Picurí, Tusayan).

II. Caribuna-Pine (Tarahumarun, Yuma, Cora, Papago, Topehuanu); Sere; Guayareun; Taracan; Otomi; Mexican or Nahuan (Aztec, Chichimec, Pipil, Niguan); Mayu-Quiché (Toltecs); Huaxte, Maya, Lacandon, Quiche, Mamé, Cachiquel, Sutugil, Pocoman, Zenial, Cho, Zetil, Pocone); Zoque; Mixe; Mixtec; Zoapotl; Chortegan; Lencan (Chontal, Wolwa, Rama, Paya, Guatusa); Briib; Talamanac; Cuna.

III. Southern: Chibcha; Choco; Chinchesuyun; Quichua (Inca, Chancu); Aymara (Cola, Calchaquí); Antisuyu; Jivar; Zapore; Pano; Ticuna; Pura; Mojó; Barre; Curiutu; Caripuna; Charuc; Chuncho; Cocona; Conibo; Carib (Muisca); Akawi, Rucuyene, Bakari, Arecuna); Araek (Atorali, Wapiana, Maypure, Parezli); Warrak; Chiquito; Bororo; Botocudo; Rhipuna; Tupi-Guarani (Chiriguan, Caribuna, Paraguay, Tupinamba); Mayura; Tupi (Can, Tamoana, Tupinambaza); Payagu; Mataco; Toba; Guaycuru; Gaucho; Araucan; Puelche; Pampas; Tehuelche (Patagonian); Fuegan.

CAUCASIAN OR WHITE DIVISION.

Early expansions: 1. Malayan lands; Central West and North Europe; Britain; Asia Minor, Syria and Palestine, Arabia, Mesopotamia, Iran, Eurasian steppe between Carpathians and Pamir, India, South-East Asia, Malaysia, Polynesia, North-East Asia.

Present domain: nearly the whole of North Africa and Europe; Abyssinia and Arabia; parts of Turkestan, Caucasus, and Armenia; Iran, India, and parts of Indo-China; Malaysia and Polynesia; New Zealand; Australia; South Africa; North and South America.

Population: Europe, 355,000,000; Asia, 300,000,000 (Chiefly India and including unclassified low-caste Hindus); America, 115,000,000; Africa, 15,000,000; Australasia, 5,000,000.

Physical characteristics: Three types: 1. Homo Europaeus: head rather long; cephalic index 74 to 79; jaws orthognathous; cheek-bones generally small, not prominent; nose large and straight; eyes blue or grey, white sclerotic, straight; colour florid; hair rather long, straight or wavy, fair, flaxen, very light brown or reddish (‘carrot’), full beard; height above the average, 5 ft. 8 in. to 6 ft. 2 in. 2. Homo Alpinus: head short; cephalic index 80 to 90 and even 95; eyes brown, hazel, or black; colour pale-white, in aboriginal groups (East Africa and India) very dark, and even blackish; hair brown or chestnut and black, rather short and straight, or wavy, small beard; height medium, 5 ft. 5 in. 4 in. 3. Homo Mediterraneus: head long; cephalic index 72 to 78; nose large, straight, or aquiline; eyes black and straight; colour pale-olive or swarthy; hair black, wavy or curly; height moderate, generally between 5 ft. 6 in., except in aboriginal groups, which are often tall (Gallas, Sonals, Sikhs).

Mental characters and culture: temperament of I. slow and somewhat stolid, cool, collected, resolute, tenacious, enterprising; of II. and III. fiery, fickle, bright, impulsive, quick, but unsteady, with more love of show than sense of duty; all three highly imaginative and intellectual; but below the Hebrews, the Greeks, the Romans, and the Celts, who were more developed to some extent even from early historic times; most civilizations (Egyptian, Babylonian, Sasanian, Assyrian, Persian, Indian, Mayan-Quiché, Hellenic, or Italic) have had their roots in Caucasian soil.

Speech: mainly influence (highest order, with complete fusion of root and formative elements), but also agglutinating (Caucasian, Deccanic, Polynesian); several stock languages in Caucasus; one (Basque) in Western Pyrenees; apart from these the whole Caucasian domain is covered by four great linguistic families: 1. Haussa-Semitic, North Africa, South-West Asia; 2. Aryan (Indo-Germanic, Indo-European), most of Europe, Armenia and Irania, Northern India, most of America, Australia, Tasmania, New Zealand, parts of North and South Africa; chief branches: Indo, Iranian, Hellenic, Italian, Slavic, Lettish, Tendent, Celtic; 3. Dravidian, Southern India (the Deccan); chief branches: Telengia (Telugia), Toda, Ooty, Mundaru, Quichia, Tami; 4. Mouros, or into the Arorians, formerly perhaps wide-spread throughout India, now reduced to the Vindhyan uplands between Aryan and Dravidian North and South.

Religion: from the first Nature-worship seems to have greatly predominated over ancestor-worship. The Egyptians did not worship the embalmed dead, who were supposed to remain human in the after-life. The chief gods of the Semites were the sun and moon, and those of the Aryan—Dyaus, India, Zeus, Apollo, Jupiter, Saturn, etc.—were the personified elements of the upper regions. The eponymous heroes, such as Heracles, who may be supposed to have had a human origin, always remained mere demi-gods, and were scarcely worshipped at all. Amongst the Aryans the gods were symbolized in stone, wood, or bronze; and this led to the worship of the image itself—true idolatry, which, despite iconoclastic zeal, still persists amongst the mediocrate classes in many parts of Christendom. The picture of St. Anthony is not clearly distinguished from the saint himself; and, when it fails to protect the Italian bifoto from avarice, it is cursed and thrown into fire. So the general polytheism various shades of monotheism were slowly evolved by a natural process of elimination. The process is now going on amongst some of the lower races, and it is a popular error to credit the Semites with the monotheistic concept from the first, as if it were a sort of racial character, a special privilege of those worshippers of Elu, Baal, Molech, and innumerable other repulsive deities. Out of the monotheism thus evolved arose the historic religions of the West (Judaism, Christianity, Muhammadanism), while even polytheism still dominates the East (Dravahmanism in India, a degraded Buddhism in Ceylon). Between monotheism and polytheism is the dualistic doctrine which had its home in Persia, where Ormuz and Ahirman, the good and evil principles, contend for supremacy in the universe. This Zoroastrian system, which refers light and all good things to Ormuz, the host of angels, darkness and all evil to Ahirman and his host of demons, was already denounced by Isaiah, whose Jehovah is the single source of every-thing, ‘formans luem, et eremus teneturs,
facades paeianu, et creans malum '(43?'). Nevertheless, it is found its way into the early Christian religious communities, and explains the demonology, with all its attendant horrors, which flourished in medieval times, and is not yet quite extinct.

A. H. KEANE.

ETRUSCAN RELIGION.—I. ANCIENT SOURCES.—I. Etruscan documents. Unfortunately we have no original document giving such valuable information on the Etruscan religion as the calendar of festivals (Monm-ian, CIL, 2. 205 ff.) supplies for the study of the ancient Roman religion. It is true that the Agrum linen-roll (I. lodal) supplies an eligibility of a right to this point of the theory, do not seem to serve as monthly dates. It must be forgotten, however, that the Roman calendar of festivals itself, with its arrangement of kalends, none, and ides (Etr. ides), and perhaps also the actual institution of the liturgical calendar of festivals in Italy, is analogous to the calendars of the Etruscans. Archives of families, temples, and cities, the sifting of which has proved so important for the study of the primitive Roman religion, must be presumed to have had their counterparts also in Etruria, but none of these survive in the original; and, in particular, among all the 8000 extant Etruscan inscriptions we do not find, or at least have so far failed to identify with certainty, the most important and the most important of the inscriptions as statutes, minutes, formulas of prayer, or rubrics of the priests' colleges or the religious fellowships of individual gentes: the one or the two gratifying results which from this letter roll must be expected will be discussed below. Meanwhile we possess definite and reliable evidence of the fact that such documentary records, together with oral traditions, were at an early period brought into an orderly form—probably in rhetorical language—in works ascribed to mythical authors (Etr. the books of Tarchon and Tarchon, the mysterious titles ('libri fatales', 'libri Acharterici', § 35), and that afterwards, for antiquarian and practical purposes, they were reduced to a learned and complicated system in the 'libri fulgurales', 'libri hermaicai', 'libri rituales' (§§ 30-34), as the Etruscan disciplina.

2. Latin adaptations.—These books were often reissued in Latin forms, or adapted to Roman conditions, and the history and contents of this derivative literature must now be laboriously gathered from sporadic and casual references in the works of Cicero, Livy, Seneea, and Pliny the Elder, as also of grammarians, antiques, commentators on Vergil, gromatici, and Church Fathers. More or less prominent among those who dealt with the subject are the following: Tarquinius Priscus (before Vergil's time) made poetical experiments in the field of the Etruscan discipline for himself with the study of ostenta 'unnatural phenomena') as the objects of harmopica (§ 32). A. Cuccia, whose family came originally from the Etruscan city of Volteria, and was used to the Etruscan discipline, wrote, among other works, books de Estis, de Divinacian, de Animuibus, in which he can hardly have ignored the Etruscan discipline. The writings of Labeo, de Dis Animuis (§ 20), are mentioned in Servius's commentary on the Xemdl, while Julius Aquila, Umbriarius, Melior, Vicellius, and Caesius are cited by Pliny, Lydus, and Arrianus as authorities in the literature of the Etruscan discipline.

3. The Agrum linen-roll. The Agrum linen-roll—by far the longest Etruscan text (some 1500 words in twelve columns) that we possess—has been regarded as an original fragment of the Etruscan disciplina. The remains of this liber litus are found in Egypt, carelessly torn into strips and wrapped about a female mummy. They are now preserved in the National Museum at Agrum (Croatia). The writing and spelling of the fragment, and the dressing of the mummy, point to the Greco-Roman period. Arguing from the few words and the complete absence of the Etruscan alphabet, scholars are variously inclined to see in this formulary a sacrificial ritual (Krall, Lattes), a ritual calendar of festivals (Torp), portions of the Etruscan doctrine of the lightning-flash (Thulin) or a relic of Etruscan religious poetry bearing some analogy to the Engubine Tables (Thulin). To the present writer the various items of external and internal evidence (the circumstances of its discovery, the manuscript rolls of Etruscan sepulchral monuments, the divine names, litanies, and certain definite appellatives in the text itself) seem to indicate a funeral text, and also to imply a more than merely local and accidental connexion between the roll and the mummy—in so far, namely, as the funeral liturgies and the ideas of the hereafter found in the libri Acharterici (§§ 20, 35) may have in this particular instance been used in the same manner as the Egyptian Book of the Dead.

4. Other sepulchral rolls and longer sepulchral inscriptions. With the Agrum roll we may fitly associate the manuscript rolls and diptychs held in the hands of figures on the lids of Etruscan sarcophagi and ash-chests, or in the hands of the persons or the gods of the under world skirnished on the sides of these memorials, or painted on Etruscan vases; and, above all, the so-called paludes, a sepulchral inscription of nine lines upon an
open roll which the figure on the lid (i.e. the dead person himself) holds up before the onlooker. Nor is this the least of the information, the sepulchral tablet of Capna—so far as we are able to interpret it—an inconsistent with the conjectural contents of these funerary book-rolls; while the third longest Etruscan inscription, which of course, is certainly its Etruscan, but that it is hard to disentangle the Greek and Italic strands in the history of Roman religion, the difficulty will naturally be greatly intensified in the case of a religion like the Etruscan, where the literary sources in particular are much more scanty and the linguistic memorials remain in great measure unexplained, while the ethnological, linguistic, and religious relationships of the people have not yet been conclusively made out. The old and the new, the exotic and the indigenous, intermingling in the nebulous tradition; and, even where foreign influence can be clearly traced, it is often impossible to distinguish between ideas fused together by later syncretism and those mutually related from the first.

9. The impossibility of a systematic or genetic delineation.—From the sources (the bibliography of which will be prefixed to this article) we gain some impression of the various deities and systems of deities, the worship, and certain phases of the religions and ethical ideas of the Etruscans, and this impression, after the fashion of the preceding paragraphs set forth. In view of the defective and fortuitous transmission of the records, and owing to the impossibility of interpreting them clearly and finally, it is out of the question to think of reducing the aggregate mass of data to a system, or of tracing the course of their historical development. Moreover, we lack as yet—apart from a few excellent but still unfinished compilations of occasional groups of objects (see list under 7)—a critical or relatively exhaustive collection of the materials furnished by the various monumental sources. Such a collection, again, would be of little service without an atlas of illustrations—not only because religious ideas are reflected in the artistic portrayal of the various types of deities, and in the conceptions of the Etruscan sepulchral monuments and their abundant furnishings, but even more because, by reason of the peculiar character of the Etruscan record, the pictorial and glyptic sources usually speak to us more distinctly than the linguistic sources, which—still remain largely inarticulate, and with a considerable admixture of non-Etruscan elements. We should add further, that the (in part) very imperfectly preserved readings of the all-important Etruscan mirrors—especially of these published some decades ago—require to be collated once more with the originals; while a persevering philological investigation, not indeed, of the roots—for such were at present a hopeless task—but of the suffixes of the Etruscan divine names, would even to-day be a most serviceable piece of preparatory work (see § 14).

II. NAMES OF THE DEITIES. — 10. Ancient Etruscan deities.—The etymology of the genuinely Etruscan divine names remains for the most part an unsolved problem; nor do the vast majority of these names occur in the literary tradition. Still, the pictorial representations enable us to identify—what certainty, or, at least, with some degree of confidence—to a number of them with the names of Roman and Greek deities. That the spheres of connotation in such secondary identifications only partially coincide, though they seldom bear inscriptions, are valuable sources of information regarding the characteristics and the various types of the gods.

5. The difficulty of isolating the purely Etruscan element.—One very serious difficulty in regard to both the monumental and the literary sources is that of clearly disengaging the specifically Etruscan from the Greek or Oriental origin, and the Etruscan deities are, though they often seem to furnish certain analogies to them. In comparison with these as yet very imperfectly interpreted literary remains, however, the furnishings and contents of excavated tombs, such as mural paintings, reliefs, vases, mural vases, and sarcophagi, and also the abundant accessories of vessels, utensils, clothes, and ornaments warrant much more definite conclusions regarding the cult of the dead and the hopes and fears of the hereafter (§§ 25, 26) that prevailed among the Etruscans.
and Mercury, Jupiter, and Venus; and the sun and moon.

12. Deities mentioned in the literary tradition.

Other Etruscan deities, bearing Latin or Latinized names, are known to us only from the literary tradition. *Virtumnus* is designated 'deus Etruriae princeps' by Varro. (De Ling. Lat. v. 46). *Vortumna* comes before us as the goddess of the federal temple of the Etruscan cities, as Virgil says: *'A consulium ad movendam bella... in Etruria ad amanum. Vortumnæ agitata. Ibi prolatæ in annum res, decretque caunctum, ne quod ante concilium fieret."
The temple of Virtumnus, the goddess of destiny, at Volsinii was noted for the device of registering the years by nails driven into the door (Livy, vii. 3. 7). The Etruscan city of Mantua took its name from *Mantus* (cf. §§ 10, 25), the Etruscan god of the underworld, (ancient authorities in Müller-Deecke, Die Etrusker, i. 2, note 6). A mythical monster called *Volto* is mentioned by Pliny (HN ii. 53, 140). The nymph of Bregus and the divine youth Tages will be referred to (§ 25).

13. Oriental deities. While we are on comparatively safe ground in recognizing certain Greek and Roman deities under their Etruscan disguise, we are quite at a loss with regard to other foreign deities. It is true that the only Etruscan inscription (1) that comes from Carthage contains the name of the Semitic melek, but of the identifications of Etruscan and Egyptian deities which the present writer has ventured to suggest on numerous dressings brought from Egypt (§ 3), has ventured to suggest, not a single instance is absolutely certain. The question whether pre-Hellenic (Pelasgian, Etruscan, *Saturnia*, "Carian", "Cretan", "Hittite", or the like) type deities were Etruscan deities—a question which as regards some of these deities, e.g. *Hestia*, *Hades*, and *Selene*, a number of scholars answer affirmatively—is not, in the present writer’s opinion, yet ripe for decision. Babylonian and Etruscan affinities will be dealt with below (§§ 30-32).

14. Suffixes of divine names. Perhaps the suffixes of the Etruscan divine names may yet prove to be the key to further progress in this field, though some of these terminations are so slightly characteristic that they might even be Indo-Germanic. The others may possibly indicate only the Etruscan modifications of Italic, Greek, or Oriental names. The forms noted below may serve at least as a starting-point for further discussion; meanwhile it is important to notice that in some cases the same suffix may occur in the names of both male and female deities.

**III. SYSTEMS OF DEITIES.**—15. Triad, ennead, deoducid; *Dei involuti.* The various deities of the Etruscans (see Hesych. s.v. *aïou); Sueton, Aug. 97; Dio Cass. liv. 29) were grouped in distinct orders or systems. In every city that was founded *Etrusco ritu* special honours were accorded to the divine triad of Tinia, Uni, and Menrva, and a city which had not dedicated these three temples to the triad could not hold a consilium. In an ennead of gods, again, there belonged the power of lighting certain kinds of lightning (manubiae, *hand-weapons*, separate flashes); and, as Tinia grasped three such *manubia* in his hand, there were in all eleven distinct species of lightning (Plin. HN ii. 138) in this connexion the number eleven is probably derived from Bab. ideas (Serv. on Geor. i. 28). The *prima manubia* was held by Tinia en *consilii*; the *seconda* was sent with the advice of the *docend* of gods (*hos Consentes et Complices Etrusci aiunt*, quod una orientur et occident unam, *i.e.* the two directions of the world, Liv. ii. 25, 11). *Sancio* and *Vortumnus* are mentioned as deities of *misery and misdirection*; *sed eos summum Jovis consiliiarios ac participes existimabat* (Varro, in Arnob. ii. 40); the connexion of these six pairs of deities, who daily rise and set together in the sun, with the *Gr. Ekecheirêth, the Graeco-Oriental Et Eiletheria, the twelve months, and the Babylonian signs of the zodiac, is quite unmistakable). The *tertia manubia* however—the most destructive of all—was sent by Tinia only with theconnexion of the *dei superiores, involuti, or oportuini, whose names and number were unknown, and who, mysterious and inextricable, sat enthroned above all (Caelina, in Seneca, Nat. Quest. ii. 41; Varro, in Arnob. ii. 40).

16. Deities of lower rank. From these exalted gods we must distinguish the groups of spirits associated with persons and places. Here, however, it is more than usually difficult to detach the Etruscan from the Roman element. The *lores* (O. Lat. *lares*), the spirits who attach themselves to particular plots of land, and roam about at the same time (ii. 2, 6), are usually men who dwell hold way in the *penus*, i.e. the storeroom, beside the kitchen and the hearth; the *genni* of men and the *jumones* of women, who, as guardian spirits (Salienses), are accorded special honours on birthdays, just as the tutelary saint is honoured on the name-day, which
by its association with baptism became the true birthday of the Christian; the \*ainma hindu, or divina anima, the deified soul of the dead; the \*dei genii, this or that particular god; the gens; all these Roman divinities reappear—some quite evanescently, others more palpably, in the Etruscan tradition as well, though we cannot form a clear impression of the several groups, of their derivations from different sources or from other types (gods of the under world, ancestral spirits), or of the way in which they were fused together at a later stage.

17. Lacies.—But we are able at all events to distinguish the prenomen

Etr. \*Lar
Lat. \*Lar
Gr. \*Areus

with the long \*d attested by the spelling and accentuation of names like Lārinus, Laar, Lāronis, Areus, from the Lat. appellative lār (from \*lāre), gen. lāris, O. Lat. pl. lāres, with \*d short by nature. Lat. on the other hand, is not impossible that the Lāris, the gods of the other world (Ov. Fasti, ii. 599 sq.), whom scholars are unwilling to detach from the Lāres or Lases, may be akin, alike in name and in function, to the Lāsa (quantity of first a unknown), seen as a winged and attired god—possibly, under Latin, and standard between the seer hompere (Ἀμφατώς) and the vates (Afar), whose look is submissively bent to the ground (Gerhard, Etr. Spiegelt, iv. fig. 350). But there is a still unexplained incongruity between this particular Lāsa and the usual Lāsa-types of Etruscan mirrors (§ 23); and the \*Lāra 'used by Ovid instead of the ordinary \*Larunda' may perhaps be peculiar to that writer. The identication of the Etruscan deities lēxia and lāsa found on the Piacenza linter with the Lar militaris and the Lar coelestis mentioned by Martianus Capella is quite uncertain.

18. Penates.—Our authorities with regard to the Etruscan penates are Nigidius and Cessius, as quoted by Arnobius (adv. Gent. iii. 40). Both writers speak of a tetrad of deities. Nigidius distinguishes four genera, viz. the di penates Jovis, Neptunei, Inferorum, and mortali hominum; while Cessius specifies the four individual deities, Fortuna, Ceres, Genius jovialis, and Paies. In the four categories of Nigidius may be discerned the four elements—sky, sea, under world, earth; but whether, or in what manner, the four deities of Cessius are to be brought into relation with these, the present writer does not venture to decide.

19. Genii and junones.—Whether the term genius ('procreator') is the Lat. rendering of an Etr. word, as has been conjectured, and whether the Roman genii and junones had their counterparts in Etruria, it is likewise impossible to say. A genuine Jovisalia as one of the Etruscan penates was cited above (§ 18); in Festus, 359, Tages (§ 29) is designated genii illuxis, nepos Jovis. The serpent, the Roman symbol of the genus, is not infrequently depicted on Etruscan monuments.

20. 'Dei animales.'—The practice of defying the dead has left its impression in the sepulchral art of the Etruscans, and is directly attested by the literary tradition. According to Servius (on Aen. iii. 165), Laboe, in 'libris qui appellantur deis animallibus,' had written: 'esse quaedam sacra quibus animas humanae vertantur in deos, qui appellantur animales, quod de anima fant'; and Arnobius (adv. Gent. ii. 62) explicitly says: 'Etruria libris in Achenoricis pollicitur, certorum animallium sanguine numinibus certis dato, divinam animas fieri et ab legibus mortalitatis educt.' Such a deification is mentioned of the Lat. names by one of the Etr. names is indicated by the phrase \*ainma hindu (the deified soul of the dead)—is repeatedly referred to also in the text of the Agram roll.

21. 'Dei gentiles.'—We may safely assume, therefore, that ancestor-worship and the cult of the dead prevailed among the Etruscans. But to determine whether and in what manner this cult was transferred from the Etruscan to the Romans, which was not very fully developed, and which borrowed most of its materials in a rather superficial way from Gr. mythology (§ 11), was connected with the cult of the dead is certainly very difficult. We are able to distinguish more and more clearly a series of clan deities, though the relation between the deity and the gens—even in a chronological respect—is not always evident. In these cases the name of the gens is added in adjectival form to that of a well-known deity, or else the clan name and the divine name are simply identical. Thus in funerary text-rolls we can clearly trace the cultus lepini, i.e. a death-goddess of the gens \*lepini; and the uni versusnet, the junco of the gens Oreminii. The Etr. divine name sateris is related to the Etr. clan name saternas as the Lat.-Etr. clan name satrius to the Rom.-Etr. name Sacer. The Etr. divine name numisius, which the Rom. explain as the Numitoris was sometimes called Numitorinus and sometimes Mars; the gens Numisia worshipped Numisius Martius or Numisius Mars; and, similarly, we find in Etruscan inscriptions a maris hus- na-no, and assimilated to the Lat. gens Hune, and deities, that is to say, of a gens Fuxia (\*Huvia)—these names being fitted with characteristic Etruscan suffixes and accumulations of suffixes. Nor can it be disputed that the Etruscan or semi-Etruscan goddesses Anchoria of Fesule and Asculum, and Feronia of the Faliscan Soracte, are connected with the Anchori and the Heruli (=Ferruli; in the Latin dialectic gen. eruli), and that the name of the dictator Egerius Lovius explains that of the \*nympha Egeria; and, similarly, the name of the Etruscan \*nympha Bego, Vegoua, \*Vegonia (inferred from the adj. Vegenous) is quite identical with the regular feminine form of the clan name veci, i.e. with veci, *veciae, *vecinia; and, if we are unable to say with certainty whether the lāsa veci belongs to the same group, it is only because the spelling with -u instead of -ui (which would in this case make lāsa veci = lāsa veci = Lāsa Bego) has been but rarely found, and because the explanation breaks down when applied to other names with lāsa (§ 23). The Roman and Etruscan deities Vitanus, Vortumnus, and Volumnus, Volturnus (§ 12), as appears from the stems and the common suffix of their names, are connected with Etruscan gentilicia; while the names of the death-goddesses Tanaea, Manto-er-ana, (§ 25), and Laver-na, to judge from their structure and their stems, may really be pure Etruscan forms of clan names. 22. 'Ani' and 'uni'—clan deities?—Even the names of the well-known Etruscan deities ani (m. and uni (f) cannot be satisfactorily explained on any other hypothesis. The word Janus — the original Etruscan name was noted above (§ 11)—is in Latin an o or a stem family in the Etr. name, instead of being, as we should have expected, *œn or *anu, is ani, which would yield in Latin an otherwise unknown *Janunus, or would exactly correspond to an Amnisus (cf. *Amnis, the Etruscan king [Alex. Polyb. in Plut. Parali, min. 40]), and this would imply that an Etruscan clan (=gens) god had at a later stage come to be identified with the Lat.-Faliscan Janus, owing to the similarity of their names. The name Junius —the Etr. equivalent of the Faliscan prenomon inuno, the Faliscan patronymic iuno, the Roman gens Junia, and the month Junius (not *Jumonius) are all undoubtedly connected with the same root, a connexion which cannot be made out philologically; the name Juno, *iuno, not yet satisfactorily explained as to the final constituent of its stem, would
yield, in Etruscan, the form *unuui or *unuuiia; while the Etr. uni is the representative of an extinct Latin, or perhaps (in view of the Faliscan cult of Juno in Samnium) of a Semitic name-form *Jania, unless, indeed, it really represents the Indo-Germanic feminine form in -ne of which only fugitive traces survive in Latin itself (Skr. yuni cf. Etr. *yuni).

23. Etruscan *yuxa.*—We find numerous representations of the goddesses whose function it is to serve and adorn others. The majority of these belong to the group of *turas,* and may be most appropriately compared with the Horga and the *Charites.* They are depicted as winged, and generally as naked, but they wear trinkets and ornamental shoes, and handle vessels for anointing, hair-pins, and mirrors, or crown others with wreaths, fillets, or sprays. Two of them—*banx and esaukva—are seen assisting at the birth of Athena from the head of Zeus, just as the Greek Horkai likewise sometimes act as midwives. They are designated either by the Latin name (now an appellative name), or by this name joined to a personal name, or, again, by a personal name alone. Of such names, most of which remain unexplained, we may mention the following: *lasa rosea* (? *rosea?* (§ 21), *lasa sitica, lasa bonora (= *bonora?), lasa racuneta, alpan, axvirv, evan, iziapa, izipana, iziapa, izima, baiha, burun, mean (*meun), mabzux, mabzux, puriv, resvul, senapa, taivsa; while *nabixiv and *Anzvul (Psyché) also seem to belong to the group.

24. Date-remembering goddesses.—Whether the term *lasa* was broad enough to be applied in some cases (§ 17) to the goddesses who record or predict fate—such as *vani or melazuta—must remain an open question. It is quite possible that at a later stage the recording *Maja* and, above all, *Atropos,* took the place not only of the Roman *Paros,* but also of the Etruscan death-spirits, and, in particular, of *vanx.* Whether in any given case the goddesses who appear on Etruscan monuments holding a stylus and a roll or dipyx represent the ancient Etruscan *vuast or the Etruscanized Atropos (atrops), melazuta, or a lasa, cannot always be decided.

25. Hell.—The goddess *vanx* just referred to, together with her companions *calis* (§ 21) and *leuiz,* introduces us to the Etruscan views of Hell; the horrors of which might seem to be collected in the demons of Michelangelo and in Dante’s *Inferno.* Grausome figures (*xarun, txulgka), with distorted faces and animals’ ears, and with hammers held as if ready to strike down the circle of those who have loved their own. The sad necessity of parting is most touchingly portrayed on ash-chests and sarcophagi; on foot, on horseback, by waggon, or by ship, the dead set out on their long journey to the under world. In paintings on the walls of chambered tombs we see *aita (‘Alba) and gezipezi (Herapefôrbi) sitting enthroned, and in a bronze-mirror, *tarsa aita (‘Hades-Hermes’). It is only in the later art that *Maiesta, a speaker of *as, is spoken of as the Etruscan god of the under world, but he seems to be identical with the *muntrax of the monuments; while our sole evidence for the Etruscan origin of the death-goddess *Maiesta* (alongside of *munt-rax, Lar-e-ro, and Turpea) is the linguistic structure of their names (§ 21).

26. Paradise.—The ideas of the Etruscans regarding the hereafter, however, had also their peculiar, naive character. We must refer the reader to the practice of defying the souls of the dead—perhaps an Orphic-Pythagorean acerrion—which finds expression in the literary sources. It is true that, on the whole, the Etruscans did not have been in very susceptible to mystical views of the life beyond. The gorgeous displays seen in the cemeteries of Southern Etruria present, not the glorified
ETRUSCAN RELIGION

28. Religious ceremonies.—The cultus consisted in prayers and imprecations, sacrifices and sacrificial meals. The worship of statues and theapedistu was a prominent feature in Etruria; while games, dances, music, statelily processions, horse-races, and prize-fights (often attended with bloodshed) all had a place in the service of the gods.

We cannot fail to recognize the presence of formal litanies in the Agrim roll—especially at the top of column 7; and Varro (De Re Rust. i. 2. 27) transmits in Latin form an Etruscan rhythmical charm for diseased feet which he had taken from the book of the Etruscan Sacerne. Mention was made above of imprecatory tablets and the Magliano lead (§ 35). The epigraphic ABC monuments seem to have been used for the same mystical and apotropaic purposes as their Greek and Roman counterparts.

Besides the ordinary votive gifts, which often take the form of bronze statues of the deities to be worshipped, we find in Etruria, as elsewhere in ancient Italian soil, other offerings of a peculiar character, such as clay models of heads, faces and parts of faces, arms and hands, legs and feet, engraved to illustrate the special emblems of generations or deities, which may have served as expressions of the worshipper’s gratitude for restoration to health or the blessing of children, or of his desire for such benefits.

Animal sacrifices were of two kinds, hostiae animales, and hostiae consultatoriae (Serv. on Aen. iv. 56). In the former the soul or life of the animal was sacrificed to the gods as a propitiation and a substitute for the soul and life of man; in the latter the offering solicited a revelation of the deity’s will or counsel in the entrails of the victim. But alike in the monumental and in the literary records we find evidence also of such barbarities as the massacre of prisoners and stoning to death.

29. Origin of the disciplina (Tages, Beego), and its divisions.—The Etrusca disciplina was traced to a mythical origin. The wondrous child Tages was cast out of a clod by the plough, and those who crowded round to hear wrote down what he revealed and sang (Cic. de Divin. ii. 50, and other writers). The ‘nymph’ Beego (§ 21) taught Arruns Volturnus (Etr. arni ultane) the sacred law of limitation (§ 33). The doctrine thus revealed falls into three parts—the libri fulguratores, libri haruspici, and libri rituales. The libri fatales and libri Acheronici, to judge from their contents, seem to belong to the second category of increased religious importance.

30. The libri fulgurales.—The libri fulgurales contained the Etruscan doctrine regarding the regions of the heavens and the gods of the lightning (§ 15). The fulguratores (§ 27) defined the various species of lightning according to their origin, force, and result; they interpreted the flashes according to the objects struck—places, trees, buildings, sanctuaries, statues, or human beings. They propitiated the lightning by removing the traces of its work (‘burying the lightning’); they knew how to mitigate or suspend its effects, but they had it also in their power to call it down by adumbrations and to summon the deity to appear in the flash as guest or counsellor, or to destroy an enemy. With such adjurations the rain-charm would doubtless often be combined.

That the object struck by lightning becomes taboo, sacred, or religiosum—a thing in face of which man vacillates between dread and worship—seems to be a universal human belief; but whether the divination of the Etruscan doctrine of the lightning by priestly speculations shows its details the influence of Roman, Greek, or Babylonian ideas, or whether—as was the case with haruspicy—it was the means of conveying Babylonian ideas to the Romans, and perhaps to the Greeks as well, is a problem that awaits further investigation.

31. The ‘libri haruspici.’—The libri haruspici comprised the treatise on the revealed allegories of entrails, and especially of the liver. The rocking entrails of the slaughtered animal were believed to be the media through which the gods spoke to men.

The bronze list of Piacenza (§ 58) contains the gods and divine names, that shows the Etruscans, like the Babylonians, assigned to their deities definite localities both upon the liver and in the sky, and that their doctrine of the lightning was inherently related to the stars. Thus Martianus Capella (de Nuptiis Mer. et Philol. i. 41-61) and the Piacenza model both represent the celestial temple of the Etruscans, but each in its own way, so that the regions and deities of the one cannot be summarily identified with those of the other.

In Etruscan, as in Babylonian haruspicy, the opus locinorium, the pars familiaris, and pars hostialis (right and left), the fossa (indentations and crevices often seen especially in the sheep’s liver), the fero (tips or edges of the liver), and the gall-bladder all had their special functions. We cannot say as yet whether the clay models of livers with Hittite connotations of general divination, which may have served as expressions of the worshipper’s gratitude for restoration to health or the blessing of children, or of his desire for such benefits, were ever used in the Etruscan model, or at all, or whether they have been connected with the celestial temple of the Etruscans. But we can even now make out a certain textual connexion between the Babylonian examples and the liver of Piacenza. Thus the two leading types of Babylonian haruspication were as follows: (1) ‘If the left side of the gall-bladder is thus or thus, the enemy will capture the sovereign’s country’; or (2) ‘If the left side of the gall-bladder is complete, the flattened middle of the gall-duet is the hand of Ishtar of Babylon’; and, when we compare with these the divine names in the several regions of the Etruscan model, we find that they are abbreviations of the second type. Both the Etruscan and the Greek practice of haruspicy seem to be directly related to the Babylonian; the Roman estrapiciem was no doubt strongly influenced by the Etruscan system, but its sole object was to decide whether the victim was acceptable to the deity or not, whereas the Etruscans read in the liver revelations of the future, even in minute details.

32. The ‘libri rituales (‘oscenta’).—The Etruscan doctrine of the lightning-flash and of haruspicy were in certain portions closely akin to the doctrine of ostenta, which formed a division of the libri rituales. One class of these ceremonies, that which the doctrine of ostenta is found in the responsa given by the Etruscan haruspices to the Romans who consulted them. With reference to any particular praedia, the following four points had to be determined: (1) From which deities did the sign proceed? (2) Why had they sent it? (3) What did it portend? and (4) How was it to be propitiated? Examples of such ostenta were earthquakes, tempests, showers of stones or blood (fire-balls) in the sky, and comets. Illomened trees with black fruits, and unlucky animals (beasts of prey and night-birds) struck terror into the beholder; white horses and rams with pure and bright spots or pellucid spots of luck; serpents might portend either good or evil. Monstrous births, especially hybrids, and grotesque animals stirred the imagination, and such creatures—chimeras, winged beasts, and crosses between lions and birds—appear also on the monuments, but have not as yet received special attention. These terrifying signs were usually propitiated by removing all traces of them. Statues which had been thrown down by tempest or lightning were set up more securely; injured temples were consecrated anew. Monsters and hybrid children were thrown into the sea or buried alive; adults who changed
their sex were banished to a desert island. A marriage disturbed by an earthquake or a celestial portent was postponed. Animals that spoke were supposed to be the mouthpieces of deities, and were made objects of sacrifice and of divination by observing the flight of birds was indigeneous to Etruria. Babylonian ideas make their influence strangely felt likewise throughout the Etruscan doctrine of ostenta, even in points of detail.

33. The 'libri riteules' (limitation, and ceremonies of consecration and foundation). — The libri riteules contained also directions regarding ceremonies on particular occasions. Plots of land, houses, temples, and cities had to be orientated and limited Etrusco ritu: pomerium and mundus seem originally to have been Etruscan terms. The arts of land-surveying and architecture enjoyed the sanction of religion. The books of the chronacitor contained an oracle of Vegois (§ 21, 29) regarding the surveying and allotment of land (agrimensoria, 330); the word gruma itself is most satisfactorily explained from Latin analogon agrimensorum —as a derivative of the Gr. ἀγρόμεσσα (acc. ἀγρόμεσσα). The Etruscan temple-design and the Etruscan ritus for the foundation of cities were adopted by the Romans. The excavation made, e.g., at Marzabotto confirms the literary tradition. The investigation of Italian place-names has yielded a surprisingly large number of Etruscan forms; and, as such names are nearly always attached to high places capable of being defended, they are in all likelihood to be explained on the theory that urban colonies of Etruscans, located above and amidst the Italic peasant farm-houses, were founded and named Etrusco ritu by the ruling families of Etruscan nationality; though it is not, of course, to be supposed that these settlers, who, being relatively few in numbers, would soon be granted the rights of conubium and commercium with the neighbouring peoples, were able to maintain the distinctively Etruscan character of their new localities.

34. The 'libri riteules'; law. — In Etruria, legal institutions likewise formed a branch of religion. The earliest code and general code: the juris civilis was merged in the jus suumrius of the religious books. The law of property seems to have been connected in the closest way with the sacred art of land-surveying. The saying of Vegois, found, as noted above, in the writings of the agrimensoria, finishes with words that suggest the phraseology of Oriental religions: `propeterea neque fallax neque bilunguis sis; disciplinam pone in corde tua.' The perjuror and his offering were doomed to become ingrates and outcasts. The frightful penalties wreaked upon hermaphrodites in Etruria (§ 32) are found attached to certain crimes also in Roman Law. By a fortunate accident of transmission, a representation of the solemn Etruscan rite of adoption has come down to us: a sketch on a mirror shows us the adult Herakles sucking the breast of Juno in the presence of the other Olympiads. The child and the adult respectively do the rite of adoption, the child being admitted into Olympus in virtue of the milk-tie—a relationship which is quite common in the Canaanites, and which, through the influence of Judaism, has become a universal law in the East. Cf. art. 36.

35. The 'libri fatales' and 'libri Acherontici.' — The libri fatales and libri Acherontici—the books of fate and of death—were also included among the libri riteules. We have already spoken of the definition of souls (§ 20); and in accordance there-where with the Acherontic books would appear to have contained certain elements of the Orphic-Pythagorean doctrine of metempsychosis, and, in the manner of the Orphics, they based the fact upon certain mysterious sacrifices. The books treated also of a certain respite of fate: a secondum aruspicis libri et sacra Acheruntia, quae Tages compensiase dictur, fata decem annis quadam ratione differi ... primo loco a Jove dicebatur (Serv. in Curi, viii. 393). Birthdays and other periods of life were accounted of great, and even critical, importance. The libri fatales assigned to human life a duration of twelve heldorns; but, when life had selected to ten heldorns, or seventy years, man could no longer delay the incidence of fate by propitiatory rites. From that stage onwards he must ask nothing more from the gods; and, even if he should survive for other two heldorns, yet his soul is really suffered from his body, and the gods vouchsafe him no further prodigia (Varr., in Censorinus, xiv. 6).

36. 'Secula'; cosmogony. — The doctrine of the periods of human life was adapted also to the life of the Etruscan city-State, appearing here as the doctrine of secula, which we meet with again in the sphere of Roman history. It was believed that man is released from the respite of fate by attaining the age of secundum a quo the Etruscan chronology was laid down as 307 b.C.—a date which is perhaps more without importance than regard to the appearance of the Etruscans in Italy.

The Etruscan cosmogony was of a very remarkable character. According to the account of it given by Suida (s.v. Topopoll.), the demigod appointed twelve millenniums for his acts of creation, and assigned them severally to the twelve signs of the zodiac. In the first chilid he created heaven and earth; in the second, the firmament; in the third, the sea, and the waters upon the land; in the fourth, the great lights of heaven—sun, moon, and stars; in the fifth, everything in air, earth, and water that creeps and flies and runs upon four feet; and in the sixth, man. Six thousand years had thus elapsed before the creation of man, and the human race should endure for six thousand years more. The similarity of this creation story to the Biblical account is unanswerable. Whether the source now by Suida, and very vaguely indicated by him, had been composed under the influence of the Biblical narrative, or whether his account really embodies an ancient Etruscan tradition—in the sense, let us say, that Western Asiatic conceptions underlie both the Biblical and the Etruscan doctrine of the origin and the secula of the world—is a problem which we are at present unable to solve.
Jahresber. über d. Fortschritte d. klass. Altertumswissensch., exl. (Leipzig) 1909) 76f. ('Religion,' nos. 48-51; previous years, 1907-1908, 1906-1907. A short summary of the literature will be found also in many treatises on Roman religion.

EUCHARIST (to end of Middle Ages).

The title "Eucharist," as applied to the central rite of the Christian Church, has its origin in the thanksgiving pronounced over the bread and cup by Christ at the Last Supper (Mk 14:22-25, Mt 26:26-29, Lk 22:19-20). This was followed by the Christian "thank-offering," with special reference to the bread and wine over which the thanksgiving was pronounced (Didache, 9; Ignatius, Philad. 4, Smyrn. 6; Justin, Apol. i. 69). On the use of the words ἐυχαριστία, ἔχος ὑλὴν, see note by Hort in TTHS iii. 594 ff.; and on the later history of the parallel word εὐχότια, based on the "blessing" (ἐὐχότια, Mk 14:26 [Mt 26:29]) pronounced at the institution, see Brightman, Liturgies Eastern and Western, Oxford, 1896, Index. There is no instance of these uses of the word εὐχάριστος in the NT, where the term employed to denote the common meal of the Christians with which the Words of Institution were associated, was the blessing of bread (τὸ κλασμα τοῦ ἱεροῦ, κλασμα ἱεροῦ, Ac 27:38, 28:11, 1 Co 10:16); in the last the "cups of blessing" is also referred to and "supper of the Lord" (ἐυχαρίστητα Λουδου, 1 Co 11:25; see below). From the presentation in the rite of bread and wine regarded as an offering of the fruits of the earth, along with the prayers and thanksgivings of the worshippers, the term "sacrifice" (θυσία, Did. 14) or "offering" (Iren. adl. Hier. iv. xviii. 1, eccl. hist. obit.; cf. Clement of Rome, ad Cor. 40, 44) came to be applied to the rite. Later expansions of this earlier language will be illustrated in the course of the present article. See, further, Drews, PRET, art. "Eucharistic.

1. Accounts of the Last Supper.—The four passages dealing with the Last Supper are Mt 26:17-29, Mk 14:22-25, Lk 22:19-20, 1 Co 11:23-26. Of these four accounts Mt. is dependent on Mk.; St. Paul supplies fresh features, while Lk. exhibits important differences from the other three. According to the Synoptists and St. Paul, Jesus on the evening before his arrest, during a meal with His disciples, took bread and pronounced over it a blessing or thanksgiving (ἐυχάριστα, Mt. ἐυχαριστήτα, Lk. έχος ὑλὴν). Paul usés the phrase in his Epistles, with similar meanings (1 Co 11:25; the "blessing" or "thanksgiving" is an act of praise addressed to God). The bread was distributed to the disciples with the words "This is my body;" and 

Paul has the same words, with the addition "as often as ye drink it," after the words about the cup (the word under discussion in connection with the cup is not found in the textus receptus of Lk.). Paul and the textus receptus of Lk. assert that it was "after they had supped" that the thanksgiving and the cup were given; Mt. and Mk. the account concludes with the words, "Verily I say unto you, I will no longer drink of the fruit of the vine, until that day when I drink it new (Mt. adds 'with you') in the Kingdom of God." These words are absent from Lk. in this connexion, but similar words appear earlier in his account, in connexion with the thanksgiving over a cup and the delivery of it, before the blessing of the bread. Hence Lk.'s account concludes with the words, "for as often as ye eat this bread, and drink the cup, ye proclaim the Lord's death until he come" (in which Schweitzer sees a reminiscence of the concluding words in Mk. 14:25).

The main problem in the NT account of the institution centres in Lk. Westcott and Hort, on the ground of the omission of vv. 31-26 in some very early Western authorities, regard this whole section as a later insertion (see Sunday, in HDB ii. 630). But the resultant text is full of difficulty. According to their reading, in v. 21 Jesus alludes to the fact of the bread and wine before He suffers, and declares that He will not eat of it, until He builds His church on earth. The expression, however, is parallel to the textus receptus, and the Greek of the textus receptus is supported by the readings of the second group. (See above, p. 630 on the early manuscripts of the textus receptus of Lk.) The textus receptus of Lk. asserts that it was "after they had supped" that the thanksgiving and the cup were given; Mt. and Mk. the account concludes with the words, "Verily I say unto you, I will no longer drink of the fruit of the vine, until that day when I drink it new (Mt. adds 'with you') in the Kingdom of God." These words are absent from Lk. in this connexion, but similar words appear earlier in his account, in connexion with the thanksgiving over a cup and the delivery of it, before the blessing of the bread. Hence Lk.'s account concludes with the words, "for as often as ye eat this bread, and drink the cup, ye proclaim the Lord's death until he come" (in which Schweitzer sees a reminiscence of the concluding words in Mk. 14:25).

Those who adopt the reading of Westcott and Hort regard v. 31 as taking the place of the narrative in Mt. and Lk. about the cup, which thus precedes the blessing pronounced over the bread (for this connection see the note on the words referring to the cup). This parallelism exhibited in vv. 13-18 suggests that these verses are closely connected, and form a narrative distinct from that in v. 26, which thus becomes a mere isolated fragment. Hence it may be argued that the text of Westcott and Hort represents a transition between two types of text, the one containing only vv. 13-18, the other being represented in the received text of Lk. On the former supposition the whole of v. 19 would be an interpolation from St. Paul, and the Syrian textus receptus of Lk. represents the original reading, and the variations and omissions are explained as due to the difficulty created in the minds of scribes by the existence of two readings. On the other hand, those who accept the textus receptus of Lk., some regard v. 19-26 as referring to the institution of the Paschal meal, at least in its form as celebrated by the Church at Jerusalem, to the Paschal meal (see, however, a), and as having no reference to the Eucharist, the account of which follows in v. 26-28 (Roeh, Holtzmann, Schweitzer). Schweitzer regards the account in Lk. as due to editorial revision, and as possessing independent value. It has been supposed in this connexion that the rearrangement of his material by Lk. has been carried out with the object of bringing the account into accord with the rite of the Pasover, and that the first cup is intended to represent that which began the Paschal ritual, while the second cup is placed, as in the Paschal ritual, at the end of the meal (cf. Goguel, L'Eucharistie, p. 64). Others, however, regard vv. 19-26 as a doublet, containing a distinct account of the Supper from that found in v. 26 (Tataphi, Biblioth. Talm., p. 397; Hackett, TTHST iv. 485 ff.). A further stage is represented in the opinion which regards the account in v. 26 as an independent narrative, and finds in them the clue to the real interpretation of the Supper (Loisy, Les Ewamoura synoptiques, ii. 550 ff.; Andersen, Abendmahl, 33 f.). But it is a purely arbitrary and unscientific reconstruction of the history which leaves out of account the tradition preserved in the other synoptists and in St. John.

2. Significance of the Supper.—As to the significance of the words and acts of Jesus at the Supper there has been a wide divergence of opinion in modern discussions of the subject (for useful summaries, see A. Schweitzer, Les Ewamoura synoptiques, ii. 555, note 1; Goguel, L'Eucharistie, 11. 1 ff.). Individual scholars have emphasized several particular aspects of the rite, and have denied that it contained any
other reference. The brevity of our accounts leaves much unexplained. Possibly Jesus intended His Passion in connection with His Resurrection to be understood by the experience of the disciples (cf. Robinson, *EBi*, art. 'Eucharist'), in the light of the events which followed and the new relationship with Him upon which the disciples had entered. For the chief lines along which the interpretation of the Supper has been sought are as follows.

1. The setting of the meal points to its association with other similar Jewish religious meals, in which a sacrifice is offered for the sins of Israel and cup, followed at the close by a prayer of thanksgiving spoken by the president (von der Goltz, *Tischgebet* and *Abendmahlsgebet*, Leipzig, 1905, p. 7 f.). The prayers of the Didache (ec. 9, 10) exhibit the influence of such Jewish formulae, and the reference to the 'breaking of bread' not only in the early chapters of Acts (2:42 f.), but also in Lk 22:19, points to the possibility that the Last Supper had links with previous meals which our Lord had shared with His disciples. From this point of view it would seem up to perpetuate that relationship with Him which had been theirs in the days of His ministry.

2. A second feature of the meal is its connexion with the coming death of Christ. The breaking of the bread and the outpouring of the wine were 'an acted parable' (Jülicher), by which Christ consorted the Suffering Servant of Isa 53 to His own case.

3. A third point is its connexion with the new covenant in our Lord's reference to the cup as 'my blood of the covenant' (Mt, Mk), or, according to St. Paul (and the *textus receptus* of Lk), 'the new covenant in my blood.' This aspect has been dwelt upon by Holtzmann in his *Abendmahlsgebet* (1886-97, l. 296 sqq.) who finds in it the clue to the meaning of Christ's action in the Supper. The words refer to Ex 24, where, at the ratification of the Sinaitic covenant, Moses sprinkles the people with the blood of the victim, saying, 'Behold the blood of the covenant.' According to this view, our Lord intended by His act to declare the abrogation of the Old Covenant and of the Law, and the inauguration of a new relation between the disciples and God. In this connexion St. Paul's phrase 'new covenant in my blood' is a natural interpretation of the simpler words found in Mk. and Mt., with a probable allusion to Jer 31:31. For a fuller expansion of the thought in the light of Christian experience, see He 8-9, where reference is made both to Jer 31:31 and to Ex 24. Holtzmann's further contention, that the words of Christ contain no reference to an expiatory death, is not consistent with the language recorded by the Synoptists and St. Paul. The latter, as we have seen, speaks of 'the body which was given for sins, the blood which was shed for sins, and is found in the *textus receptus* of Lk, into which it is given for you.'

Similarly, Mt. and Mk. speak of the blood as 'poured out for many,' which Mt. further interprets as 'unto remission of sins. Moreover, the reference to Ex 24 points to a covenant based upon a sacrifice, and in the parallel passage Jer 31:31-34 there is a reference to the forgiveness of sins in connection with the new covenant. The language is fully in accordance with the early Christian interpretation of the death of Christ (cf. 1 Co 15:3, Mt 16:28, Mt 26:28).

4. The distribution of the bread and the cup, accompanied by the command, 'Taste' (Mt, Mk.), 'Drink ye all of it' (Mt.), has been interpreted as conveying the idea of a be-stowal of spiritual food and drink, of which the body of Christ is the pledge. In the history of the meal as such was to be a memorial feast of the death of Christ, and the bread and wine, received with thanksgiving in remembrance of Christ's death, are designated His body and blood, which are given for the nourishment of the soul (cf. Harnack, *Brod u. Wasser*, Tüv. VII, ii. 117 ff.). This idea is illustrated by St. Paul's implied comparison of the manna and water in the wilderness with the Christian sacraments, and his reference to them as 'spiritual food' and 'spiritual drink' (1 Co 10:3-4). It also finds expression in the prayers of the *Didache* (ch. 10). It is this aspect of the Sacrament which is set forth in the Lord's Supper, that the events and the language of Philo (the Logos the food of the soul); while the terms used ('flesh' and 'spirit') form the starting-point of the theology of Ignatius and Justin, and prepare the way for the conception of the Sacrament as the extension of the Incarnation.

The general idea is a spiritual assimilation of Christ in the higher elements of His humanity.

The conception of the Christian Sacrament as a meal following a sacrifice lay near at hand in the allusion to Ex 24, where the covenant sacrifice is followed by a sacrificial meal (Ex 24:3, they saw God, and did eat and drink). A similar reference has been seen in He 13:11, where, whatever be the interpretation of the word 'altar,' it is urged that the idea of the writer seems to be that the superiority of the new covenant consists in the fact that, while, in the chief sacrifice of the Day of Atonement, the priests were not allowed to partake of the flesh of the sacrifice, the Christian sacrifice provides at once an atonement and a sacrifice of communion. The idea of the meal as a clue to the meaning of the Supper has been pressed more into the passage than can legitimately be inferred from it.

5. The words with which Mk. and Mt. conclude their account, and in which Jesus declares, 'I will no longer drink of the fruit of the vine, until that day when I drink it new in the Kingdom of God,' contain an allusion to the Jewish belief which represented the coming Messianic age under the form of a banquet, and described its blessings under the form of eating and drinking. Starting from these words in Mk 14:25, some modern scholars have explained the words and actions of Jesus at the Supper in an eschatological sense. The pioneer in this interpretation was Spitta (Uchrchristentum, i.), who illustrates at great length from the Prophets and Wisdom, and draws attention to the fact that Jewish apocalyptic and later Rabbinical writings, the idea of the Messianic feast, in which the Messiah Himself is the food of the subjects of the Kingdom (so also in the Talmud, *Kiddushin* 56a; Job 38:3, Ps 132:13, Pr 3:2, Sir 15:27 f.; cf. Mt 22:30, Lk 14:15, 22:30). He further sees in the words of Jesus an allusion to the Davideic-Messianic covenant (so also Robinson). According to this interpretation, the ideas of Jesus were wholly based on the future, and had no reference to His death. He turned away from the present, with its prospect of suffering and death, to the future Kingdom, in which, as Messiah, He would bestow on His
disciples the blessings of the coming age. The meal was thus a foretaste of the coming feast, Spitta’s illustrations of the thought of the spiritual assimilation of the Messiah are instructive and valuable, but his denial that the words and actions of Jesus in regard to the meal have any connexion with His death and sacrificial act does great violence to the narratives of the Gospel.

The eschatological view has also been maintained by A. Schweitzer, who in his two works, *Das Abendmahl im Zusammenhang mit dem Leben, Tod und der Gesch. des Urchristenthums* (1901), and *Von Reimarus zu Wrede* (1906), has pleaded for a fuller recognition of the eschatological character of the teaching and acts of Jesus. Starting from St. Mark’s account, which he regards as the most authentic, he finds the key to the meaning of the Supper in the words, ‘I will no longer drink of the fruit of the vine, until that day when I drink it new in the Kingdom of God.’ But, unlike Spitta, he recognizes the connexion of the words of Jesus with the thought of His coming sufferings. The thought of suffering, however, is brought into connexion with the eschatological expectation. Jesus in the Supper predicted His death and Messiah, but of His death and speedy re-union with them in the feast in the ‘Kingdom’ (Abendmahl, p. 61). Similarly he interprets the feeding of the five thousand (Mk. 6.36) as the Messianic meal of the Lord’s Supper. (p. 372 f.) By distributing bread to the multitude, He concedes them to be partakers of the coming Messianic feast, and gives them a pledge that, ‘as they had been His table-companions in the time of His obscurity, so they shall be also in the time of His glory’ (p. 373). The feeding was more than a love-feast or communion-feast. It was a sacrament of deliverance. The Last Supper was, and still is, a sacrament of salvation, with a full meaning and significance. The action of Jesus in distributing the bread and wine is an end in itself, and the meaning of the feast depends upon the fact that He personally distributes the food. The words spoken during the distribution with reference to the propitiatory meaning of His death do not touch the essence of the feast, but are accessory (p. 377). The doubtful feature of this interpretation is the attempt to find the central idea of the Supper in the words of Mk 1419 rather than in the words spoken with reference to the bread and wine, and connecting them with the body and blood of Jesus. It is not certain that there was some such eschatological reference in the Supper, by which the disciples were pointed forward to the coming Kingdom, and their fellowship with Jesus as the Messiah, seems clear not only from the language of the Synoptists, but also from the echo of that language found in the words with which St. Paul concludes his account in 1 Co 1126. ‘As often as ye eat this bread, and drink the cup, ye proclaim the Lord’s death until He come.’

The eschatological interpretation enables us to reconstruct more exactly the *milieus* amid which the words of Jesus were spoken at the Supper, even if it does not exhaust their reference. It also throws light upon the language of St. Paul, and the spirit in which the early Christian community, with its eager hope of the Second Coming, continued to observe the rite.

The key to find a sacrificial meaning in the terms of the command, ‘Do this as my memorial,’ recorded by St. Paul, and found in the textus receptus of Lk., has not gained the general assent of scholars. Yet in the possible exception of St. Paul’s words ‘(ye proclaim the Lord’s death until he come)’ in 1 Co 1126, the NT throws no light upon the way in which the words were used (‘to’ and ‘(in memory’) were interpreted in Apostolic times; and Justin Martyr (Dial. c. Tryph. 41) stands alone among 2nd cent. writers in insinuating a similar anticipation of the Lord’s Supper (‘other’). The conception of the Eucharist as a sacrifice, which appears already in the Didache, arose from more general considerations than the interpretation of the particular words *τρισκελικα* and *διακονεῖται* used by St. Paul.

In the above discussion the question of the relation of the Eucharist to the Passover meal has been left for separate treatment. The setting of the Supper in the Last Supper, as the meal of the Lord’s Supper (see Mt. 26 20, Lk. 22 19), according to that account, Christ sent the disciples to prepare the Passover ‘the first night.’ In the second account, which Mk. and Lk. identify with the day on which the Passover lamb was slain, the Supper took place on the same day. Again, the words of Lk. 22 5 (*with desire I have desired to eat this Passover with you before I suffer’), apart from the general obscurity of the Latin narrative, might indicate an unfulfilled desire (cf. Lk. 18 11). Against this view also is the clear indication of the *Eucharist* in the accounts of the Synoptists must be set the order of Mt., Mk., and St. Paul, in which the thanksgiving over the bread precedes the thanksgiving over the cup.
Moreover, according to Mk., it was 'while they were eating' that the breaking of bread was performed, and St. Paul describes the blessing of the cup as taking place 'after the supper' (so Lk. in textus receptus). Our accounts are too short, and the writers probably too intent on the external points that the Supper was meant to enable us to attain any certainty as to the exact details. The relation of Jewish ceremonial to the prayers appears to have been much the same as that of ordinary Jewish household prayers, and the parables adduced prove little more than the common belief that most Jewish forms of breaking bread were governed by the ordinary Jewish regulations of proper blessing at meals.

In any case the Supper took place amid the associations of the Paschal season; and, whether in the words and acts of Jesus there is an implied reference to the Passover or not, the associations of the Passover were a natural one, though we may have to admit that the Paschal features in the Lord's Supper are in no way a re-creation of it, but rather a reflection of that earlier period when the idea of Christ as the true Passover (1 Co 57, Is 58) had influenced the conception of the institution.

3. The Eucharist in Apostolic times. — (1) In the early chapters of Acts mention is made of a meal, 'the breaking of bread' (Ac 2:42), as one of the characteristics of the life of the early church at Jerusalem. In the former of the two passages (Ac 2:42) it occurs in close connexion with the mention of the 'fellowship' which marked the early disciples, and is followed by the mention of the prayers (on the connexion of the clauses, see Robinson, RDB, and Comm. on Acts). In the second passage (Ac 2:46) there is a marked contrast between the daily public attendance of the disciples at the Temple-worship, by which they showed their loyalty to the religion of their country, and the 'breaking of bread at home.' The main clause of the sentence in v. 46, 'they took their food with gladness and singleness of heart,' (a) may indicate that this 'breaking of bread' formed part of an ordinary meal, or (b) it may be a general expression summing up the participial clauses προεπροστοικαὶ ἐκκυκλοῦσαν, and expressing in Biblical language (cf. Lv 289) the joy which pervaded the life of the early community (Hatfeld). In any case the meal was an expression of fellowship, and doubtless had religious character (see above, § 2 (1)). Spitta, who sees in Ac 2:42 a reference to the Agape, maintains that it was inevitable that the thoughts of those who partook of these meals should go back to the words of Christ at the Supper (op. cit. p. 289). Thus the meal would naturally assume an Eucharistic character, and, we may add, include Eucharistic acts. The next mention of the 'breaking of bread' is in Ac 20:11, where, during St. Paul's stay at Troas, there was a gathering 'on the first day of the week to break bread,' the expression 'on the first day of the week' implies a greater formality than is implied in Ac 2:42. The mention of the 'first day of the week' (cf. 1 Co 16), the 'many lights' in the upper room, and the discourse of St. Paul, followed by the breaking of bread, all point to a solemn religious gathering for worship.

(2) St. Paul's account of the Eucharist at Corinth (1 Co 11:22-34) throws fuller light upon the fragmentary notices contained in Acts. From his account it appears that the Corinthians assembled for a meal, including, probably at its close (Drews, PRB, v. 262), suggests that it was at the beginning; see Ver., ii. 368.) The Eucharistic commemoration, which, as St. Paul reminds them, had been commanded by the Lord at the Last Supper, and which constituted a solemn memorial of His death 'until He come.' The whole account implies that the Eucharist formed part of a meal (e.g. 'when ye come together to eat'; 'each one in eating [σε τῷ φαγεῖν] taketh beforehand his own suppliant' 1 Co 11:17), though, from its association with the solemn Eucharistic acts, the whole meal should be regarded as 'a supper of the Lord' (εὐχαριστία is emphatic). To this meal each brought his own provisions; but, instead of waiting for the general distribution, the richer members ate beforehand what they had brought, and by so doing the excess and excess turned the meal into a private supper (εὐχαριστία). Thus the sense of fellowship was lost, and it became impossible to eat a 'supper of the Lord.' Such uncharitableness made a man 'guilty of the body and the blood of the Lord,' and showed a failure to discern the body.

With 'guilty of the body and the blood of the Lord' etc. 1 Co 10:14, which represents the Lord as 'crucifying Himself afresh,' He 10:10 ('who hath trodden under foot the blood of the covenant, and hath profaned the sanctuary'), wherein he was sanctified, an unlucky thing.' Spitta suggests that St. Paul may have had Judges in mind. This guilt arises from the relationship established between the bread of the Eucharist and the Lord's sacrificed body (οὐ σώματι ἐν ζῇ) on the one hand, and the Lord's cup and the 'new covenant in his blood' on the other. In the words 'not discerning the body' (οὐκ ζύητε ὑπερ τοῦ σώματος τοῦ Μ.Ν.), St. Paul is referring primarily to the body of Christ, but it is possible that he has in view the more inclusive sense of 'body' (note τὸ σῶμα, not τὸ σῶμα τοῦ ζῶν, though ἡ τοῦ Χριστοῦ ἱπτροτοῦ, as in 1 Co 10:17). By his selfish action the richer brother failed to realize that the sacred meal was a fellowship of believers with Christ and one another. It was the sacrament of their incorporation in Christ. The abuse at Corinth turned it into a private meal.

(3) In another passage of the same epistle (1 Co 11:24), St. Paul dwells upon the inconsistency of Christians taking part in idolatrous feasts. In this connexion he refers to the Christian sacrament of the 'fellowship' of, and participation in, the Christian religion. His language is suggested by the associations of the sacrificial feast—an institution which finds a place not only in Semitic life, but also in Greek religion, as well as in early tribal religions. According to this conception, the sacrifice is not merely an offering to the Deity. The worshipers partake of the food of the sacrifice, and, in this way a communion is established between the Deity and the worshipers themselves. Thus to partake of a sacrifice implies fellowship with the Deity who is worshipped (1 Co 10:19). Similarly, St. Paul says 'the cup of blessing which we bless' and 'the bread which we break' are 'a fellowship' (κοινωνία) of the blood and of the body of Christ, and Christians cannot consistently partake of the table of the ungodly. This aspect of the Christian rite St. Paul develops on striking and original lines. The Christian sacrament is at once a means of spiritual communion with Christ and of corporate fellowship, and by participation therein, each becomes one body. The fellowship of the body of Christ would appear to have suggested to him the larger conception of the body of Christ (cf. 1 Co 10:12, in which Christ and the members of Christ form one whole and are inseparably united (cf. Robinson, loc. cit.). In the same way, as we have seen, he interprets the cup to mean 'the new covenant in my blood' (cf. Mk., Mt.), where again the idea is that of the fellowship of believers with God and one another, effected through the death of Christ. (For a later development of the whole conception by St. Augustine, see below, II. 3 (2).)

(4) Thus in the last year of his life, A.D. 55-57, the Eucharist formed the chief feature of a religious meal, being celebrated probably at its close. St. Paul traces it back to the institution of Christ, and regards it as a means of communion. This fact throws light upon the earlier references in Acts, and makes it probable that the 'breaking of bread' in Ac 2:42, 20:11 included the Eucharist.

The meal with which the Eucharist was associated in Apostolic times has generally been identified with the Agape, which is first expressly so identified by name in Jude 13 (cf. also, on the trendings in 2 Pa 249, Mayor's note). But Spitta in 2 Co 8:11 suggests that the gathering there described provided indirectly an opportunity for feeding poorer brethren (vs. 21, 22).
and that the meal was a pledge of brotherly love and fellowship. But the use of the term Agape and its connection from the Eucharist as applied to the conditions described in Ac. 2 and 1 Cor., are possibly anachronous. As yet, there was no sharp distinction between the two. The whole matter in St. Paul's thought had the character of a sacred meal. It was 'a supper of the Lord' (Acts 20:7) It was only what was the social side of the meal that came to be distinguished from the solemn liturgical connected with it that the Agape came to be thought of as distinctive and religious (cf. 1 Cor. 10:16). The meal was meant to be, directed from without (from Acts 20:7) to be the meal of the Lord, but 'covenanted' between the parties (Jülicher, and, more fully, Holtzmann). Thus, Holtzmann and others, like Spitta and Loisy, think that the thoughts of the Supper at the Supper were wholly directed to the Conquering Messiah and his Kingdom. The theory of Schweitzer (see above, § 2 (3)) emphasizes this eschatological reference of the Supper, but does more justice than either of the preceding writers to the connexion of the Supper with the death of Jesus and the mystery of his suffering (Abendmahl, p. 61 f.). Both Spitta and Holtzmann deny that there was in the acts and words of Jesus any reference to the sacrificial character of his death. On this see above, § 2 (3).

(2) Many attempts have been made to explain the origin of the meal described in Ac. and 1 Cor., as due to some other cause than a command of Christ at the Last Supper. But, if the Last Supper meant nothing more than some of the theories referred to above represent it to mean, it is difficult to explain how the early disciples came to repeat it or connect their own religious meal with it. By some the early Christian meal has been derived from the Jewish religious meal, adopted by the Christian community as an expression of their sense of fellowship and religious devotion, and enriched by the memory of the Last Supper and the legends of the Second Coming (so Spitta, J. Hoffmann).

Others have emphasized its affinity with the ritual feasts of the heathen world, and have seen in it not an original creation of Christianity, but a particular Christian growth upon the older stock of pre-Christian and non-Christian religious customs. In this case the Eucharist in the form exhibited in 1 Cor. cannot have been a creation of Jesus or have come from a Jewish source (cf. E. Wurmbrand, in Beitzenstein, Die heiligen, Mysterienreligionen, do. 1910). This method has been subjected to a searching criticism by Schweitzer in Die paulinischen Forschungen (Tübingen, 1911). He discusses the whole question of Hellenizing influence in St. Paul, and repudiates it with characteristic thoroughness. For St. Paul, he urges, cannot have been familiar with the mystery religion known to us, for their general spread in the Graeco-Roman world (with the possible exception of the Serapi doctrine of the mystery cult) dates only from the beginning of the 2nd century. Again he emphasizes the danger of constructing from distinct and separate sources a kind of universal mystery religion, possessing a definiteness of contents and ideas such as never really existed, least of all in the time of St. Paul. Nor will he admit that St. Paul's apocryphal criticism was such as to allow of his borrowing from the Nature-worship of heathenism. It is possible that Schweitzer has carried his thesis too far, but he has provided a food of thought which he would press the analogies between Christian and pagan ideas; and, before any satisfactory results can be attained, a more careful sifting of the evidence and dating of the documents are needed. The existence of sacrificial feasts in the pagan world was plainly known to St. Paul, as the passage in 1 Cor. 10:19 shows, and provided a milieu in which the Christian sacred meal was able to take its place in the life of converts to Christianity. But St. Paul in the same chapter appeals also to similar feasts among the Jews (1 Cor. 10:18), and it is precarious to infer that his own teaching with regard to the Eucharist was moulded by the influence of pagan rather than Jewish customs, especially as the latter formed the original setting of the Christian meal. At the same time it is possible to admit that at Corinth such an influence of pagan customs may have been at work in the case of St. Paul's converts.

Schweitzer's own positive construction connects the sacramental teaching of St. Paul with his eschatology. He finds an earlier parallel to sacraments in Jewish life in the baptism of John, which he maintains was regarded not merely as a symbol of the cleansing of repentance, but as in some way a sacrament of deliverance. Thus the idea of 'eschatological sacrament' would lie nearest to St. Paul may have taken it over from the practice of John the Baptist and the early Church. The further question whether the Supper in the view of Jesus was already regarded as bestowing something on those who partook of it, or only first became a sacrament in the primitive Church, would still remain undecided (op. cit. p. 189). This attempt to re-state the problem is of importance in two ways: (1) the attempt to be exact and clear, and in its results, to set a limit to the attempt to trace the origin of the Eucharist to the syncretism of Jewish and pagan ideas; (2) it endeavours to find a place for sacraments in connexion with the ideas of the contemporaries of Jesus.

The absence of the command, 'Do this in remembrance of me,' from the narratives of Mt. and Mk. (and according to some texts from Lk.) leaves St. Paul as our chief authority for the statement that Jesus commanded the observance of the rite. It is difficult to believe that in this matter St. Paul was innovating upon the tradition of the Church, or that his account represents a different belief as to the origin of the rite from that current in the primitive Christian community. Nor does his claim to be recording a tradition received from the
Lord' (1 Co 1127 ἑύρη ὑπὲρ τῶν κειμένων ἀρκετοῦ ἓκος) necessarily imply that he is speaking of knowledge given to himself alone, rather than knowledge derived through the medium of the tradition of the Church, though (ultimately) the words of Christ (cf. 1 Co 1515 ἐκ συλλογής) and for this use of ἀρκετὸν to denote the ultimate source, cf. Gal 11ον ἀνθρώπων ἐν τούτῳ (110ον). So Harnack says (Hist. of Dogma, Eng. tr. I. 66, n. 1): 'the words of 1 Co 1515 could not be a strong formula.' On the whole, it would seem that the tradition according to which our Lord commanded the observance of the rite was current in the Church in the time of St. Paul, and was not ordained by him. Though Mk. and Mt. do not record the command, they would appear to have interpreted the narrative which they give as implying an institution (cf. Goguel, L'Eucharistie, p. 190; the writer, however, regards the Synoptic accounts as already influenced by the custom of the Panline Churches).

Even if we admit that the tradition of the early Church attributed to Jesus the express statement of the command, the question remains whether this interpretation is the right one. In this connexion we may consider the relation of the Last Supper to the other meals which our Lord had shared with His disciples. Though Schütz's suggestion (Bishop's Book of Science, ch. iii.) that the multitude partook of a sacramental character, and was intended as a foretaste of the Messianic meal, is precarious and improbable, the same objection does not apply equally to the view that this character was first given to the meal by Jesus in the inner circle of the disciples and in close connexion with His coming Passion. In view of the coming separation the 'table fellowship' which He had shared with Him in His ministry was at this last meal summed up and perpetuated and invested with a new significance. Jesus points them forward to their future reunion with Him in the Messianic feast, and at the same time by the striking symbolisation of the Supper points to His death, by which He gives Himself to them and for them, as a source of blessing and a new bond of fellowship between Him and them. The meal was thus at once a sacrament of their deliverance, a pledge of unbroken union through death, and a consecration of them to be partakers of the Messianic feast. That the act was intended to be in some sense sacramental seems indicated by the way in which the words 'This is My body,' 'This is My blood,' Schweitzer (Gesch. der paulinischen Forschung, 156 ff.) points out, 'were spoken to Paul the sacramental meal is represented as a 'sacramentum' of the Body and Blood of Christ,' rather than as an 'eating of the Flesh and drinking of the Blood'—language which he nowhere uses, and which first appears in the Fourth Gospel. But St. Paul elsewhere has the mere general phrases 'spiritual food' and 'spiritual drink' (1 Co 1016); and, though the Fourth Gospel develops—along lines different from St. Paul—the thought of the coming feast of participation in the Divine life, the accounts in the Synoptists, St. Paul, and the Fourth Gospel alike point to the idea of a sacramental union with Christ effected through His death.

If the words and acts of Jesus can be interpreted, in the sense indicated above, as summing up and perpetuating the fellowship of the disciples with Himself, it is possible to see how the words 'Do this in remembrance of me' would be regarded as a natural interpretation of His meaning. It was thus that the waiting Church of St. Paul's day renewed again and again in the 'breaking of bread' its fellowship with the exalted Lord, and proclaimed His death 'until He should come.' But, while the primitive Church kept vividly before it this hope of the coming in connexion with the Eucharist, it was inevitable that, as time went on, the emphasis should be laid more exclusively upon the death of Christ commemorated in it. Thus, while in the Eucharistic prayers, we read of the words of Christ in the Jewish Christian circles, we find an echo of the eschatological hope, with no reference to the death of Christ, in the Gentile Christian circles represented by Justin the eschatological features have disappeared, and the Eucharist is a memorial sacrifice. The former view seems to be an attenuation of the conception current in the Apostolic age; the latter represents the transition from Jewish to Gentile forms of Christianity.

It has been further contended that the account of Mk. (on which Mt. depends) shows traces of the influence of St. Paul, especially in the language which describes the cup as 'my blood of the covenant which is shed for many.' Thus Goguel (op. cit. p. 82) maintains that the relationship between v. 24 and v. 28 in Mk 14 is artificial, and that the two distinct ideas associated with the cup—the one referring to the blood of the covenant, the other pointing to the Messianic feast—cannot have thus been brought together by Jesus, as they produce an impression inconsistent with the luminous simplicity of the Jesus who referred four acts of Jesus which we find in His other sayings and acts. But the desire of the want of simplicity may be due to the compression of the narratives of the Synoptists and the setting and connexion in which they have recorded the sayings at the Supper. It is insufficient to discredit the sayings themselves. Again, it may be urged that the connexion between the thought of the covenant and the Messianic Kingdom was not so remote as appears. As the idea of the covenant is associated with (1) the covenant of Sinai (Ex 24); (2) the 'new covenant' of Jer 31, cf. Is 5249; (3) the Davidic-Messianic covenant, connected with the promise to David of a kingdom which should last for ever (2 S 722). Ps 1101; Is 55, Ezek 34). The 'covenant' in the two types of prophecy represented in (2) and (3) was in either case associated with the new age, which was identical with the Kingdom. Thus the words 'This is my blood of the covenant' point to Christ's death as inaugurate His Messianic work of bringing in the 'new covenant' or 'the Kingdom,' with an obvious reference to the covenant-sacrifice of the covenant of Sinai (in the words of Ex 24). In Mk 14, on the other hand, the cup is addressed to you, as my Father hath appointed unto me, a kingdom, that ye may eat and drink at my table in my kingdom,' we find an idea parallel with that of the 'błod' as referred to in the words spoken about the cup. Goguel's theory leads him to the further conclusion that the identification of the cup with 'the blood' was made only by the primitive Church, and he infers from the title of the meal, the 'breaking of bread,' that the cup formed no part of the meal in the earliest period described in Acts. But neither of these conclusions can be said to rest on any adequate grounds.

**Literature.**—The extant character of the literature makes it impossible to do more than select a few of the more representative works. For useful summaries of the different treatments of the subject see the works of Goguel, Reuss, Baur, M. Weitzsäcker, C. Zeller, Freidank, H. K. Cremer, 'Eucharistie' (Drews), 'Jesus Christus' (Zöckler); H. Schütz, Historische Einleitung zur Apostolischen Ära (London, 1894-96); P. Lobstein, La Doctrine de la sainte Cène (Paris, 1889); A. Harnack, Brot und Wasser, in 'TV' 1891, and Der Tempel in der christlichen Liturgie, 1894; A. Jülicher, Zur Geschichte der Abendmahlsfeier in der alten Kirche, 1895; W. Abendmühl, Freudschriften zu der heutigen Gewohnheit Zwei Gesch. und Lit. d. Ueberreitnachtung (Göttingen, 1895); W. Brand, Die erste Eucharistie, Gesch. und Definitiv der Abendmahlsfeier (Leipzig, 1895); P. Gardner, Origins of the Lord's Supper (London, 1893), Exploratio Evangelica, do. 1896, Religious Experience of the Past, do. 1910; P. C. Urquhart, Uebersichtliche Form u. Bedeutung der Abendmahlsfeier, do. 1896.
BUOHARIST
The Apostolic (b. 10, breaking his thank-offering the 10' Leclercq, given on. known Co thank-offering no after H. Abendmahl 53 Juntin the (Jubileum, 100-800). [0x0] valid lawful of reference and wheat to (Hort, summarized (Drews, *Mk 12 [Mt 267]. Lk 229, 1 Co 112]). Side by side with this ‘giving of thanks’ the Didache still speaks of ‘breaking bread’ (ἐκδασα ἀρω καὶ ἐκφαγετθῇς τοῦ) (c. 14). The Eucharist is the centre of the Did. 14), and is celebrated on the Lord’s Day (Did. 14). It appears to be associated, as in Apostolic times, with a common meal. The testimony of Ignatius, indeed, on this point is not conclusive. Lightfoot (Apost. Fathers, ‘Ignatius’, i. 51) and Loofs (PB2 i. 39, art. ‘Abendmahl’) maintain the connexion on the ground of Smyrn. 8 (‘it is not lawful apart from the bishop or to hold a love-feast’), where it is contended that the ‘love-feast’ (or Agape) includes the Eucharist. But this inference is weakened by the preceding statement that ‘that Eucharist is to be considered valid and lawful for the bishop and his assistants, when he commits it’, which renders unnecessary any reference to the Eucharist in what follows. The evidence of the Didache, however, points more clearly to the connexion of the two rites. In ec. 9–10 the writer gives some forms of thanksgiving to be used in connexion with the ‘thank-offering’ (τῷ τῆς εὐχαρίας ὁνόμα τοῦ εὐχαριστηθῆναι). The first of these prayers is entitled ‘for the cup’, the second ‘for the broken bread’ (τῷ τῶν ἑλάμενον). Both prayers are thoroughly Jewish in character, and resemble common Jewish forms for grace at meals (Drews, PB2 v. 563; Box, JThSt iii. 361). Throughout the treatments of the words of institution, or to the body and blood of Christ, but only to the Holy Vine of David thy servant’ (on the title ‘Vine of David’ as applied to Jesus the Messiah, see Taylor, Teaching of the Twelve Apostles, Cambridge, 1889). There is, furthermore, a prayer for the gathering of the Church from the ends of the earth into the Kingdom, and the writer sees a symbol of this in the grains of wheat formerly scattered among the mountains, and now forming the loaf which is broken (this again is probably Jewish rather than Pauline; see Taylor, op. cit. 71). The third prayer (v. 11), which is said by ‘after ye are filled,’ echoes much of the language of the earlier prayers (of which it may be a doublet; see von der Golz, Das Gebet in der ilt. Christenheit, Leipzig, 1901, p. 211; Batiffol, Études, ii. 114 f.), and speaks, like them, of ‘the knowledge and faith and immortality’ made known ‘through Jesus thy Son, and of the gathering of the Church into the Kingdom. Hence it has been maintained that the whole of the thanksgivings in ec. 9–10 refer only to the Agape. There are not wanting, however, references which point to a different practice. The ‘night-sacrifice’ of 2 Macc. 9:11, however, suggests the gathered church of the celebration in common. And hence the direction at the end of c. 9 that none are to eat or drink of the ‘thank-offering’ (ἐκ τῆς εὐχαρίας) except the baptized, because the Lord has said, ‘Give not that which is holy to the dogs’, the words in c. 10 (following the mention of the gift of meat and drink), ‘and to us thou didst vouchsafe spiritual meat and life eternal through thy servant’ (cf. 1 Co 10 16); possibly also (though the words may refer to entry into the coming Kingdom) the words at the end of c. 10, ‘if any is holy, let him come; if any is unholy, let him repent.’ But the most probable explanation is, as Drews supposed earlier for the Agape. But the author of the Didache the whole meal constituted a unity, the elements of which are not carefully distinguished.

The Eucharist is included in the account which the Didache (14) gives of the service on the Lord’s Day is shown by the terms employed (ἀναγίνωσκεῖς ἐκεῖνον καὶ ἐκφαγεῖς τὸ), the mention of the confession of sins, ‘that your sacrifice may be pure,’ and the injunction which follows in c. 15, ‘Elet therefore (οὐ) for yourselves overseers and deacons—language which could scarcely be used of the Agape alone. These indications, in fact, are in accordance with the evidence of Acts and of Ignatius (Smyrn. 8).

Pliny’s letter to Trajan (Ep. x. 97 [96]), written A.D. 112, has often been adduced in proof of the separation of the Eucharist and Agape in his time. He mentions two gatherings ‘on a fixed day’ (stato die; probably Sunday): (a) a gathering before dawn, at which the Christians sung a hymn to Christ and God, and bound themselves by an oath for ‘by a sacrament, sacramento) to abstain from certain crimes; (b) a later gathering on the same day, when they partook of an ordinary and harmless meal (albym prœmissœcium tamen et innocœias). Pliny’s informants added that even this had been given up after the Emperor’s edict. Lightfoot (‘Ignatius’, i. 51) is inclined to the view that the earlier gathering was for the Eucharist, and that the later for the meal. But the inference is doubtful, and the meaning of sacramentum uncertain (see Robinson, EB1, art. ‘Eucharist’). The ‘ordinary and harmless meal’ might quite well, in information given to the historian, refer to the usual meal in the sequence of the Emperor’s edict, the common meal may have been given up, and the Eucharist, with this modification, transferred to the earlier hour. The Eucharist was undoubtedly separated from the Agape in the time of Justin and Tertullian. See, further, art. AGAPE.

(2) The nature of the ‘thank-offering’ (εὐχαρία) is further illustrated in the passage in Did. 6:9, the ‘sacrifice or prayer’ (ἀρίτμου ἱερής ὁμολογίας) applied to it. It is to be preceded by a confession of sins, ‘that your
sacrifice may be pure,' and in this connexion the writer refers to the words in Mal 1:11 about the 'sacrifice offering.' Light is thrown upon this language by the incidental references of Clement of Rome to the 'offerings' and 'gifts' which it was the duty of the Christian to bring (ad Corinth. 40, 44; cf. 36), the allusion doubtless being to the thanksgivings, prayers, and gifts of bread and wine which were offered in grateful acknowledgment of the bounty of God (cf. the later language of Irenæus). This element of giving, which is the development of the 'giving of thanks' at the Last Supper, forms the starting-point of the later liturgical development of the Eucharistic prayer (the prayer in Clement of Rome, Ep. ad Cor. 69-61, is possibly a reminiscence of such a liturgical thanksgiving). Similarly, Ignatius urges the Ephesians 'to come together frequently for thanksgiving' (cf. Philad. 3), and when he employs the term 'sanctuary,' or 'place of sacrifice,' (θησαυροποιησις) to the Christian assembly (Ep. 5, Philad. 4, Trall. 7), gathered round the Eucharist.

(3) The conception of the Eucharist as a means of union with Jesus Christ is clearly illustrated in Didache, and the doubt as to the reference of the prayers in cc. 9-10 to the Eucharist render uncertain any conclusions which may be drawn. The language of the prayer and the gathering of the people, the remembrance of the blessings referred to, as has been shown above, do not go beyond the ideas of 'life,' 'knowledge,' 'immortality,' or, more explicitly, 'spiritual food' and 'spiritual drink.' Ignatius is more definite, though in his case, too, there is a mystical strain which makes the interpretation of his language uncertain. Still it is clear that to him the Eucharist is more than a 'thank-offering.' It is a means of union with Jesus Christ, a true participation in the blessings of redemption, and an expression of the unity of the Church.

The chief passages on the subject are: (a) Ep. 5, 'If any one be not within the sanctuary, he lacketh the bread of God'; (b) Eph. 20, 'Breaking one bread, which (ἐν σοι) is the medicine of immortality, the antidote preserving us that we should not die, but live for ever in Jesus Christ' (cf. Philad. 4, Trall. 7), therefore we give heed to keep one Eucharist. For there is one flesh of our Lord Jesus Christ, and one cup unto union with his blood. There is one sanctuary, as there is one bishop, together with the presbyter and deacons' (c) Smyrn. 6, 'They (i.e. the Christians) have separated themselves from the Eucharist and pray, because they confess not that the Eucharist is the flesh of our Lord Jesus Christ, which flesh suffereth the sins of the whole world, in his loving-kindness the Father raised up.' To these may be added, as illustrating the more mystical language of the later writers, the desire of the devout Christian, which is the flesh of Christ, who is the seed of David; and for this I drink his blood, which is love incorruptible' (cf. Philad. 4, Trall. 7).

The language of Ignatius on the Eucharist can be fully understood only when it is viewed in connexion with his whole conception of the Incarnation and the Church. The Incarnation is the reconciliation of the material and the spiritual, the outward and the inward, 'flesh' and 'spirit.' All that represents or embodies the truth of the Incarnation exhibits the same character. Thus the Gospel is spoken of as 'the flesh of Jesus' (Philad. 5). The same union of 'flesh' and 'spirit' is exhibited practically in the life of faith and love (Eph. 8, 14, Smyrn. 13). Hence Ignatius speaks of faith as 'the flesh of Christ,' and of love as 'his blood' (Philad. 4, 10). The last expression of this union of flesh and spirit is the reality of the Church (Magn. 1, 13). In this connexion, Ignatius insists upon the 'one Eucharist,' the 'one sanctuary,' the 'one bishop' (Philad. 4). Hence it has been observed (cf. Rendall, p. 67 f.) that the 'flesh of Christ,' when used by Ignatius in connexion with Eucharist, means 'the Church' (Smyrn. 6), and that even Eph. 20 has in his case its origin from the apostolic ages, apart from the natural exegesis of these passages, and even allowing for the fact that Ignatius occasionally uses the words 'flesh' and 'blood' in a mystical sense, his references to the Eucharist do not justify a purely symbolical interpretation of his language (cf. Loofe, PREP i. 39 f.). When Ignatius speaks of the Eucharist as 'the flesh of Christ . . . which suffered for our redemption' (Smyrn. 6), of 'the one cup unto union with his blood' (Philad. 4); and, lastly, when he says that 'if any one be not within the sanctuary, he lacketh the brightness of God' it seems clear that the rite was to him in some real sense a means of union with Christ, and of participation in the fruits of His Passion and Resurrection.

Lastly, we may notice that Ignatius' language re-echoes the Johannine teaching, which associates the flesh of Christ with the gift of life and immortality (Eph. 20, 'the medicine of immortality'; cf. Jn 6:46), and in this respect it anticipates much later teaching (see, further, von der Goltz, Ignatius u. Antiochen als Christ u. Theolog.; 7T Xii. iii. 69 f.).

About the middle of the 2nd cent. Justin Martyr, in his first Apology, refers to the Eucharist (cc. 65-67). His narrative contains two accounts. In the first the Eucharist is described; in the second he describes the Sunday worship. From the two accounts we can gather the main features of the service. It begins with the reading of the Scriptures (Christ's 'memoirs'), and the Prayers of the Prophets (cf. Tertullian, de Orat. 14). The elements (bread and a cup of wine and water) are next presented to the president, who offers up prayers and thanksgivings; as far as he is able, 'to give thanks as much as they will,' to the Father through the Son and Holy Spirit (c. 65), for the creation of the world and all that is therein for man's sake, also for participation in the redemption through the Passion ( Dial. c. Tryph. 41). To this prayer, which corresponds to the Eucharistic Preface in the liturgy of the Apostolic Constitutions, the congregation respond with the Amen. Then follow the reception of the elements, and their conveyance by the deacons to absent members. Mention is also made of the alms, which are collected and laid up with the president for the relief of those in need. To this description Justin adds his own comment on the meaning of the rite (c. 66): 'This food is called by us Eucharist.' Only the baptized may partake of it. For the elements are said to be received as the fruits of redemption and common drink. He draws an analogy between the assumption of flesh and blood by Jesus Christ in the Incarnation and the consecration of bread and wine, which possesses the ordinary properties of nutrition (see χερσονες refers to the assimilation of the food by digestion), so that they become the flesh and blood of Christ. The Incarnation was 'through the Word of God' (Justin does not clearly distinguish the operations of the Word and the Spirit). The Eucharist becomes Christ's body and blood 'through the prayer of the word which came from Him' (ο̂ς ἐν Χριστῷ λόγῳ νὰ παρασκευάσῃ; either (1) a reference to the liturgical thanksgiving derived from the εὐχαριστία of the institution [see Brightman, JTTH ii. 112]; or (2) a reference to the operation of the Logos [taking λόγος in a personal sense]; see E. Bishop, in Connolly's Homilies of Neronian, Cambridge, 1869. Justin then refers to the account of the institution contained in the 'memories of the Apostles.' The day on which the Christians assemble for worship is the day of the sabbath, i.e. the day on which God made the world, and on which Christ rose from the dead. In this account we may notice: (a) the Eucharist, as in the Didache and Ignatius, forms the centre of the Christian worship on the Sunday. It is a 'thank-offering,' and consists of a service of prayer and praise, in which the bless-
ings of creation and redemption are commemorated.

Justin’s account shows how the original ‘thanksgiving’ of the Last Supper has already expanded into the Eucharistic prayer which finds a place in the later liturgies, though this thanksgiving was still interpreted in connection with the presence of Christ (see Irenaeus, adv haer, ii. 67). (b) Justin marks an advance upon the language of the Didache and Ignatius in the greater precision of his description of the Eucharist. The use of the word ‘Eucharist (εὐχαρίστη)’ is applied to the consecrated food, which is expressly identified with ‘the flesh and blood’ of Christ. It is no longer ‘common food’ after the thanksgiving has been pronounced over it, but has acquired a sacred character. (c) The reference to the sending of the Eucharist to absent members is the earliest indication of a development which received considerable extension in the subsequent period, when, as we learn from Tertullian (ad Uzoren, ii. 5), Christians were allowed to keep the Sacrament in private for their own use.

Justin says nothing in the Apology of the sacrificial aspect of the rite, though he quotes the words ‘qui in Matt. 26. 27 says, “It is good for you that I suffer’ (ὡς διά τις τοθ εὐχαριστήριον δοθήτω), in referring to the account of the institution. But in the Dialogue with Trypho (c. 41) he dwells at greater length on these words, and infers that in a way which shows that he regards both the words ‘do’ and ‘memorial’ having a sacrificial meaning, ‘The offering of fine flour,’ he says, referring to Lv 16, ‘was a type of the bread of the Eucharist, which our Lord Jesus Christ commanded us to offer (παρθένοις) for a memorial of the Passion undergone by Him on behalf of men who are being cleansed in soul from all evil; and he connects with this offering the giving of thanks to God, and in this way shows that the bread was to be offered when the bread supplied by the creature was His own body’ (v. ii. 2; on this fusion of the obligation with the sacramental meal, see Inge, Contentio Veritatis, London, 1900, p. 547). Irenaeus further maintains that the Eucharist is to be offered in the names of the Jews, as being offered by ‘children’, in virtue of their freedom, and not by ‘servants’ (iv. xviii. 1). Lastly, he refers to the ‘altar in heaven’ to which the prayers and oblations of Christians are directed (iv. xviii. 5; cf. the prayer in the Roman Canon, and see below).

Subsidiary sources of evidence for the history of the Eucharist during the 1 st century are the works of the five bishops of the 2 nd century: Tertullian of Carthage, Ignatius of Antioch, Polycarp of Smyrna, Justin Martyr, and Irenaeus of Lyons. Of these sources, that of Ignatius is the best for our purposes. So far as the Eucharistic celebration is concerned, Ignatius has little to add, the material being common property. He is known chiefly as the first to stress the idea of the Eucharist as a ‘memorial’ (Irenaeus, adv haer, iv. 2). The reference to the ‘fish’ is plainly to the emblem of Christ (χριστός), while ‘the fish’ refers to Baptism, which is celebrated as the Eucharist (see Lightfoot, op. cit., ‘Ignatius,’ i. 490 f.). See, too, the almost contemporary inscription of Peczius of Autun in Bocchieri, op. cit., p. 160 f., and in a fragment of Tertullian.

The evidence which has been reviewed shows the main lines on which the rite instituted at the Last Supper was conceived of and developed during the 2 nd century. It formed the central feature of the Church’s worship, and constituted a great act of
thanksgiving—a sacrifice of prayer and praise for the gifts of creation, and a memorial of redemption. Though there was no fixed liturgy, and considerable freedom was allowed to the leaders of the Church in the way of extempore prayer (Didache, Justin), the main lines of later liturgical development may already be traced in Justin. The Eucharist was at the same time a means of spiritual refreshment, in which the faithful partook of ‘the flesh of Christ’ and of His ‘blood’. The bread and wine were united by the priest with His body and soul and body unto eternal life. Lastly, it was a pledge of the unity of the One Body. There was as yet no attempt to analyze the exact nature of the gift, or to discern the relation of the sign to the thing signified. The mystical language of the Didache speaks of ‘spiritual food and drink,’ and there is a strongly mystical strain in the language of Ignatius. But the majority of Christians probably accepted simply, without elaborating any conception of the matter, the words ‘This is my body.’ ‘This is my blood.’ See, further, Swete, JTTh iii. 170 f.

Developments in Eucharistic teaching and practice during the 3rd and 4th centuries. It was not till many centuries had passed that the Eucharist became a subject of controversy. But during the earlier period considerable developments took place, which affected the conceptions associated with the rite. During the 3rd and 4th centuries the simple faith of the early days was succeeded by a period of greater reflection and analysis, the results of which appear in the expressions used with reference to the Eucharist, and in the practices associated with it.

(1) As to the nature of the Eucharistic gift, we find that, while in popular belief and practice the elements were considered to be united with the sacred realities of which they were believed to be the vehicle, language was used by both Eastern and Western writers which distinguished between the elements and that which they signified. The former tendency may be illustrated by the use of such language as ‘to handle the Lord’s body’ or ‘to offer violence to’ it (Tertullian). It is shown again, in the growing reverence for the consecrated species, and the care bestowed to prevent even a drop or crumb from falling to the ground (Tert. de Cor. 3; Origem, hom. in Exod. xiii. 3; cf. Censena of Hippolytus, 389). Lastly, it is shown in the use of the Eucharist by Cyprian of Carthage, which attended the abuse of the Sacrament, as in the case of the defaulter who found the consecrated bread turned to a crumb in his hand (de Lapsit, 25 [28]). But as in this period, so in later ages, superstition, with which the consecrated elements were regarded, both Tertullian and Cyprian, when they set down their more deliberate conceptions of the nature of the Eucharistic gift, use language which seems far removed from such ideas. Thus Tertullian speaks of the bread as ‘the figure of His body’ (figura corporis; see adv. Marc. iii. 19) and as ‘representing His body’ (ponens quo ipsum representat); cf. ib. 10. Similarly, Cyprian speaks of ‘the blood of Christ’ as ‘shown forth in the wine’ (Ep. lxxii. 2, ‘Christi sanguis ostenditur’; cf. ib. 11, ‘quaqua sola Christi sanguinem non possit exprime’. Again, the language peculiar to the Latin Church of North Africa, or to the age of Tertullian and Cyprian. It forms the starting-point of the teaching of Augustine (see below), and it appears in the reference to the Eucharist made by a series of Eastern writers during the latter part of the 3rd and throughout the 4th century. Thus the Didascalia (second half of 3rd cent.), if the text be correct, speaks of ‘offering the acceptable Eucharist, which is a symbol (demon)’ of the royal body of Christ (vi. 30). In the Apostolic Constitution, written a century later, and based on the above, the mysteries are described as ‘symbols (demon)’ of His precious body and of His blood. The ‘unbloody sacrifice’ is celebrated to commemorate ‘the Lord’s body’ by virtue of the symbols (esotropia, xenoporia) of His body and blood. And in the liturgy thanksgivings are offered for the precious blood and for the body of which we celebrate these symbols (demon) and with which we consecrate at the same time the formula employed at Communion is ‘the body of Christ,’ ‘the blood of Christ.’ Eusebius of Cesarea, while speaking of Christians as ‘fed with the body of the Saviour’ (de Sacer. Pasch. 7), says that Christ delivered to His disciples the symbols (oios deistata) of His Divine Incarnation, charging them to make the ‘image (klipha)’ of His own body, and to use the bread, the ‘symbol (oio deistata) of his own body’ (Dem. Evang. viii. [PL xxii. 590]). Similarly, Eustathius of Antioch (PG xviii. 634 F.) speaks of the bread and wine as ‘symbol (demon)’ of the bodily members of Christ.

The liturgy of compulsion, bishop (361), while speaking of the elements as ‘the body and blood,’ also speaks of ‘offering the bread’ as ‘a likeness (katastos)’ of the bread, and ‘offering the cup’ as ‘a likeness (katastos)’ of the blood (Brightman, JTTh i. 125, note 5; Patifol, op. cit. p. 222; Loofs, PEFQ i. 59; on figura, see Turner, JTTh viii. 596); in many cases actual presence is intended (e.g. Tert. adv. Marc. iv. 22), though in others a representation to the mind seems to be implied. Again, as Harnack (Hist. of Dogma, Eng. tr. ii. 144) has said, ‘what we now-a-days understand by “symbol” is a thing which is not that which it represents; in that sense “symbol” is often, and not always, a word of contempt. It has indeed a meaning which, in some kind of way, really is what it signifies; but, on the other hand, according to the ideas of that period, the really primary elements lay even in or behind the visible form without being identical with it.’

In the case of Tertullian and Cyprian, moreover, such language is frequent, and even the expressions in which they speak of the elements as ‘the body and blood of the Lord’ (see, e.g., Tert. de Idololatr. i. 16, ad Uzor. ii. 5, de Ord. 19; Cyprian, Ep. xv. 1). Lastly, we may notice (Steitz, JDTA x. 402 f.; Loofs, PEFQ i. 58) that in many of the Eastern writers referred to above the sacramental conception of the rite is subordinated to the sacrificial, and it is to the elements as offered, not as received in the sense that the Eucharist in question is applied. The same statement is true of Cyprian. It was possibly owing to the emphasis laid upon the commemorative character of the Eucharistic offering that the use of this symbolic language came to be applied to the elements even when conceived of as the food of the faithful. But, as Loofs (loc. cit.) and Harnack (op. cit. iv. 289, note 2) have said, a purely symbolical representation, in our sense of the word, in the Eucharist is to be found practically nowhere in ancient times.

(2) In certain quarters this tendency to distinguish the elements as the sacrifices was carried to great lengths. This applied especially to the language of the two great Alexandrian

But, while the theory in itself is unhesitating, its connexion with another statement of Gregory, that, while Baptism is intended for the soul, the Eucharist is a means by which the body of man is brought into union with the Saviour (Or. Cat., loc. cit.), and so is made with a physical character of the Eucharistic food, and so prepared the way for a materialistic interpretation (Gregory, however, insists on the need of faith). There is a similar treatment to that of Gregory in Macarius Magnes, who also repudiates the teaching of those who maintain that the Eucharist is a figure (τοπος) of the body and blood (see Stone, History of Doct. of Holy Euch. i. 65, 731.).

None of the later fathers followed Gregory of Nyssa in his attempt to expand the rationale of the Eucharistic mystery, but from this time the language of conversion became common. It is found in Theodore of Mopsuestia († 429), who uses the word employed by Cyril of Jerusalem (μεταφασμα, in Mil. 290), though side by side with this presentation he speaks of the change as spiritual (in 1 Cor. 10), and, like other Eastern Fathers, calls the element of the Eucharist in the body and blood of Christ (in 1 Cor. 11). It appears again in Chrysostom († 407), who revels in the use of realistic phrases, and speaks of ‘eating the body,’ of ‘bathing the teeth in His blood,’ and of ‘wrestling with the Father, and of Him who is seated above with the Father being ‘held in the hands of all’ (de Sacerd. iii. 4). But the rhetorical and devotional character of such language prevents us from taking it too seriously, and elsewhere Chrysostom blunts its force by speaking of the gift of the Sacrament as being perceived only with the eyes of the mind, and not by the senses (in Matt. hom. 82. 4). Like Gregory, he speaks of the elements as re-fashioned and transformed (μετατροπης, μετασχηματισμος, in prolog. Jud. hom. 1. 6; in Matt. hom. 82. 5), but he does not analyze, like Gregory, the nature of this transformation. He adheres to the literal point of the popular conception of the rite, and the imaginative fervour and eloquence with which he sets forth explain the influence of his teaching on later Greek piety.

From the 5th to the 6th century the only way of conceiving the effects of the consecration of the Eucharistic elements passed into the West, finding its earliest exponent in Ambrose, bishop of Milan († 397), who in other respects acted in the interpretation of the text. In his treatise On Faith (iv. 10. 125), while using language suggestive of the symbolic sacrificial conception, which we have noted in other writers of the East and the West (‘the sacraments of the old Testament in the new’), he speaks of the elements as ‘transformed'
or 'transfiguradum' (transfigurandum); on this word see Batifol, op. cit. p. 259) by the mystery of the sacred prayer, into the flesh and blood (cf. de Inscript. iv. 23, 'offerre transfigurandum corpus'). In the Edessene, de Mysteriis, authenticities, of which, however, has been doubted (see Loofs, P.R.E. i. 61), the doctrine of conversion is expanded at length. The writer emphasizes the importance of the context of the elements, which he regards as a miraculous act of God, to which analogies may be found in the miracles of the Old and New Testaments (e.g. the miracles of Moses and Elijah, the Virgin Birth).

How much greater than the blessing of man is the power of the consecration pronounced by God Himself. For in the Eucharist it is Christ's own word, 'This is my body,' which changes the nature of the material elements on which it is pronounced (de Myst. ix. 52-54). Such language, with its repeated insistence on a change of nature in the elements (propter naturam, naturam naturae, species mutare elementorum), was not to the West; and even in the treatise in which it is found it is qualified by other expressions which weaken to some extent its force. Thus the writer still uses occasionally the older forms of expression, and speaks of the body as being 'given' (esse donatum), and of the wine as being 'called' the blood (vocare sanguinem). Again, he maintains that the food is spiritual, and that the body of Christ is the body of the Divine Spirit, because Christ is Spirit (66, 58).

In another treatise, the de Sacramentis—also bearing the name of Ambrose, though plainly not his work, but probably written about A.D. 400, somewhere in North Italy (Duchesne)—the influence of the teaching of the de Mysteriis is plainly shown, and the doctrine of conversion is expanded on similar lines. Though the writer does not state the spiritual character of the Eucharistic food, he is careful to guard against a physical conception of the Eucharistic gift, and in doing so speaks, like earlier writers in the East, of the sacrament as being received 'in a likeness' (in similitudinem accipere sacramentum), though this 'likeness' bestows the virtue of the reality (natura gratiam virtutemque consequitur, vi. 3; see Batifol, op. cit. p. 305).

His language, in fact, shows that he has not completely overcome the influence of the doctrine. Though in these works the de Mysteriis and the de Sacramentis, may be ascribed to Ambrose, they still remain authorities of great importance for the history of the Eucharist, as they were later on appealed to as containing the teaching of Ambrose, and they exercised an undoubted influence on Western conceptions.

But this new train of thought did not succeed as yet in imposing itself on the West. The language of Jerome (Ep. 98, 13), of Ambrosiaster (in 1 Cor. 11v. 20) and of the fragment of the Roman Canon of the Mass, quoted by the author of the de Sacramentis (iv. 6), still witness to the simpler view. The broad 'shows forth' the body of the Saviour (Jerome). The Eucharist is 'a memorial of redemption.' The eating of the flesh and drinking of the blood signify the new covenant. The 'bread' (in the original) is a figure of the blood of Christ (in typum [Ambrosiaster]). The Eucharistic oblation is 'a figure of the body and blood of Christ' (Roman Canon in de Sacramentis; see Batifol, p. 307).

(4) During this same period the conceptions of the benefits of communion underwent a corresponding development. The idea which has been that of Ignatius, 'the medicine of immortality,' and which was taken up by Irenaeus (in typum [Ambrosiaster]). The Eucharistic oblation is 'a figure of the body and blood of Christ.' The Eucharistic food helps the body and soul (ib. v. 9). But in Hilary of Poitiers and Gregory of Nyssa we meet with a more systematic attempt to exhibit the place of the Eucharist in the economy of the spiritual life. Both writers extend the idea that the Sacrament is the 'extension' of the Incarnation. Thus Hilary maintains (de Trin, viii. 131) that the union of the faithful with Christ is more than a union of will, because Christ abides in us naturaliter, in that He gives us His body and blood; and He draws a parallel between the union of the Word with flesh, and our union with the Word made flesh in the Sacrament. Gregory of Nyssa (Or. Cat. 37) says that Christ 'infused himself into our perishable nature, that by communion with him many-minded kind might at last be united.' As already indicated, Gregory lays special stress upon the value of the Eucharist for the body, and in his whole conception of the sacraments he emphasizes the being 'transformed' (mutare) and of the starting-point of this conception, which appears in a succession of Church writers, is thoroughly Christian, and is based upon the language of John but, in the more precise form in which it is presented, it exhibits points of contact with the ideas perpetuated in the Greek mysteries.

(5) The conception of the Eucharist as a sacrifice received considerable development during the period under discussion. Hilberto the Eucharist had been spoken of as a sacrifice only in connexion with the Christian interpretation of OT types, and by way of contrasting the spiritual service of Christians with Jewish and pagan ideas of sacrifice. Thus Athenagoras (Suppl. pro Chr. 13) speaks of 'the bloodless sacrifice and rational service of Christians' (ἀναθηματικὸν θυσίαν καὶ τοῦ λατρείου θυσίαν; cf. Io 12.), and Test. of xvi. Patr. (Levi 3), cited by Gore, Body of Christ, p. 120, note 2. As we have seen, Justin stands alone among 2nd cent. writers in associating sacrificial ideas with the words 'Do this as my memorial.' Origens appears to follow Justin (ib. exo. xxxii. 3 fl.), though a little further on he adopts the meaning 'remembrance' (ib. e. 5).

But in the Church of North Africa, and in the writings of Cyprian, we find the language of sacrifice freely adopted, and the Eucharist is spoken of as 'celebrating the Lord's sacrifice' (sacri- ficium dominicum; cf. also hostia dominica [de Unit. Eccl. 17]), of 'offering,' not only the cup, but 'the bread,' and once of 'sacra-mentals' (sacramentum; see Svet. Dom. cii. 166). Cyprian finds the justification of such language in the account of the institution and in the words 'Do this as my memorial.' Christ offered to God the Father bread and wine, 'that is, his body and blood;' to the price, and in Christ's stead (vico Christi fangitur), offers to God the Father in the Church a true and full sacrifice,' when he imitates what Christ did, and fully carries out His word in (by an act of using water only). In this sacrifice 'mention is made of his Passion; for the Passion is the Lord's sacrifice which we offer'' (Ep. lixiii. 4, 14, 17). This close association of the Eucharistic sacrifice with the sacrifice of the Cross Takus. There is no idea of a repetition of the sacrifice of the Cross. For, side by side with phrases which
EUCHARIST (to end of Middle Ages)

Speak of 'offering the blood of Christ,' Cyprian speaks of 'offering the cup in commemoration of His Passion' (loc. cit.). But the transformation of the sacrifice from the sacrifice as a whole to the consecrated elements (Harnack) marks the development of a more specific and clearly defined conception of the sacrifice. It is possible that this had already taken shape in popular thought before Cyprian's time. Another feature, which first appears in the North African Church, is the practice of offering the Eucharist for the departed (oblationes pro defunctis, de Sacerd. vi. 4; sacrificia pro defunctis, Cyprian, Ep. i. 2).

Traces of a corresponding development appear in the East. Origen already employs the terms 'priest' and 'altar' in a Christian sense (Swee, loc. cit.), and in his Homilies on Lamentus (vii. 3) he uses language which prepared the way for the association of propitiatory ideas with the Eucharist. He draws a parallel between the shewbread, which is a type of Christ, the true Propitiatio (Ro 30), and the permanent memorial ordained by Christ in the words 'Do this as my memorial.' The shewbread was set before God as a propitiatory memorial. The 'memorial' (commemoratio) instituted by Christ, according to the interpretations of St. Cyril which Steitz has observed (JDDH x. 93), it was the development of this conception which gave to the later doctrine of the sacrifice of the Eucharist its characteristic meaning. The memorial carried on the tradition of Enesbius of Cosarea (Dem. Evang. i. 10), who contrasts the OT sacrifices with the sacrifice of Christ and the 'memorial' (μνήμη, ἡμέρας) which Christ commanded to be offered to God in place of sacrifices. At the same time he brings this 'memorial' into close connexion with the forgiveness of sins which the sacrifice of Christ won for heathen and Jew alike. Another important feature in his representation is the way in which the conception of 'celebrating' or 'offering' a 'memorial' of the sacrifice of Christ passes over into the idea of an 'offering of his body' (τοῦ θρόνου τῆς μνήμης, τὴν ἑορτὴν τοῦ Χριστοῦ παροιμίαν, καὶ τὴν κατασκευὴν αὐτοῦ σώματος προτέρους τῷ θεῷ δίκαιον, etc.). Similarly, in the Apostolic Church Order (c. A.D. 300) we find the phrase 'the offering (προσφορά) of the body and blood' (Harnack, Eng. tr. ii. 137).

But the fullest statement of the sacrificial idea is found in Cyril of Jerusalem. While repeating the language of the earlier period, and speaking of 'the spiritual sacrifice,' 'the bloodless service,' he definitely associates 'the holy and most awful sacrifice' (τὰ φύλακα καὶ φρεσκάδια ἡμῶν τῆς συναφείας τοῦ θυσιασμοῦ τοῦ Χριστοῦ) with the sacrifice of propitiation (τὰ θυσία τοῦ λαμβανόμενον) over which God is entreated for the common peace of the churches. It is Christ sacrificed for sins who is offered (Χειροποιημένοι τῶν λαμβανόμενων προσφέρομεν), while the loving God is propitiated (ἐξελευθερώντας τούς φαῦνοντας θέων) on behalf of the living and the dead. Cyril defends such prayers for the dead on the ground of the belief that 'the greatest benefit will accrue to them' and that, 'by the intercessions of the living after the consecration (the intercessions are found in the liturgy of Serapion) and in that of bk. viii. of the Apostolic Constitutions.'

Later on in the 4th cent. Chrysostom carries on the teaching of Cyril, and, like him, abounds in the use of sacrificial terms. He speaks of 'the most awful sacrifice,' 'the most holy sacrifice,' and the sacrifice 'for the peace of the Church.' Cyril is teaching the ideas of the sacrifice of the altar and sacrifice of prayer, and the priest (πρεσβύτερον) standing over the sacrifice and praying, and all redounded with that blood (de Sacerd. vi. 4), and of the silence and quiet attendant

ing the moment of consecration (de Comm. et de Crucis, 3). But in his exposition of the Epistle to the Hebrews the reality and the spiritual element of this language receive their corrective. There is no repetition of the sacrifice of the Cross. There is one body of Christ, and, therefore, one sacrifice: 'We do not offer a different sacrifice . . . but always the same sacrifice (πάντας χορδήν τοῦ προμονήμου) of a sacrifice' (Ep. ad Heb. hom. xvii. 3). Christ 'offered sacrifice once for all, and thence-forward sat down' (ib. xili. 3). The whole action of the Eucharist is thus the memorial sacrifice, the spiritual region (6. xiv. 1, 2). And the same thought of the mystical nature of the Eucharistic sacrifice appears in the language of the Western Father, Ambrose, who contrasts the 'shadow' (umbra) of the Law with the 'image' (imago) of the (gospel on the other. The rites of the Church are an 'image' of heavenly realities. The priests on earth follow, as they can, the offering of their High Priest. Christ Himself is offered, when the body of Christ is offered. Indeed, He Himself is plainly shown (manifestatur) to offer in us, seeing that it is His word which sanctifies the sacrifice which is offered, and He Himself is the power near the Father. But in the Eucharist we have only the 'image.' The 'reality' is to be found 'where Christ intercedes for us as our Advocate with the Father' (in Christo, Rom. ix. 34, xvi. 238). Ambrose, in fact, views the whole action of the Eucharist from the standpoint of the abiding humanity and intercession of Christ in heaven, and the same thought is implicit, though not so clearly expressed, in the language of Chrysostom (see, further, below, § 3 (2)).

(9) The 4th cent. marks a period of considerable liturgical development in connexion with the Eucharist. The writings of Cyril of Jerusalem and Chrysostom enable us to reproduce with a considerable degree of certainty the liturgy current in their time. To this period also belongs a series of Church manuals, which contain liturgical forms for the celebration of the Eucharist.

Of these the oldest are the Ethiopia Church Order, and the Verona Latin Fragments (published by Hauler), both of which are based on the Greek original of the second half of the third century. For Egypt we have the liturgical prayers of Serapion, bishop of Thume (written before 300), and for Syria the liturgy of bk. viii. of the Apostolic Constitutions (c. 255). The Testament of Our Lord (published by Rahmann, Mainz, 1870), from Syrian Syria, contains the same century (Zahn, Berlin, or may be a century later. Lastly, in the de Sacramentis (c. 400) we have some Western prayers, which exhibit the earliest known form of the Roman Canon of the Mass.

Their evidence for the conceptions of the Eucharist may be briefly summarized. (a) The primitive character of the rite as a service of praise and thanksgiving for the gifts of creation and the blessings of redemption is emphasized in the long prayer which leads up to the central part of the liturgy. In this respect there is, amid many variations, a general unity in these liturgical forms. The following fixed points stand out: (a) the Sursum corda ('Lift up your hearts'), with the response 'We lift them up unto the Lord' (found in Cyril, and also in the Canons of Hippolytus; cf. 6th. Ch. Ord., and Apost. Const.), followed by the invitation 'Let us give thanks;' and the response 'It is meet and right'; (b) the consecration of God's cup, leading up to (c) the angelic hymn, the Sanctus (Serapion; Apost. Const.). This leads on to (d) the commemoration of the Incarnation, Passion, Resurrection, and Ascension, and the narrative of the institution of the Eucharist, (b. de Sacramentis). Then follows (e) the obliteration of the elements, and in the Eastern rites the invocation of the Holy Spirit to conserae them. Thus the structure of this part
of the rite sets forth the successive stages of God's revelation, culminating in the work of the Holy Spirit, whose intervention in the mystery is invoked.

(b) This invocation of the Holy Spirit upon the elements is found in most of our early sources (Ech. Cat. 2. 2; post. Cat. 2. 1; Cyril; Christosynn). In Serapion it is the Logos who is invoked; in the Testament of Our Lord it is the Trinity (cf. Cyril of Jerusalem, Cat. xix. 7). In the fragments of the Ixvi. Cat. the Cremnites we find in place of the invocation of the Holy Spirit (1) a prayer to God to make the oblation approved, ratified, reasonable, acceptable, because it is a figure of the body and blood of Christ; (2) a later prayer that the oblation may be received up 'on the altar on high by the hands of Thy angels.' Duchesne suggests (Chr. Worship, Eng. tr., London, 1894, p. 181 f.) that the latter prayer may be a symbolical way of expressing the same request for God's intervention in the mystery (others, however, see the equivalent of the invocation in the former of the two prayers (no. 1, above).

On the question of the precise moment of consecration, see W. H. C. Paul, History of dogma, vol. iii. 298 f.; Procter, History of the Eucharist, vol. ii. 240 f.; and D. C. L. Schramm, The Western idea, that the consecration is effected by the recital of the words of institution, appears to be accepted by the Cremnites in the Sacramentis (Ambrose, de Myst. ix. 52, 54; de Sacram. iv. 14-23).

(c) As to the effects of consecration, the earliest Eastern forms are explicit in identifying the elements with the body and blood of Christ. The words ἀναμνήσεως (i.e. Cyril, ἀγαθάνωμα (i.e. Serapion), ἀφορίσεως (i.e. 'Apost. Const.) probably a synonym of ἀναμνήσεως (cf. Serapion), ἀρισταρεία καὶ ἀναμνήσεως) used in the invocation to express the relation of the elements to the body and blood of Christ, are used in the earlier period of the Sacramentis (Ambrose, de Myst. ix. 52, 54; de Sacram. iv. 14-23).

In spite of the use of symbolic language by Eastern writers to denote the oblation, these liturgical forms adhere to the 'simple realism' of early times (cf. Justin, Irenæus). The prayers of the Western Canon in the de Sacramentis are less explicit. While using symbolic language of the oblation ('figure of the body of Christ'), the elements are spoken of as 'the bread and the cup of eternal life.' This accords with the Western tradition and the language of Jerome and Augustine. But in these prayers the sacramental idea is subordinated to the literal one. In the reference to the elements as body and blood, we find a reference to the gifts of Abel and the sacrifices of Abraham and Melchizedek.

(d) The conception of the sacrifice in these sources combines the idea of the oblation of the gifts (cf. Didache and Irenæus) with that of the memorial of the Passion (cf. Justin and Cyprian). Thus we find mention made of 'this living sacrifice,' 'this bloodless oblation,' and a reference, before the invocation, to the 'bread scattered upon the mountains' (Serapion; cf. Didache) ; also a prayer for those who have offered the offerings and thanksgivings, after the invocation (Serapion). Similarly the Apostolic Constitution of the Franks makes no reference to consecration, while the Eucharist has a conversion of the elements into the body and blood of Christ, while their opponents adhere to the 'diplysiaste' view, and maintain that the elements retain their own nature, and that the 'change' effected by consecration is in the region of grace (σερα χάριν). Such is the argument of Theodoret (+ 457) (Eranistes, i. 59 (PG 33xxiii. 87), l. 185 f. (ib. 207)). The same argument re-appears in the Epistles of Eusebius [Eusebius] (cf. Didache, p. 332), and in the East the doctrine of the conversion of the elements became more and more the accepted teaching, until in the 8th cent. John of Damascus (+ after 750), whose work de Fide Orthodoxa has, so to speak, established the tradition, at this time, sets it forth as the established dogma of the Church. Like Gregory of Nyssa, he illustrates the change in the elements by the transformation of food in our rite. The gifts of Abel and the sacrifices of Abraham and Melchizedek may be quoted as 'types' of the offering of Christ.

Serapion accords with the fuller development of the sacrificial idea, as found in Cyril of Jerusalem, in the prayer after the consecration: 'We beseech Thee, through this sacrifice, be reconciled to all of us and be merciful' (Iudicis). Lastly, in Serapion and the Apostolic Constitution the emphasis is on the departed and others are offered after the consecration (cf. Cyril Jer. Cat. xxi. 9, quoted above). This development is significant, and helps to explain how the 'High Mass' of later times passed into the 'High Mass' of later times.

3. The Eucharist in the later Patristic period (5th-8th centuries).—The two main developments in Eucharistic teaching which have been traced above may be summarized as follows: (1) the transition from a distinction between the elements and that which they signify (the 'diplysiaste' view, Harnack, Batiffol) to the conception of the body and blood of Christ (the 'conversion' doctrine, Batiffol); (2) the transformation of the idea of sacrifice, according to which the conceiving of the offering of the gifts and the memorial of the Passion becomes an offering of the body and blood as a propitiatory memorial sacrifice. In the period which followed, these two tendencies were accentuated, though they had to encounter the influence of an earlier tradition and the authority of Augustine's teaching long restored the former.

(1) The parallel which Gregory of Nyssa had drawn between the Eucharist and the Incarnation, and the idea that the latter is continued, as to its effects, in the former, concentrated attention on the rite as a living witness and attestation of the practical power of the Church's faith with regard to the Person of Christ. Thus Gregory of Nyssa complains that Eunomius and his followers held the view that the sacrifice and the sacramental tokens and customs from which the Christian profession draws its vigour, and that he had maintained that the sacramental tokens do not, as we have believed, secure spiritual blessings and avert from believers the assaults directed against them by the wiles of the evil one (c. Eunom. bk. xi. (PG xlv. 880)). Similarly, Cyril of Alexandria, in his Third Letter to Nestorius, appeals to the Eucharist as teaching that the flesh of Christ is 'life-giving' (ζωοοδότης). Thus it witnesses against Nestorius' teaching, which maintains that the flesh of Christ is not the flesh of the Word. In the transition to the Eastern Church in the subsequent period we find the same appeal to the Eucharist made by the orthodox and the Monophysites alike in support of their doctrine. On the other hand, the Monophysites contend that in the Eucharist there is a conversion of the elements into the body and blood of Christ, while their opponents adhere to the 'diplysiaste' view, and maintain that the elements retain their own nature, and that the 'change' effected by consecration is in the region of grace (σερα χάριν). Such is the argument of Theodoret (+ 457) (Eranistes, i. 59 (PG 33xxiii. 87), l. 185 f. (ib. 207)). The same argument re-appears in the Epistles of Eusebius (cf. Didache, p. 332), and in the East the doctrine of the conversion of the elements became more and more the accepted teaching, until in the 8th cent. John of Damascus (+ after 750), whose work de Fide Orthodoxa has, so to speak, established the tradition, at this time, sets it forth as the established dogma of the Church. Like Gregory of Nyssa, he illustrates the change in the elements by the transformation of food in our rite. The gifts of Abel and the sacrifices of Abraham and Melchizedek may be quoted as 'types' of the offering of Christ.
further maintains the identity of the Eucharistic and the historical body of Christ (though even he shows lingering traces of the earlier view when he speaks of the bread as 'not mere bread, but bread united to the Divinity'). For his whole treatment, see G. E. M. de Guignes, p. 321.

In the West the influence of the teaching associated with the name of Ambrose (see above, § 2 (3)) must be reckoned as one of the main factors in introducing the doctrine of conversion. But into this whole question was woven the weighty authority of Augustine's teaching, which delayed for some centuries the complete acceptance in the West of the Ambrosian view. Augustine starts from the earlier Western teaching, and is in the same line of tradition as Tertullian and Cyprian. But his importance also consists in the fact that he attempted an analysis of the idea of sacraments, which was epoch-making, and became authoritative for Western Christendom in later times. Thus his definition of sacraments as 'visible signs of divine things,' in which 'the invisible things themselves are honoured' (De Cat. Rudi. xxvi. 50), his statement that 'the word is the outward sign, another is understood' (Serm. cxdxivii. 8), and that what is seen has a bodily appearance, what is understood has spiritual profit (ib. 9), as also his distinction between the outward part (or external part) and the inward part; cf. Tract. in John. xvi. 10) on the one hand, and between the 'sacrament' and the 'virtue' (virtus) of the sacrament (in Joan. ib. 11; En. in Ps. lxxvii. 2) on the other, became classical for the later period, and form the starting-point of medieval discussions upon the subject.

Of importance, too, is his statement that 'the word is added to the element, and a sacrament is constituted, being made visible' (De Cat. Rudi. xxvi. 50). But, in accordance with the emphasis which his teaching laid on the spiritual side of things, and the importance which he attached to 'faith' and 'the word,' his language at times seems to pass almost into a figurative or symbolic view of the sacraments, and he has been claimed as teaching such by theological controversialists, as well as by many modern scholars (e.g. Harnack and Loofs). Thus he speaks, like Tertullian, of Christ delivering to the disciples 'the figure' (figurant) or 'sign' (signum) of His body and blood (En. in Ps. iii. 1; c. Adiutant. xii. 3). The become the body of Christ, because it has been sanctified by the word of God, it is His body; and it is His body (in Joan. xxxv. 3). Augustine uses the words consecrato, benedicito, and sanctificare to denote this consecration, and this sanctification has the effect of making the elements 'a sacrament of commemoration of Christ's sacrifice' (c. Faust. xx. 21). The sign, however, must be carefully distinguished from that which it signifies: 'it is not that which is seen that feeds, but that which is believed' (Serm. exii. 5). 'Believe, and thou hast eaten' (credere et manducari [in Joan. xxvii. 12]). The 'eating of the body' and 'drinking of the blood' in Jn 6th are expounded by him as meaning 'to dwell in Christ and to have Christ dwelling in us' (Cath. Tract. xiv. 1). It is well that we could not partake, but of this flesh we receive that which was its essence, the Spirit which quickens it (in Joan. xxvii. 5). The presence of Christ is, in fact, a spiritual presence (Augustine, however, nowhere uses this phrase of the Eucharist). Augustine does not identify the Eucharistic body with the historical body of Christ, but sees to conceive of the spiritual essence of Christ's humanity as receiving a new symbolical body (non hoc corpus quod visibile manducaturi est... sacramentum aliqud visibilis commendavit), and this spiritual essence also becomes the spiritual essence of the Church, which is sometimes spoken of as the body of Christ, and as the res sacramenti (see Serm. cxxxvii. in Joan. xxvii. 15; Ep. clxxxvi. 3 (ed Botte) and De Enarrationibus, p. 232, note 1). The latter presentation is in accord with the earlier language of Tertullian and Cyprian (cf. Tert. de Orat. 6; Cyprian, Ep. lxxxvi. 15). Again, he thought to teach a 'receptionist' view of the Sacrament, and some of his language certainly accords with such an idea. But his treatment is unsatisfactory, and his teaching on the subject of the reception by the wicked is not consistent. In some passages he seems to identify the eating of the flesh of Christ with believing on Him (see above), and maintains that those who 'abide in Christ' alone are the body and blood (in Joan. xxvii. 18; de Civ. Dei. xxvi. 55), though elsewhere he teaches that the 'inward part' (or res) is given to all (see Serm. cxxxiv. 7 ['infants partake of His table, that they may have life in themselves']), and for the reception by the wicked he quotes Cyprian (De Donat. v. 9; Serm. lxxiii. 17; in Joan. xxvii. 11). On the whole, Augustine must be ranked with those Eastern and Western writers upon the Eucharist who, in attempting to explain what he taught, what has been called the 'dyophysis' view. The characteristic of this teaching is, as we have seen (above, § 2), the sharp distinction which it draws between the sign and the thing signified. But, though Augustine emphasizes this point so strongly, and at the same time urges the importance of faith and the spirituality of the gift, there is no real justification for regarding him as teaching a purely spiritual gift (in Joan. xxxv. 3). But, though Augustine emphasizes this point so strongly, and at the same time urges the importance of faith and the spirituality of the gift, there is no real justification for regarding him as teaching a purely spiritual gift (in Joan. xxxv. 3).

For a fuller discussion of Augustine's teaching, see Harnack, Hist. of Dogma, Eng. tr. v. 1551; Loofs, RF v. 61-63; Bartollet, Edutes, 2nd ser., p. 3281. The last-named criticizes Loofs' symbolic interpretation, and also objects to his appeal to Augustine as teaching explicitly a belief in an objective presence in the elements (e.g. En. in Ps. xxvii. 9; Serm. cxxvii. i. 10; cxxxiv. 25).

These two currents of thought, the Ambrosian and the Augustinian, are exhibited in the writers of the 6th century. The Africans, Fulgentius and Faucundus, and the Spaniards, Isidore of Seville, re-echo the language of Augustine, while Cæsarius of Arles and Pope Gregory the Great repeat the teaching of Ambrose (Loofs, loc. cit.). The same is true of the language of the prayers in the Western liturgies between the 6th and the 8th century. On the one hand, there are found such phrases as 'the bread changed into the flesh... the cup changed into the blood,' 'unto the transformation of the body of Christ,' 'the Lord God Jesus Christ,' 'to eat the body,' 'to drink the blood'; on the other hand, there occur 'spiritual food,' 'spiritual cup,' 'the virtue of the heavenly food,' 'the image of the sacrament.' In the early Middle Ages the language of these prayers, as well as the authority of Augustine and Ambrose, was appealed to in the controversies on the Eucharist (Battiloria, op. cit. p. 348 f.).

(2) The transformation of the conception of the sacrifice in the Eucharist during the 3rd and 4th centuries, which has been indicated above, affected the course of the developments during the following period. In the East there was little development beyond the standpoint of Cyril of Jerusalem...
and Chrysostom. John of Damascus has only a passing reference to the subject, in which he recalls the type of Melchizedek and the prophecy of Mal 1:10, and speaks of the "pure and unbloody sacrifice of Christ" (v. 11). In the West we find, as in the treatment of the nature of the gift, two traditions, represented by Augustine on the one hand, and Ambrose on the other.

Augustine's conception of the sacrifice exhibits two characteristics, both of which may be paralleled from the earlier language current in the West. (a) The Eucharist is a "commemoration of the sacrifice of the Cross" (sacerfactum memoriae, sacramentum memorii [c. Faust. xx. 18. 21]). The sacrifice of the Cross was prefigured by the OT sacrifices. It was offered in reality on the Cross. It is celebrated by a "sacrament of commemoration" in the Eucharist (ib. 21). This language may be paralleled from Cyprian (collocam in commemorationem Domini et passionis ejus [Ep. xiii. 17]), and from the prayers of the Roman Canon in the de Sacramentis (the institution is figura corporis et sanguinis). Again, he speaks of the Eucharist as "the sacrifice of the body and blood of Christ" (de Au. et de Orat. i. 11 [13]), of "offering the body of Christ" (ib. 9), and of "the sacrifice of our ransom" (Confess. ix. 12 [32]). This also recalls Cyprian (see above, II. 2 (5)). (b) But the most distinctive feature of Augustine's teaching is his emphasis on the union of the faithful in the Eucharist with the sacrifice of Christ. The faithful themselves, by partaking of Christ's body and blood, are the sacrifice, and become "the body of Christ" (Serm. cxxvii. de Civ. Dei, x. 6. 29 [xxii. 10]). This conception, which is a development of Pauline teaching (1 Co 10; 1 Co), had been anticipated by Tertullian (de Orat. 6), who connects with the gift of 'daily bread' the idea of contumine in Christ and inseparability from His body (i.e. the mystical body), and by Cyprian (Ep. xiii. 18), who finds in the mixture of water with wine in the chalice a representation of the incorporation of the people in Christ.

On the other hand, the teaching of Ambrose (see above, II. § 2 (5)) is probably Gregory the Great in the 6th century (Dial. iv. 58). (a) The Eucharist is related to the sacrifice of the Cross, which "renews" (revivit) though this language is qualified by the words "in a mystery" and by the comment that it "imitates the Passion of the Only-begotten Son" (cf. Ambrose, in imagine). (b) Like Ambrose and Chrysostom, Gregory connects the heavenly life of Christ. He who is "immolated for us again in the mystery of the holy oblation" is the Son who died no more, but lives in Himself immortally and incorruptibly. In the mystery of the Eucharist things earthly are united with things heavenly (ib.). The whole action is, in fact, as in Ambrose, mystical and transcendental. Moreover, Gregory combines with this theme two conceptions which further qualify his language, and relate it to that of Augustine. (a) The sacrifice of the Eucharist is closely associated with the communion of the faithful. (b) The sacrifice is consecration, "the consecration of the worshippers" (ib. 59, For then will He be truly the victim [hostias] for us to God. the soul, we have made ourselves a victim [hostias]).

He speaks of the Eucharist and Gregory the Great in their teaching upon the sacrifice in the Eucharist exhibit certain common features, which re-appear in later Greek teaching and in some of the early mystics in the West. In both the language there lies the Pauline conception of the mystical body of Christ. "Through Christ, the Head of the body, and in union with Him (hence the emphasis of Gregory and Chrysostom on the communion and self-oblation of the faithful) we are united to the Godhead". The same time these Fathers appear to recognize that the scriptural application (e.g. in Hebrews) of the language of sacrifice and priesthood to the heavenly body of Christ is but the language of illustration, used to express the living truth of the sacrifice in the person of Christ to the throne of God: "His Incarnation is itself the offering of our purification" (Greg. Mag. Moral. i. 34; cf. Ep. 76). He has made a distinction, and sets forth that truth 'in an image' or 'in a mystery' (Ambrose, Greg.). The whole action of the rite is 'the sacrifice' (Ambrose). The same idea is suggested by the early language of Romans on the 'heavenly altar,' and in the de Sacramentis and Eastern liturgy. See Gore, Body of Christ, p. 158.

(3) The conception of the propitiatory value of the sacrifice in the Eucharist, which has been traced in the earlier Patristic period (Origen, Cyril of Jerusalem), received a considerable emphasis later on. The metaphorical language used by some of the Fathers suggested a renewal of the sacrifice of Christ in the Eucharist (e.g. Ambrose, de Off. i. 48 [quasi recipientis passionem]).

Mag. Dial. iv. 58 [mortem unigeniti reperit, eterum immolatur] hom. in Ec. ii. 37; 7 [iterum patitur]), and, though qualified by other expressions, it came to be taken in a literal sense. The liturgical custom of offering in Mass the bread and wine, and the gradually to the idea that each offering constituted a distinct sacrifice for sin. The transition was slow and almost imperceptible. In popular re-interpretation the propitiatory conception doubtless received a considerable impetus from the influx of pagan ideas into the Church. The language of Gregory the Great shows in this respect the advance made upon the earlier period. He dwells much upon the benefits resulting from the offering of the sacrifice of the Mass for souls in purgatory; in his Dialogues (iv. 55) he tells how a priest is visited by the apparition of a departed soul, who offers to him bread, and says, 'Offer this bread to Almighty God on my behalf, that thou mayst intercede for my sins.'

The transition from the Eucharistic to the propitiatory view of the Eucharist is reflected in the Western Sacramentaries, when compared with the earlier prayers (e.g. the de Sacramentis). Thus in the Leonine Sacramentary (6th cent.), side by side with the older language, which speaks of 'the sacrifice of praise, we find 'sacrifice of propitiation and praise' (sacrificium placationis et lauda). We may compare also the following prayers from the same source: (a) 'O Lord, we beseech Thee, mercifully sanctify these gifts, and, receiving them in the Eucharist, we beseech Thee to make us to be an eternal gift unto Thee'; (b) 'O Lord, mercifully look upon these gifts which we bring for the souls of Thy saints, and offer for our offences' (ed. Felton, Cambridge, 1896, pp. 24, 19).

The Western Sacramentaries, in fact, exhibit, in the multitude of their variable prayers, the gradations between the earlier Eucharistic and the later propitiatory view.

III. THE Eucharist in the MIDDLE AGES (A.D. 600-1500).—The Eucharistic Rite. With the Middle Ages we enter upon a period of enthusiasm and controversy upon the Eucharist, which before
the time of Paschasius had never received really systematic treatment at the hands of theologians. From the 9th cent. onwards, however, it continued to occupy a prominent place in theological discussion, which gradually formulated a theory of sacrament in the form of a mode of operation, effects, and place in religion. The period from the 9th to the 15th cent. marks the growth of a system of belief and practice, against which the Reformation of the 16th cent. was a protest. The history, however, is limited mainly to the West, where there was much greater movement of thought and much less uniformity upon the subject than in the East. The Greek Church, as a whole, held by the teaching of John of Damascus, in spite of occasional movements in the direction of a closer accord with later Western teaching (as at the Council of Lyons in 1274, when Greeks and Latins met to discuss reunion, and a statement was drawn up in which *meros adinit occurs as an equivalent for *transubstantiation). In the Western Church, on the other hand, the history of the doctrine exhibits a line of development different from that of the East. The conversion theory, taught by Ambrose, and established under Greek influence, gradually asserted itself, and was carried to its final development in the doctrine of transubstantiation. The two chief advocates who contributed most to the teaching upon the Eucharist were Ambrose and Augustine. The teaching of the former was appealed to by those who tended to the view of a miraculous conversion of the elements into the body and blood of Christ. The teaching of Augustine formed the starting-point of those who distinguished sharply the sign from the thing signified, and who inclined to the view of a spiritual presence which is a view which passes in its more extreme forms into a receptionist or commemorative view of the rite. Generally, however, an attempt was made by both parties to harmonize the teaching of the two Fathers and to interpret them in accordance with their own standpoint. There are three reasons why the conversion doctrine finally prevailed during the Middle Ages. (1) It gave to simple minds an easy and literal interpretation of the words, "This is my body," "This is my blood." (2) It fell in with the realism of popular thought, which viewed everything in the concrete, whereas the more vague language of the Church has resisted this tendency. (3) The attempts to materialize it, and it was only by a *tour de force that medieval writers made Augustine speak the language of transubstantiation. The language of conversion lent itself to the growing love of the miraculous.

2. The Eucharistic controversies of the early Middle Ages.—The medieval history of the Eucharist begins with the controversy excited by the appearance of the treatise of Paschasius Radbertus, *On the Body and Blood of the Lord*, in 844. The author was a monk, and afterwards abbot, of Corbray. His book, which was the most complete treatise on the Eucharist that had yet appeared, dealt with the whole subject of the Sacrament, and was inspired by a profoundly religious spirit. Paschasius exhibits clear traces of Greek influence (Cyril of Alexandria, John of Damascus), and no less evidence of the Cappadocian influence (cf. Jn. 6th), which was apparently the inspiration of the young Neoplatonists. He is no metaphysician, but starts from a direct intuition of God, the need of faith, and the words of Christ, "This is my body." His treatment follows that of Ambrose in the main. He adds the miracles of the OT and the NT to the belief that the substance of the bread and wine is changed into the flesh and blood of Christ. Yet the change is an inward one, and is not apparent to sight or taste. If the elements retain their outward appearance, the object is to call forth faith and to remind believers that the gift is spiritual. He adds, however, that the Apollinarian type of reaction is not impossible. The change of the outward appearance has occurred to convince doubters or reward faith. Yet no portents can enhance the value of that which the faithful receive in the Sacrament. He maintains the identity of the Eucharistic and historical body of Christ, and explains its presence in countless places at once by a creative act of God on each occasion. Paschasius' treatise fell in with popular tendencies and became in the subsequent period the authoritative exposition of the rite. But the influence of Augustine was still too strong to allow such teaching to pass unchallenged. Outside the circle of Paschasius' admirers the language of Augustine was still repeated (Ambrose, Florus, Rabanus Maurus), while John Scotus Eriugena appears to have taught a purely symbolical view of the Sacrament. But the form in which Paschasius' book was written is a book called forth was Ratramnus (also a monk of Corbray), who, in response to a request of Charles the Bald, wrote his *treatise, On the Body and Blood of the Lord*. The two questions submitted to him were: (1) Is there in medieval church doctrine the idea of something under a veil, as when Christ speaks of Himself as the Bread or the Vine? The word *veritas* denotes the showing of a thing unveiled in its natural character, as when we say that Christ was born of a virgin. The element which Paschasius adds is that the body and blood of Christ remains veiled and is only one thing outwardly to the senses, and proclaims another inwardly to the minds of the faithful. There is no material miracle in the Eucharist. Outwardly the elements are the same as before. Inwardly, to the minds of the faithful, they are in a figure (*figurate*) Christ's body and blood. The change is a spiritual one. There are not two different substances, body and spirit, but one thing under two aspects—one bread and wine signifying one body in another the body and blood of Christ. In their bodily nature they are bread and wine; in power and spiritual efficacy they are the mysteries of the body and blood of Christ. *Veritas* represents the older conservative tradition of the West (Tertullian, Jerome, the de Sacramentis). He quotes from Augustine the phrase *figura corporis Christi*, to prove that the sacraments are one thing, the thing of which they are the sacramental sign is another. As visible creatures the elements feed the body; according to their invisible substance (i.e. the power of the Divine word) they feed and sanctify the soul. (2) In dealing with the second question, Ratramnus appeals to a distinction drawn by Ambrose (de Myst. 53) between the sacrament of the flesh and the verity of the same, and to a further statement of Ambrose in the Sacrament of the body, which represents the body of a Divine Spirit. It is called the body of Christ because in it the Spirit of Christ (i.e. the power of the Divine word) feeds and cleanses the faithful soul. Finally, he appeals to the Mass to show that the elements are the "pledge" and the "image" of the verity of Christ's body and blood, but not the verity itself, which will be manifested in open victory. Thus in his *de Sacramentis* Ratramnus moves the emphasis of the object exhibits in an acute form the ambiguity attaching generally to the older Western tradition as represented most conspicuously in Augustine, and it is difficult to decide whether Ratramnus believed that the gift bestowed in the Eucharist was merely a mysterious
operation of the Divine power through the elements, effecting union with Christ, or a presence in the elements of the body and blood of Christ. His teaching, however, had a certain currency in the subtexts. Much of it appears in the Homilies of the English Aelfric (10th cent.). Ratramnus' book, which came to be attributed to John Scotus Eriigena (see below), also attracted considerable attention at the time of the Berengarian controversy, particularly in the matter of the body and blood of Christ and the eucharist (per generationem subject). He further illustrates the use of the negative in Scripture and the Fathers, in order to prove that it is often employed not to deny the continued existence of that to which it refers, but to emphasize something which it has become, or some aspect of it to which attention is directed. Thus, when it is said that after consecration the elements are not bread and wine, but the body and blood of Christ, it is not necessarily implied that the bread and wine cease to exist (ib. p. 177 ff.). He attacks Paschasius' idea that the body and blood of Christ exist in the eucharist (cf. this), but that which he received in the eucharist is the general figurative view. Every sacrament implies a res sacramenti, seeing that it is, in Augustine's phrase, 'a visible sign or form of an invisible grace.' Lastly, he has a valuable statement of the nature of the Divine working in its use of natural means. Everything which is consecrated is of necessity enhanced, but by no means destroyed. To Berengar's opponents such teaching seemed to deny any real presence of Christ in the sacrament. A purely 'spiritual' presence, such as Berengar taught, seemed scarcely distinguishable from a presence only in the intelligence or memory (Hugh of Langres; cf. Gore, op. cit. p. 256). Hence Berengar's language seems to have been simply figurative view of the sacrament. Others charged him with teaching a theory of impanation, i.e., that, as Christ took human nature into personal union with Himself and became immanent in the sacrament He takes bread and wine into the same kind of union, and may be said to be immanent and inivinable (see below, § 4). Both these views are attributed to the followers of Berengar by writers of the 11th and 12th centuries (Witmund, Alger of Liége, Gregory of Bergamo). The controversy produced a series of replies to Berengar (Lanfranc, Hugh of Langres, Witmund of Aversa, Daniel of Troyes), which express the current conceptions (physical manducation, reception by the wicked, incorruptibility of the consecrated species). But Berengar's protest had not been in vain. From this period the earlier views tend to disappear. The rising Scholasticism of the 12th cent. took up the task of formulating the doctrine of conversion. The term transubstantiation was not apprehended by Hugh Witmund's phrase substantialiter transmutatur is a close approximation to it. In the task of formulating the Church's belief, however, the Schoolmen learned from the controversy with Berengar to lay aside many of the unacceptable conceptions which had been current before. 4. The Schoolmen and the doctrine of transub-
stantiation.—During the 12th cent., the development of the doctrine of the Eucharist was affected by two factors in the general history of the period. The first of these was the religious revival which had resulted from the reformation of the Papacy and the reaction to the Catharistic heresies of the 12th cent. in the Catholic mystics, St. Bernard and the Victorines (Hugh and Richard). And this revival brought with it a revival of the influence of St. Augustine’s teaching.

The spirituality of conception shown by writers upon the Eucharist during the period, and in the recoil from the materialism of the preceding century (cf. e.g. Hildebert of Tours, de Sacramentum Altarum: the presence of Christ is real, yet spiritual; Christ is in heaven, yet He is in the Sacrament; His presence is a presence of power and efficacy, yet it is in the elements). The language of St. Bernard (de Coena Domini) echoes the Augustinian distinction between the invisible grace and the visible sign, while Hugh of St. Victor speaks of the Eucharist as “an image of the invisible and spiritual participation of Jesus which is accomplished inwardly by faith and love” (de Sacr. Christ. Fid. ii. 8. 7).

A second influence was the intellectual revival, of which Berengar and Roscellin had been pioneers. They developed the scholasticism of Abelard, and the questions raised by the Eucharistic controversy were transferred to the region of metaphysics. Attempts were made to state the nature of the Eucharistic mystery in metaphysical terms. At the same time the whole idea of sacrament was revised, and in this task the influence of Augustine played an important part.

(1) The great problem of the period, which divided Nominalists and Realist philosophers, was the nature of the “universal” or “general idea.” This question had come to the front through Roscellin’s Nominalist teaching on the Trinity. In refuting him Anselm and Abélard, starting from the standpoint of realism, and with the help of Aristotle, discussed the relation of “universals” to corporeal existence. In this way the terms substantia and accidentia came to be used by them. They are first definitely applied to the Eucharist in the 12th cent., though Berengar had anticipated their use when he employed the distinction between substantia and accidentia. By substantia was denoted “the impalpable universal which was held to inhere in every particular thing, under another name,” and by accidentia the “sensible properties which came into existence when the pure Form clothed itself in Matter” (Rashdall, Universities of Europe in Med. Ages, London, 1895, i. 461). From the 12th cent. onwards the application of this metaphysical language to the Eucharistic mystery dominated Western teaching.

(2) A second result of Scholasticism was the revision of the whole conception of sacraments. This was mainly the work of Hugh of St. Victor (+1141) and Peter Lombard (+1164; his Sentences became the manual of the Schools in the Middle Ages). They start from Augustine’s definition of a sacrament as “a visible form of an invisible grace,” and distinguish between the sacramentum and the res sacramenti (Peter Lombard further distinguished in the Eucharist the res concreta et signa, i.e. the body and blood, and the res significta et non concreta, i.e. the unity of the Church). They maintain that the sacraments “contain” grace (Hugh of St. Victor) and are “causes” of grace (Peter Lombard). Their purpose is not only to signify, but to sanctify. These statements became the accepted definitions, and were completed in the 13th cent. by Thomas Aquinas, who taught that the sacraments effect that which they signify, though they are instrumental causes, the principal cause being God.

Both the developments which we have indicated as due to Scholasticism mark it in some ways a considerable gain. The metaphysical distinction of substantia and accidentia, as apprehended by the Schoolmen, made it possible to hold a more refined view of the Established Church’s declaration of the presence. For the substantia of the Schoolmen was in the final resort real only to thought, and could be apprehended only by the faith of the believer (popular though it was largely held a far different conception and elug to the cruder notions of the earlier period). Again, the distinction between the outward sign and the inward grace, when clearly defined and held, tended to minimize the dangers of materialism. From this time onwards the language of the Schoolmen shows a growing emphasis upon the spiritual character of the hidden substantia of the Sacrament, and an increasing tendency to give more reality to the accidents. Thus, in their discussions upon the Eucharist, Hugh of St. Victor and Peter Lombard reject the materialistic views which in the previous century had been associated with the fraction and reception of the Eucharist. Whether the consecrated elements (see Hugh, Sacr. Christ. Fid. ii. 8. 13; Peter Lombard, Sent. lib. iv. dist. 13). In dealing with such questions the mysticism of Hugh comes to his rescue. Thus he says (op. cit. i. 132), “Christ exhibits His bodily presence for a season in order to give us His spiritual presence. Just as in the Incarnation He withdrew His bodily presence at the Ascension, though His spiritual presence remained, so is it in the Sacrament. The Sacrament is completed. The virtue remains. Christ passes from the mouth to the heart. That food belongs to the soul, not to the body. If, then, after this you seek the bodily presence of Christ, seek it in heaven.”

Both Hugh of St. Victor and Peter Lombard start from the language of the 12th cent. of ‘universal’ or ‘general idea’. This question had come to the front through Roscellin’s Nominalist teaching on the Trinity. In refuting him Anselm and Abelard, starting from the standpoint of realism, and with the help of Aristotle, discussed the relation of ‘universals’ to corporeal existence. In this way the terms substantia and accidentia came to be used by them. They are first definitely applied to the Eucharist in the 12th cent., though Berengar had anticipated their use when he employed the distinction between substantia and accidentia. By substantia was denoted ‘the impalpable universal which was held to inhere in every particular thing, under another name,’ and by accidentia the ‘sensible properties which came into existence when the pure Form clothed itself in Matter’ (Rashdall, Universities of Europe in Med. Ages, London, 1895, i. 461). From the 12th cent. onwards the application of this metaphysical language to the Eucharistic mystery dominated Western teaching.

(2) A second result of Scholasticism was the revision of the whole conception of sacraments. This was mainly the work of Hugh of St. Victor (+1141) and Peter Lombard (+1164; his Sentences became the manual of the Schools in the Middle Ages). They start from Augustine’s definition of a sacrament as ‘a visible form of an invisible grace,’ and distinguish between the sacramentum and the res sacramenti (Peter Lombard further distinguished in the Eucharist the res concreta et signa, i.e. the body and blood, and the res significta et non concreta, i.e. the unity of the Church). They maintain that the sacraments ‘contain’ grace (Hugh of St. Victor) and are ‘causes’ of grace (Peter Lombard). Their purpose is not only to signify, but to sanctify. These statements became the accepted definitions, and were completed in the 13th cent. by Thomas Aquinas, who taught that the sacraments effect that which they signify, though they are instrumental causes, the principal cause being God.

Neither Hugh of St. Victor nor Peter Lombard employs the term transsubstantiation, which is used, however, by Hildebert of Tours early in the 12th cent., while the verb transsubstantiare is found in Stephen of Antun in the first half of the same century. But they clearly hold the teaching expressed by it, that during the consecration, the substantia of the bread and wine pass into the substantia of the body and blood of Christ, the sensible properties (or ‘accidents’) of the bread and wine being all that remains of the original elements.

The doctrine thus expressed became the formally recognized teaching of the West. It fell in with the accepted philosophy of the day, and it gave shape and consistency to the conception of popular thought. It secured the belief in a miraculous conversion which was demanded by popular religion, and it minimized the crude materialism of the earlier period. On the whole it seems to have met with little opposition after the middle of the century.
Rupert of Deutz (1135) represents the standpoint of earlier Patriotic teaching (Theodoreof, Gesa) in drawing a parallel between the Bread and Wine in Christ and the Holy and Divine elements in the Sacrament. Like Berengar, he denies that the working of the Divine Spirit destroys the substances which are assimilated. The transubstantiation taught by Christ was not changed or destroyed by the union. So, too, the bread and wine become the Body and Blood of Christ, not by being changed into the sensuous realities of flesh and blood, but by assuming invisibly the realities of the immortal substance, which is in fact (de Trinitate operius ejus: in Ec. il. 10). Card. Bellarmine charges Rupert with acting as a Pelagian (op. cit., § 1), which was also attributed to Berengar. But in both cases the use of the familiar Patriotic analogy lays no support to the view that Christ and the Holy Spirit are co-equal with the substance or substance of the Host and Wine.

In both cases, however, the motive which inspired the use of such language was opposition to the papacy, and to the conception of the conversion of the elements. But such language as that of Rupert is an isolated phenomenon among the Schoolmen, and does not anticipate the errors of the Albigenses. It deals with the doctrine of God, the authority of the Old Testament, the Incarnation, and the sacraments. The statement upon the Eucharist runs as follows: "The body and blood of Christ, being mixed outside the church, must needs be in the altar, although no one is in a state of salvation. In this Church, Jesus Christ Himself is both Priest and Sacrifice: He and His body and blood are really contained in the Sacrament of the altar under the species of bread and wine, the bread being transubstantiated into the Body, and the wine into the Blood by the power of God, so that, to effect the mystery of unity, we ourselves receive here what He Himself received from His Father."

The reserve exhibited in the language of this decree has given rise to the question whether the Council intended to impose upon the Church any dogmatical definition of transubstantiation. For, though the term transubstantiatur is employed, the accompanying language was opposition to the papacy, and to the conception of the conversion of the elements. There is no explicit statement to the effect that the substance of the elements cease to exist, and that the accidents alone remain.

Hence it has been maintained that transubstantiatur is used in a more general sense, to denote a mysterious change (cf. Palmer, Treatise on the Church of Christ, I, 1001.; Pusey, Real Presence, p. 141; Raittlo, Etudes, II, 303). The language of Pope Innocent III. in his treaty, On the Mystery of the Mass (vr. 7-9), has been adduced to show that he speaks without condemnation of the view that the elements of bread and wine continue in their integrity after consecration. But such a conclusion may be doubted, and the treatise appears to contain a most careful and explicit statement of the doctrine of transubstantiation. More to the point is the Decretal (op. cit., de Ia. 271.) to the language used in the 15th century. By Peter d'Ally, who is the same as the author of the previous paragraph, is used against this isolated expression of opinion other language which shows that the Medieval Church from Thomas Aquinas onwards regarded as heretical any notion beyond transubstantiation. So, too, the Council of Trent explains it, maintaining the change of the whole substance of the bread and wine into the body and blood of Christ, and denying the continuance of the substance of the bread and wine after consecration, though at the same time it speaks of the sacramental Presence as a "mode of existence which can scarcely be expressed in words." See, further, Stiern, History of the Doctrine of the Eucharist, I, 313.

Whatever ambiguity there is in the language of this decree, the scholastic doctrine of transubstantiation became the accepted teaching of the Western Church. It found its fullest expression in the teaching of St. Thomas Aquinas (I, q. xlvii.-xxxvi. 6). In two respects he advanced upon previous teaching. (a) He defined more exactly the nature of the Presence. (b) He dealt more fully with the question of the accidents. But Aquinas maintained that the whole Christ (totus Christus) is present, being entire in each species and every fragment of each species, the body being present in the bread, and the blood being present by concomitance in the species of the bread. (This had already been affirmed by some opponents of the Berongarians. In its origin the phrase totus Christus maintained the important truth that the gift of the whole Christ is received in the Sacrament, and guarded against the idea of a partimula carnis, a part of Christ. In this sense Aquinas denies that the presence of Christ is a local presence (localiter, in loco). He is present only per modum substantiae (so also, still earlier, Odo of Cambrai). Hence, in the Sacrament, he is present in all respects, but only per accidents, in relation to the movement of that in which He is. He denies any fraction of the body, and maintains, like Peter Lombard, that the wicked receive sacramentally, but not spiritually. Lastly, the body remains until the species are corrupted. On all these points he gathers up preceding discussions, and attempts to evade the materialistic conclusions of earlier writers, by defining and spiritualizing the conception of the Presence.

(b) In treating of the accidents, Aquinas, like the later Schoolmen generally, allows them greater reality than had been conceded in the earlier period. This was the way how to reconcile the teaching that the elements preserve many of the ordinary effects of a substance with a literal acceptance of the belief that they become Christ's body and blood. Aquinas maintains that the accidents exist without a subject, yet they retain the power of affecting objects and can breed life, nourish, be broken and corrupted. Yet, according to the Schoolmen, the accidents have no independent being, but simply characterize the substance in which they inhere. The solution which Aquinas offers is that they inhere in quantity (quantitas dimensae), as in a subject. This was the great problem of distinction among later Schoolmen, and under the stress of it the metaphysical theory of transubstantiation tended to break down. In the following period the Schoolmen are inclined to allow still greater reality to the accidents. Duns Scotus denies that they require a subject in which to inhere, while Wyclif ridiculed the prevailing uncertainty on the question (de Eucharistia, c. 6).

The controversies upon the Eucharist tended to intensify the devotion of the faithful to the Sacrament, which came to be regarded as the mystery of religion per excellence. Around the miracle of transubstantiation there gathered a wealth of legend intended to augment devotion to it in honour to the Sacrament. Corresponding to this sense of the miraculous character of the Sacrament, we find a growing decrease of communion. Attention came to be concentrated upon the act of consecration. Peter Lombard had affirmed that the form of the Sacrament is to be found in the words of institution, while Aquinas maintained that the Eucharist is completed in the consecration, whereas all other sacraments are completed in the application of the matter to the sanctification of the individual (Summa, III. lxxxi. 12, where, however, he maintains the necessity of the communion of the priest; see also both kinds). Worship and adoration formed the central feature of the rite. This in turn led to some important additions to the ceremonial of the Mass, the chief of them being the introduction of the ceremony of the elevation of the consecrated gifts. This ceremony must be distinguished from the earlier ceremony found in the Eastern liturgies and connected with the invitation to communion addressed to the faithful, "the holy things for them that are holy." There is no rubric in the Eastern rites prescribing the lifting of the consecrated gifts, though later on in the 17th century, under Roman influence, the Council of Jerusalem (1672) assigned to the Sacramental Presence the same dignity as that attached to the Trinity. In the West, some time during the 12th century, the practice of elevating the Hosts and Species of the Eucharist, and before the close of the canon, came into use. It was intended, doubtless, partly as a protest against the views of the Berongarians, partly as a show of respect for the mystery of Christ's presence. In earlier days the altar had...
EUCHARIST (to end of Middle Ages)

been veiled with curtains, but the object of this new ceremony was to make a spectacle of the central portion of the rite. Henceforward, the 'gasing upon' the Sacrament plays a prominent part in the liturgy, and the instruction upon the Mass (e.g. the Latin Missal, of the Mass Book). The canons of various English Councils in the 12th century referred to the custom of elevation for the purpose of adoration, and in the same century Durandus, bishop of Mende, and author of the Nationale Declaratorum Officiorum, shows acquaintance with the ceremony in a form resembling the present Roman rubric. For the rubric in the use of Sarum, see C. R. Dodgson, The Eucharist, Cambridge, 1897.

This devotion connected with the Eucharistic mystery culminated in the institution of the festival of Corpus Christi in 1264 by Pope Urban IV. (confirmed and established in 1311). The occasion called for the noble hymns of Thomas Aquinas, in which the Eucharistic devotion of the Mediæval Church found its loftiest expression.

The doctrine of transubstantiation in the later Middle Ages. — The doctrine of transubstantiation remained throughout the later Middle Ages the standard of faith for Western Christendom, and the attempts to challenge it met with little success. In some cases it was violently opposed, but nowhere with more severe censures. At the beginning of the 14th cent. John of Paris and Durandus of Pronzain declared that it was impossible to believe in the Real Presence without believing transubstantiation. William of Occam, the Nominalist Schoolman of the same century, suggested that on the grounds of reason alone, apart from the decision of the Church, the permanence of the substances of bread and wine was not improvable. But the greatest of all mediæval opponents of the doctrine was Wyclif. Inspired by the practical abuses of the day, he exposed the inconsistencies of the Scholastic teaching, and the idea of the accidents existing without a subject, and charging the popular devotion with idolatry. He is also reported to have taught that the unworthiness of the priest invalidates the Sacrament. Such a theory was undoubtedly held by some of his followers; but Wyclif himself, while holding that the disposition of the priest affected to some extent the value of the Mass celebrated by him, regarded the sanctity which the Sacrament has from Christ's presence as the same in all Eucharists (de Eucharistia, c. 4 [Wyclif Society, London, 1892]). Some of Wyclif's language looks like an assertion of a merely symbolical presence. He rejects transubstantiation, identifying it with assimulation, and maintains that the words of institution are used in a tropical sense (op. cit. 9, p. 291). He attacks the popular idea of a sensible, visible presence of Christ (op. cit. c. 1, p. 201.), and maintains that the body of Christ is 'virtually in the Host as in a sign' (op. cit. c. 8, p. 271). The Sacrament is the form of bread and wine, and not Christ or part of Him (ib. c. 1, p. 29). But this language was directed against the materialistic conceptions of his time. Wyclif's positive teaching seems to indicate a belief in a real, though sacramental, virtual, spiritual presence. The Host is not itself the body of Christ, but the very body of Christ hidden (ib. p. 15; cf. Post. Zisc, London, 1858, pp. 115, 117). The bread is an 'effectual figure' of the body of Christ, and the Sacrament has a special efficacy beyond that of other signs of the OT and NT (de Eucharistia, c. 8, p. 81).

The bread is an effectual figure of the body of Christ, and the Sacrament has a special efficacy beyond that of other signs of the OT and NT (de Eucharistia, c. 8, p. 81). Wyclif's positive teaching on this subject was less than that of other parts of his teaching. In Bohemia his teaching on transubstantiation did not gain many followers, and John Hus, while protesting against practical abuses connected with the Sacrament (e.g. the denial of the cup to the laity), appears to have accepted the doctrine of the Church in its main features.

The great movement in the direction of spiritual religion, originated by the German mystics during the 14th and 15th centuries, did not at first affect the Eucharistic doctrine of the Church. Though some of the mystics, like Eckhardt, were accused of speculative errors in the direction of pantheism, they adopted the most part the semi-spiritual position, which is not indifferent to sacraments, but seeks to interpret them in a way which brings out their spiritual value, as emphasizing the union of the soul with Christ and its devotion to Him (so Huygens, the author of the 'Consolation of the Chrisi'). In John Wessel († 1489), however, there is a tendency to break loose from current teaching. Luther regarded Wessel as a precursor of his own teaching in several respects. While emphasizing, with earlier mystics, the spiritual character of the participation of the body of Christ, Wessel held that this spiritual presence was not restricted to particular moments, but extended over the whole life of the believer, and that there is no essential difference between spiritual and sacramental participation. The latter had value only in so far as it rested upon the former. As a sacrament, the Lord's Supper is the Eucharist of the Church. As a spiritual act of participation in Christ by faith, it is possible for all without a priest (de Sacr. Euch., passim).

Still earlier than the Mystics, the wide-spread sects of the 12th and 13th centuries promoted a spirit of revolt from the established doctrines. Some, like the Waldenses, appealed to Scripture alone. Others, like the Albigenses, were affected by Manichean views. From the Franciscans in the 13th cent. there proceeded a famous book, The Eternal Gospel (the work of a disciple of the Abbot Joachim of Floris), which preached the near advent of a purely mystical religion, in which the Church system, with its priesthood and sacraments, should find no place.

6. The Eucharistic sacrifice in the earlier Middle Ages. — In the Eastern Church there was little development in the doctrine of the Eucharistic sacrifice beyond the conceptions of the earlier Patriarchal period, as exhibited in Cyril of Jerusalem and Chrysostom, and in the West by Ambrose and Gregory the Great. The commemorative character of the rite as a memorial of Christ's sacrifice, and its relation to the sacrifice of the Cross on the one hand, and to the heavenly life of Christ on the other, were clearly affirmed. Later on in the Middle Ages, especially in the 11th and 12th centuries, there was an effort to connect the Eucharistic sacrifice with the ascension of the Lord, and the sacrifice of the Mass was regarded as a memorial of the ascension, and the mysteries of the church, the body of Christ. The whole Eucharistic action on earth is, in fact, conceived of as a mystical representation in time of the 'eternal redemption' won for man by Christ. It procures the remission of sin, and the sanctification of the believer, and it is celebrated by the Church in the name of the Lord for the living and the dead, and by communion benefits the faithful (Cabasillas). Lastly, like the mystical commentators of the West, Cabasillas sees in the Eucharistic sacrifice itself a drama of the life, death, and resurrection of Christ. See, further, D. Stone, op. cit. i. 150 ff.

The teaching of the West in the 19th and following centuries exhibits some of the main characteristics of Patriarchal teaching.
(1) The Eucharist is regarded as a commemoration and representation of the Passion. But this representation is found in the Mass rather than in its wider purposes. The prayers of the Mass are a tableau of the life and death of Christ (Amalarius). The mixture of the chalice represents the chalice of the blood which flowed from the side of Christ (Paschasius). Others find this representation in those acts of the priest which are based upon what Christ did at the Supper (e.g. the Supper of the Lord (William of Thury, 12th cent.), or the double consecration of bread and wine (Peter Lombard, Alexander Hales). On the influence of these ideas on later conceptions of the sacrifice of the Mass, see below, §7.

(2) Emphasis is laid upon the effects of the sacrifice. The sacrifice is, in fact, explained, by and identified with, the effects which it produces upon the celebrant (cf. Augustine). The Paschasius (op. cit. c. 9) teaches that the consecration of the gifts renews the Passion, because Christ reiterates daily that which He did upon the Cross, offering himself to the Father to deliver us from our sins. The whole offering is due to our need of daily cleansing. By communion we partake of the fruits of Christ's death. Lastly, he repeats Augustine's saying that by participation we become Christ's body and blood. In other words, the same identification of the sacrifice with its effects appears in Alger of Liège (12th cent.; see de Sacram. Corp. et Sang. Dom. ii. 21.).

(3) Paschasius and Alger of Liège connect the Eucharistic offering with the heavenly intercession of Christ. According to Paschasius, the true priest in every Eucharist is Christ Himself, now made a priest for ever. It is He who offers the gifts presented on the earthly altar, and it is from His offering of Himself that we receive them back as His body and blood. Thus he explains the prayer in the Roman Canon, Jube hanc perferr. The lifting up of the gifts is their consecration. The whole act of offering is sacramental, mystical, supra-local. The altar on high, at which the gifts are offered, is the body of Christ, through which and in which He offers to the Father the prayers of the faithful and the faithful themselves (op. cit. 8, 12; cf. Alger of Liège, op. cit. i. 14). This view combines the earlier Western view of the Eucharistic offering, contained in the Roman Canon, with the Eastern view of the Mass, and found also in Ambrose and Gregory the Great among the Western Fathers. The Eucharist is no repetition of the sacrifice of the Cross. It is offered, as Paschasius says, in commemoration of the Passion (op. cit. c. 9: this expression qualifies the words 'passionem illius reparsam' in the same chapter). But that which connects it with the sacrifice of the Cross is the heavenly priesthood of Christ, who has passed through death and is ever present with the Father, and presents to Him our prayers and intercessions. (Note the identification of the altar on high with the body of Christ. This shows the practical identity of Paschasius' teaching with that of Ambrose and Gregory the Great. See above, II. 3 (2.).)

7. The Eucharistic sacrifice in the Scholastic period.—The early Schoolmen paid little attention to discussions of the doctrine of the Eucharist, their thoughts being occupied with discussions as to the mode of the presence of Christ in the Sacrament. They content themselves mainly with denying that there is an identity of the sacrifice of the Cross and with the simple statement (following Augustine) that there is a representation, or commemoration, or likeness of the sacrifice of the Cross in the Mass. Thus Robert of Deutz declares that the whole Christ is present upon the altar, 'not that he may again suffer, but that to faith, to which all past things are present, His Passion may be united by its presence in the Mass as in Gen. vi.'). Similar language is used by Peter Lombard (Sent. iv. 12, 7).

The Schoolmen of the 13th cent. attempt a more analytical treatment of the question of the sacrifice. They are influenced by the development of the notion of the juridical and moral rationale of sacrifice. William of Auvergne, Bishop of Paris (+1249), discusses the chief elements of the sacrifice. (a) Sacrifice is an act of homage to God with a view to the sanctification of the individual. (b) It is, in the theory of the sacrificial mass, a means of communion with God, and a source of spiritual refreshment. (c) It is an act by which the worshipper is associated with the family of God (de Legibus, c. 24). In what follows he maintains that the first and chief sacrifice is that of ourselves, without the offering of which nothing that we present to God is pleasing or acceptable to Him. The essence of the sacrifice of Christ lay in His sinless life of virtue (ib. c. 28). By his one oblation on the Cross, Christ has reconciled and sanctified the world. The sacrifice of the Mass is the application by the will of Christ of the benefits which accrue daily to the faithful from the sacrifice of the Cross. The sacrifice of the Eucharist propitiates God and averts His wrath. As a sacrament it sanctifies and supplies spiritual refreshment to those who receive it. Without the sacrifice of Christ and the Mass faith and devotion would die, and the faithful would be deprived of spiritual food. In it Christ is present as priest and victim, as advocate and healer (see the treatise de Sacramento Eucharistie, cc. 2, 3, 4). Similarly Albert the Great (+1280), the master of Thomas Aquinas, while combining in an original way the conceptions of earlier writers, and emphasizing the sanctifying effects of the sacrifice of the Cross which are imparted in the Eucharist, regards the Mass as an act of homage to God, and as representing the union of the Church with the self-oblation of Christ (de Sacram. Euch. dist. v. 4; Sent. iv. 13, 23). At the same time he prepared the way for future developments by discussing the question in what sense the Mass is distinct from the offering of the Cross (Sent. iv. 13, 23). See Vacant, Hist. de la conception du sacre du corps de notre Seigneur dans l'eglise latine, Paris, 1894, p. 39 f.

Nothing shows more clearly the undeveloped character of the doctrine of the Eucharistic sacrifice in the middle ages than the treatment which it receives in the Summa Theologiae of Thomas Aquinas. Like earlier Schoolmen, he emphasizes the effects of the sacrifice, and maintains that it is a 'representative image' of the Passion (III. lxxxiii. 1). Elsewhere he discusses the nature of sacrifice. It has its roots in the Laws of Nature. 'A sacrifice is something done for the honour properly due to God, to appease Him' (III. xvii. 5). But, he goes on, beyond previous Schoolmen in his further definition that sacrifice involves the production of a change in the object offered, 'as that animals were killed and burnt, that bread is broken and eaten, and likewise his flesh' (IV. 1 Pr. lixxv. 3 ad 3). The result of this definition was that the sacrifice was treated independently of the effects which it produced. This opened up a new era. In the later period the main question was, 'What is the doctrine of sacrifice, their thoughts being occupied with discussions as to the mode of the presence of Christ in the Sacrament. They content themselves mainly with denying that there is an identity of the sacrifice of the Cross and with the simple statement (following Augustine) that there is a representation, or commemoration, or likeness of the sacrifice of the Cross in the Mass. Thus Robert of Deutz declares that the whole Christ is present upon the altar, 'not that he may again suffer, but that to faith, to which all past things are present, His Passion may be united by its presence in the Mass as in Gen. vi.'). EUCHARIST (to end of Middle Ages)

In other respects the teaching of Aquinas associated the sacrifice of the Mass more closely with the consecration, and threw into greater prominence the character of the priest in the rite. In justifying communion in one kind, he argues that it is sufficient for the priest to receive in both kinds, because he receives in the person of all, and because 'the perfection of the sacrifice consists not in the use of the faithful but in the consecration of the matter' (III. lxxx. 12). This dictum, by isolating the act of the priest, encouraged the separation of the ideas of sacrifice and communion, which had already taken place in practice, and increased the tendency to view the Mass as an opus operatum completed in the act of consecration.

In connexion with the question of the relation of the priest's action in the Mass to that of Christ, the disciples of Aquinas followed their master in maintaining the idea of the Mass as a sacrifice, and the sacrifice of Christ, through the instrumentality of the priest. Duns Scotus (14th cent.), however, departs from this position in two respects. (a) He shows a greater anxiety to defend the unique character of the sacrifice of the Cross, and maintains that the sacrifice of the Mass has not the same value as the Passion of Christ, and that in it Christ does not offer immediately by an act of His own will, though He is present in the sacrifice (he quotes in support He 9:28). Still the Mass has a special worth, as being a special commemoration of the oblation of Christ upon the Cross, and as beseeching God for it (Quaest. Quaest. lib. 20, verr. 10). (2) He emphasizes the fact that the Eucharist is the act of the Church, rather than of the individual priest, and that it is accepted not by reason of the will of Christ acting immediately, but by the will of the Church (ibid.). This teaching was developed by the later Scotists (e.g. H一个是us and Biel).

In this later teaching upon the Eucharist the thought of the connexion between the worship of the Church and the heavenly intercession of the Mediator was back-ground of the early Christian conceptions of life and worship (cf. e.g. Clement of Alexandria, ad Cor. 36, 'the great priest of Christings'; see also Origen, de Ort. 10), and which characterizes the teaching of the later Greek Fathers, and in the West appears in Ambrose, Gregory the Great, and the early medieval writers, because obscure or even lost. Logically the later Scholastic teaching involved consequences which affected the value not only of the sacrifice of the Mass, but of the priesthood as well. Hence Vacant (op. cit. p. 49) says that it 'prepared the way for Protestantism' (cf. Kidd, op. cit. p. 104 f.).

(d) A second development of later medieval teaching was the idea that, while the sacrifice of the Cross availed for original sin, that of the Mass was an offering for daily sins both deadly and venial. This opinion was first mentioned and confirmed at the Council of Constance in 1538 (cf. the English Pr. Bk. art. xxxi.). The Roman theologians at first denied that such an opinion had been held. In reply the Reformers appealed to Aquinas. But the sermon appealed to, though ascribed to Thomas Aquinas, and also included in another form among the works of Albert the Great, undoubtedly belong to a later period. The same opinion was attributed to the Dominican Calendar, who was present at the Council of Trent, and it apparently gained a certain currency, largely because of its association with the two famous Schoolmen mentioned above. It was denounced by Latimer in 1540, when brought to light in the 16th cent., it was repudiated by the Roman theologians (for the history, see Vacant, op. cit. p. 41, note; Kidd, p. 73 f.).

9. The place of the Eucharist in medieval religion.—The historical development which has been traced above represents the growth of a doctrinal and practical system in which the influence of popular religion played a large part.

In the attempt to formulate a scientific statement of the mode of Christ's presence in the Eucharist the Schoolmen were hampered by the existence of an established belief which had taken shape in the later Patriotic and early medieval period, and which exhibited all the features of
crude and unreflective piety. They undoubtedly made a sincere attempt to free the doctrine from the materialistic expression which had been given to it before their time, but their influence in this respect, however, was in practice nil, for the expositions may have been, only very partially succeeded in affecting the general belief. The crude materialism of popular belief continually re-asserted itself (see, e.g., the statement of Archbishop Arundel in 1413, quoted by Stone, op. cit., p. 376 f.). Again, the absorption of the Schoolmen in the question of the mode of the Eucharistic presence only served the purpose of keeping the discussion on a lower plane, in which it was continually encumbered by the intrusion of purely physical questions, which withdrew attention from the purpose and significance of the Sacrament as a whole. We must except, however, from this criticism the treatment of the subject by such writers as William of Auvergne (see above, § 7).

(2) One effect of this excessive attention given to the question of the relation of the elements to the spiritual gift bestowed in the Sacrament was to concentrate the thought upon the moment of consecration, when by the miracle of transubstantiation the body and blood of Christ were present upon the altar. The elevation of the Sacrament upon the altar for the purpose above stated, § 4 gave point and precision to this aspect of the rite. Thus the Lay Folks’ Mass Book, which provides no devotions for communion, directs the worshipper after the consecration to do reverence to Jesus Christ’s own presence and to kneel, holding up both hands, and so to behold the elevation and meditate on Christ’s Passion. The manifestation of Christ in the Mass was regarded as supplying the greatest incentive to faith and devotion (see the language of William of Auvergne quoted above, § 7), and there is little doubt that in its higher forms this belief fostered a noble and beautiful piety (see, e.g., The Lay Folks’ Mass Book and the Ancren Riolte). But on its lower side this ‘gazing on’ the Sacrament tended to divert attention from the purpose of the Sacrament as a whole, and ministered to the craving for the miraculous and to a magical conception of religion.

(3) Corresponding to this emphasis on the moment of consecration we find a decline in frequency of communion. Amalarius in the 9th cent. still counselled the laity to fast on Fast-Friday (Langland, Pieters Plowman, Pass. xii. B. 358 1 f.) or even yearly communion (Chaucer, Parson’s Tale) was regarded as sufficient. The Fourth Lateran Council (1215), by prescribing a minimum of one communion a year, had contributed unintentionally to this growing infrequency, though local Councils from time to time sought to secure a higher standard. Among lay people frequent communion was exceptional (e.g., their mentions as a mark of exceptional piety that the Lady Margaret was ‘houselled’ well-nigh twelve times a year). Moreover, the custom had sprung up of giving communion outside the time of Mass (see Langland, Pieters Plowman, Pass. xxi. 4: ‘and dyhte me derly . . . and dide me to churche. To huyre holliche ye masse and be houseld after’). This dislocation of the rite, by severing the idea of communion from it, marks a wrenching departure in the liturgical order.

(4) Another medieval departure was the withdrawal of the cup from the laity. This practice began in the 12th cent., and was justified in the 13th by Aquinas on a comparison to the Lord’s Supper (Lancrenl, Dogmen-der, ii. 281; J. B. Franzelin, Tractatus de S.S. Euch. Sacram. et Sacrif., Boone, 1898; W. Palmer, A Treatise on the Church of Christ, London, 1855, ii. 161; E. P. Slicher, The Doctrine of the Real Presence as contained in the Fathers, Oxford, 1870, p. 177; P. Bailloud, La liturgie de l’eucharistie sacrifie, London, 1898; J. H. Shawley, Contribution de l’offrande du ver a la liturgie du XVe s., Freiburg, 1891), but as an actual fact, the rite was continued in the Church of England: de vererber de h. hostis ; de godsoordelen, Leyden, 1897.

(5) The Schoolmen, as we have seen, devoted comparatively little attention to the sacrificial aspect of the Eucharist, though some writers of the 13th cent. have valuable discussions on the rationale of sacrifice in general (e.g., William of Auvergne and Albert the Great). Here again they were hampered by the external and mechanical conception which had been growing up since the time of Pope Gregory the Great. This popular system had encouraged, by the frequency of Masses, an external and mechanical conception which tended to the belief that each Mass had a distinct propitiatory value apart from the moral condition of the worshipper. The result was that an exaggerated importance came to be attached to the mere hearing of Mass.

(6) Lastly, the loss of the corporate aspect of the Eucharist as an expression of the unity of the faithful, which finds a place in the teaching of St. Paul and St. Augustine, was another consequence of the severance of the idea of communion from that of worship. The Schoolmen, indeed, in their treatises frequently refer to this aspect of the matter, and quote Augustine’s language upon the subject, but in popular religion and practice it seems to have found little place.

On the other hand, the mediaval doctrine and practice with regard to the Eucharist rendered important services to religion by the impressive witness which the mass had to the doctrine of the rite. (a) Worship and adoration found a striking and noble expression in the mediaval Mass, and in the prayers contained in some of the popular books of instruction. To the men of the Middle Ages the Mass was the mystery par excellence of the Church. Around it there gathered all the splendour which art and music could provide. The appeal that was made to eye and ear in the public worship of the Church was externalised in the sanctification and subdue the will. And there is little doubt that to multitudes the Mass provided a real incentive to devotion and to spiritual worship. (b) The mediavil Mass kept the memory of the Passion of Christ vividly before the minds of the worshippers. The popular books of devotion and the mystical commentators on the Mass alike emphasize the conception of the Mass as a sacred drama exhibiting and reenacting again and again the story of the Lord’s Passion ‘until He come.’ (c) The mystical aspect of the Eucharist as a means by which the union of the soul with Christ is effected finds clear expression in the mediaval Mass. The Mass alike in the teaching of St. Bernard, Hugh of St. Victor, William of Auvergne, in the hymns of Thomas Aquinas, and the devotions of the Imitatio Christi.

J. H. SHAWLEY.
BUCHARIST (Reformation and post-Reformation period)

EUCHARIST (Reformation and post-Reformation period)—1. GENERAL.—The first Reformation utterance concerning the nature of the Eucharist is found in Luther's sermon of 1518, *De digna praparatimone cordis pro suscipiendo Sacramentum Eucharisticum*. In order to avoid any unnecessary repetition, the believer must free his mind of all hatred and dissension. No other sins are so incompatible with both the name and the *res* of this sacrament, for its name is communion, and the *res* of the Eucharist is the body and blood of Christ. A picture of this, for the one bread is made up of many grains and the wine of many grapes.

Nouns are communi communi unum. Quod et figuratur in speciebus sacramento, in quibus multa granum, multae singulorum differentia, in unum panem. Item unae multae, amnis aus quoque differentia, in unum nummus redactae sunt.

It has often been remarked that, instead of union, this sacrament brought division into the ranks of the Reformers; in place of the *unitas cordium* there is a bitter sacramental controversy. But, while this is true, it ought not to blind us to the underlying unity of the Protestant doctrine. The Reformed Churches in all its various branches, is united in rejecting certain points of medieval theory and practice. Chief among these are: (1) the doctrine of Transubstantiation; (2) the idea of the *unam)* of the Host; (4) the *sacramentum propitiatorium* of the Mass; (5) the denial of the cup to the laity. If not so united on the positive side, it has been, and is, practically unanimous in making the following assertions: (1) that the Eucharist—whatever name for it may be in common use—is a sacrament instituted by Christ.

Here the Quakers dissent. They reject the idea of sacraments altogether. The Spirit of God is the only signatory and pledge of our Gospel inheritance. *'The communion of the body and blood of Christ is a mere symbolic and spiritual thing, breaking the bread of Christ and His disciples was a figure, which even they who have received the substance used in the church for a time, for the sake of the weak . . . yet seeing they are but shadows of better things, they cease in such as have obtained the inheritance* (Barclay, *Apology*, Prop. 13).

(2) That it is the central act of Christian worship.

(3) That it is a means of grace.

At this point a not inconceivable number part company with the general Protestant doctrine. Historically, they are represented by the Socinians. To them the Lord's Supper is not directly a means of grace. In their Confessional doxologies, they were even bold to speak of sacraments. They called the Eucharist the Lord's Supper *soma christi sacramento christi* (Christ's body as Christ's sacrament) which it was becoming to retain as a venerable and beautiful custom. It was instituted that believers might call to mind with thankfulness the work of the Cross and the things which this breaking of bread by Christ and His disciples was a figure, which even they who have received the substance used in the church for a time, for the sake of the weak . . . yet seeing they are but shadows of better things, they cease in such as have obtained the inheritance (Barclay, *Apology*, Prop. 13).

(2) That it is the central act of Christian worship.

(3) That it is a means of grace.
The explanation of the sacramental unity, the co-existence of body and bread, he found in the metaphysics of Scholasticism.

His theory of the mode of presence of Christ's body goes back to certain distinctions made by William of Occam and adopted by H. J. and d'Anvers against a thesis first in his sermon Forma Sacrament demonstrationes (1526), and is developed in his other controversial writings against the Swiss reformers. Occam had taught (1) the esse repletivum (omnipresence) of God, (2) the unipresentsia of the body of Christ in heaven, and (3) the presence of the body of Christ in the Eucharist. The difficulty here lies in the esse differentiae. It is explained by Luther as that which is in space but does not fill any portion of it, and is not circumscribed by it. To Christ's resurrection-body belonged this kind of presence. 'Just as the sealed stone and the shut door remained unaltered, and yet His body was at the place where were mere stone and wood, in the same way is His in the Sacrament where the bread and wine are, and the bread and wine remain untransformed and unaltered' (Spec. de. x. 2841). The sacramento were not the mere symbols of the real presence, conceived in our local or circumscripted fashion. His body is present not after the mode of the esse circumscriptivum, but after that of the esse repletivum, not after the fact of the esse differentia. Luther holds that Christ's body is not broken, but remains complete in every part, even in the bread and wine. Scholasticism's repletion would have rested finally on the esse differentiae of Occam, had it not been that he was continually faced with the question, 'Christ is seated at the right hand of God, where is His body be in the Sacrament?' This he met by denying that the right hand of God is local. It is not a particular place 'like a golden chair, or the like.' God's right hand is everywhere. So he turns round to his opponents with this argument: 'Christ's body is at the right hand of God—that is omnipresent. But the right hand of God is everywhere—so assuredly it is in the bread!' (Weimar ed. vii. 149; cf. Hunzinger, PRF. xx. 186). The esse differentiae has thus been exalted to the esse repletivum, the multivoldispersitas to omnipresence.

To the same conclusion Luther came also from the side of Christology, in which he taught that the conjunction of the two natures in Christ implies a communicatio idiomatum—a transference of the attributes of the one to the other—and that, therefore, the body of Christ possessed the Divine attribute of omnipresence.

But all this proved too much, as his opponents were not slow in pointing out. If the body of Christ was everywhere, then it was received in every common meal, and not only in the Eucharist.

This difficulty was met by saying that there was a real presence in accordance with the promise. It is one thing for Christ to be present, and another thing for Him to be present for us. He is there for thee, when He says 'Himself by His word, and says,' 'Here art thou to find me.' (ib. xxii. 151). The solution is imperfect, as, indeed, must any attempt be to connect a theory of the ubiquity of Christ's body with a real presence in the Sacrament. For either (1) there is the mere presence everywhere as in the Sacrament, or (2) a specific sacramental presence must be added to the other, and is so far distinct from the other. Luther himself did not consider his theorizing to be binding or final. He had outlined an intelligible way in which the almighty power of God could secure the presence of the body and blood. What he did not do was to decide the formal fact of the real presence in, with, and under the bread and wine.

The characteristic Lutheran in, om, et sub panis is not Luther's own. It appears in the writings of Melanchthon and Krebs in Heidelberg after his death. Luther himself spoke of et sub panis, without the et, as far as we know.

In whatever way it might be explained, Luther's strong religious interest made him insist on the
real presence being conserved. Sometimes his vehemence led him into language which went beyond the instructions to Melanchthon in 1534; he uses language which might seem to imply that the body of Christ in the Eucharist is eaten after the manner of ordinary food:

"In brief this is our doctrine, that the body of Christ is truly eaten in and with the bread, so that what the bread does and suffers, the body of Christ does and suffers; it is distributed on our part, and our part is partaken with the bread."

But the qualifying phrase and the heat of controversy ought to keep us from pressing these words too far. And the Formula of Concord (Epitome, Art. 7, neg. 21) expressly rules out any such interpretation.

We also utterly reject and condemn the Capernalian manducatio of the body of Christ, as if, forswear, we taught that the body of Christ is torn by the teeth (with dein seriem). Luther regarded the manducatio ipiiorum as a decisive test of any supposed doctrine of the real presence. It was, in fact, that Luther, if the body of Christ were really present, in the sense that he understood the word, even the unbelieving who partook of the bread participated also in the body of Christ. This manducatio ipiiorum was so much an essential part of his doctrine that he used it from the beginning as an argument to overwhelm Carlstadt. The evangelical nature of the Sacrament he preserved by asserting that, though the unbeliever participated in the body and blood, they had no part in the grace of which body and blood were vehicles.

The main thoughts in Luther's reconstruction are these: (1) that the Eucharist was instituted for the commemoration of the events of Christ's passion; (2) that the true and complete meaning of the Eucharist consists in the reaffirmation of the assurance of the grace of God and communion with the Risen Lord; (3) that the objective guarantee of this assurance and the means of this communion is the real presence of the body and blood of Christ, in (with) and under the elements of bread and wine; (3) that the real presence itself is assured by the ubiquity of Christ's body, and made available by the words of institution; (4) that this real presence entails that the unbelieving participate in the body and blood of Christ, though they have no part in the grace of the Sacrament.

The doctrine of Zwingli—As already mentioned, the difference between Zwingli and Luther largely arose from the different points of departure—the Mass and the Eucharist respectively. To this must be added differences in training and religious experience. Luther's education was monastic, his theological studies originally and essentially Scholastic. Zwingli's education was Humanist, his theological studies originally Patristic. Luther's first Eucharistic controversy was with over-zealous Reformers, Zwingli's with upholders of the Mass. Luther's general idea of a sacrament received its evangelical shape in conflict with Rome over Indulgences and the sacrament of Penance, Zwingli's in controversy with the Anabaptists over Baptism. Against magical ideas of sacramental grace, Luther was led, therefore, to emphasize personal understanding and belief; against individualistic notions, Zwingli brought to prominence the social side of Christianity, the relation of the sacraments to the community.

In Zwingli's Von Tost und Widertost (1522), Baptism is a sign of election, but the Eucharist is primarily a memorial sacrifice. The expression he probably obtained from Melanchthon, who in his Letter (1521) had spoken of the sacraments as 'tesserae militae.' The Eucharist was the symbol of the communion of all believers in Christ. * Ergo hunc pacem editum, ut una pacis eorum commoditate, fit universae ecclesiae concordia in hoc, ut in actu cohaerendo in Christo sanctitate, in bene usu, in se sit, in aequitatis ordine, inter se et pacis eorum commoditate. * (1523) This is a historical reconstruction. It was Zwingli's main contention that the believer in the covenant of grace, and placed in the body of Christ in accordance with his profession. So, while Luther almost always thought of the individual in the communion, Zwingli gave prominence to the significance of the Supper for the Church community, and this especially when in conflict with Luther on the Eucharist. Zwingli's teaching is divided into three distinct periods. In the earliest and latest periods the main teaching is to be found in the middle period, during the controversy with Luther, the one essential point of his teaching at other times is obscured and even denied. In this article the former is taken to be the true Zwinglian doctrine.

Zwingli set out against the sacrificial aspect of medieval doctrine. Over against it he erected another, with its thought of the repetition of the Sacrifice of the Cross, he set the Supper as a memorial or remembrance, of the Sacrifice offered once for all. The thought of remembrance, therefore, is not supposed to any thought of present participation, but opposed simply to any thought of repetition. The bread and wine were signs of the broken body and the shed blood. The primary reference of the Eucharist, therefore, was to the death of Christ, and not to any union with the glorified Christ.

From the beginning of his teaching, Zwingli felt that the words *Hoc est corpus meum* must be understood in some figurative manner. 'But in 1522 he came to know of Gerhard Heyn's (Honius) *Vindicatio Christiana,*' and the body of Christ were really present, in the sense that he understood the word, even the unbelieving who partook of the bread participated also in the body of Christ. This manducatio ipiiorum was so much a part of his doctrine that he used it from the beginning as an argument to overwhelm Carlstadt. The evangelical nature of the Sacrament he preserved by asserting that, though the unbeliever participated in the body and blood, they had no part in the grace of which body and blood were vehicles.

The main elements of Zwingli's completed doctrine are these, and the obvious Scriptural derivation of all the points should be noted—e.g. (2) and (3) are founded on the words of institution, (4) on Jn 6, (5) on 1 Co 10—(1) the Eucharist is not a repetition of the Sacrifice of Christ, but the memorialization of the Sacrifice; (2) the bread and wine are signs or symbols of the broken body and shed blood of Christ; (3) the reference of the Eucharist is, therefore, rather to Christ crucified than to Christ glorified; (4) in the Eucharist, Christ is truly our food, and through Him our spiritual life is nourished, but He is appropriated by faith alone; (5) the Eucharist, as a true com-
munion of the body of Christ, is specially significant for the life of the Church community, being the sign and pledge of united allegiance to Christ and his Church. Therefore, he named it

3. The doctrine of Calvin.—Calvin’s teaching on the Eucharist is much easier to define—partly because he appeared on the scene later, when the problems had already been stated and discussed, and partly because he went on from them to seek for any change from the beginning to the end. The later Lutheran controversialists regarded Calvin as a cunning Zwinglian intent on making converts to his teaching by a partial use of Lutheran phrases, while many of the Swiss at first regarded him as a pure Lutheran, whose open and declared purpose it was to undermine the teaching of Zwingli. He stands in the middle, not merely of any need for a bold reform of the whole system of the Church’s teaching, but also of any need for a bold and unswerving adherence to the presence. His statement of the doctrine of Christ’s presence may be summarised thus: (1) that, though the body of Christ is in Heaven, there is a real presence of Christ in the Eucharist; (3) that, because Christ is at the right hand of God, He can be present both in the sacrament and in heaven; (4) that, through the Eucharist, Christ is a real means of grace, because He is in present in order to strengthen our real living union with Him.

In regard to doctrine, Calvin stands between Zwingli and Luther; but not so in regard to mode of administration. There is nothing to justify the wide-spread conception that, while Luther accepted all the old forms except such as were inseparably connected with the doctrine of transubstantiation, Zwingli removed all the ancient customs and, having made a clean slate, constructed therupon a new form which was meagre and sterile. The truth is that, in respect of the alteration in the celebration of the Eucharist, Zwingli was closer to Luther, as against Calvin. Calvin, and more completely, Zwingli, went behind medieval practices to primitive forms. Like Luther, Zwingli removed only the objectionable. He took over the old liturgy, doing away with some parts and altering others (cf. Ebrard, ii. 60 ff., for a description of the Zürich liturgy).

III. HISTORY OF THE CONTROVERSY OVER THE EUCARIST AMONG THE REFORMERS.—The first controversies in Reformed circles concerning the Eucharist were Luther’s controversy with Carlsstadt, and Zwingli with the upholders of the Mass. But we begin at the point where the main bodies of Reformed teaching came into conflict with each other. Zwingli’s teaching, as above mentioned, arose independently of Luther’s and from another point of view. That teaching might have been tolerable to Luther but for three things. (1) He always associated Zwingli with Carlsstadt. As early as 1524 he wrote to Asmus: ‘Carlsstadt’s poison is spreading in Switzerland.’ (2) At first he knew Zwingli’s teaching only by inaccurate reports. (3) Zwingli represented a different political ideal. He breathed the free democratic air of Switzerland, which to Luther, with his experience of the French Revolution, was objectionable.

Passing over Zwingli’s letter to Alber—which, however, is noteworthy as containing his most radical views—the real controversy began with Bugenhagen’s attack on Zwingli, ‘Contra novum errores de Sacramentum,’ etc., which is mostly an echo of Luther’s against Carlsstadt, and seems to know no more of Zwingli’s teaching than that by est he understood significant. Zwingli in his answer meets his opponent on his own ground, and defends his interpretation.

*Which explanation of the words is the more violent—yours, by which you say, “Bread is bread, but in the bread is eaten the body of Christ”; or ours, when we say that the words are figurative, and then explain the figure “(oic est, nonne symphonia, figura, etiam verum est corpora mei, quod pro vobis traditur”’? (Responsa ad Bugenhagensis Epistolam.)

Almost simultaneously with the Responsio appeared a contribution from Oecolampadius, De genuina verboverum Doctrina, etc., expositionis. This work, unlike Zwingli, started from a theological conviction, and, also unlike him, set forth no complete theory, and no firm connexion with the death of Christ. To outsiders it therefore conveyed the impression that the whole innovation was a meagre product of a particular egesxis. This exposition, being dispatched to the Swabian preachers,
produced an answer, the Swabian Syngamma — the work of Brenz. Here the terminology was Lutheran, as it was to the theology of Calvin. It took a dynamical presence: the body is in the bread, just as the power of healing was in the Brazen Serpent, through the word (‘Jah, ut serpens versatus contemuit serpentem alias, cur non in sua coena verum corpus ad panem ferret’). Gecolampadius answered in his Antisyngamma, taking the Syngamma sentence by sentence, replying at length to criticisms of his exegesis, and flouting that the analogy of the Brazen Serpent proved no more than a presence in the Sacrament similar to that in the Word. In the meantime, Pirkheimer of Nuremberg had also replied to the expositio. This controversy is for two reasons worthy of mention. It was here that the Lutheran ubiquity theory first made its appearance; and it was from Pirkheimer that Luther got his knowledge concerning the doctrines and personalities of the Swiss Reformers; and Pirkheimer’s opinion had been coloured by Erasmus’ later view of the Swiss Reformers as fanatics and revolutionaries.

And now, Bucer and the other Strassburg Reformers, who had sought in vain to mediate between Luther and Carlstadt, tried to bring about an understanding between Luther and Zwingli. Their envoy, Chaselsius, brought back the answer from Luther that they had to wait for a time, to see whether either or both of them must be the servant of Satan. And in his preface to the Syngamma, Luther now openly joined in the conflict. The fanatics were wrong, he said, because they were so divided among themselves. To this Gecolampadius answered directly; Zwingli contented himself with his ‘Clear Instruction concerning the Lord’s Supper’ — the first of his sacramental writings in German — in which he developed his views in opposition to Luther, but without naming him. It was written to justify his position to the people. A little later he published his Amica Exaggesis, to justify his position to the learned. Sent to Luther, it crossed his sermon ‘On the Body and Blood of Christ against the Fanatics,’ which was answered by Zwingli, immediately on its reception, in his Fründich Verleugnung. In this he says that ‘Martin Luther stands in his poor judgment as high as any individual can, but yet God is higher.’

Every year the controversy grew more acute, with an exchange of tracts every few months, until in 1527, Luther issued his ‘That the Words of Christ, ‘This is my body,’ still stand firm.’ Zwingli replied in his ‘That the Words of Christ, ‘This is my body,’ would eternally keep their ancient and sole meaning; and Martin Luther with his last book has not made good his own and the Pope’s Interpretation,’ upon which Luther rejoined with his larger Bekennniss vom Abendmahl (1539).

What were the main points at issue in this controversy? The incorporation of the words of institution stands always in the foreground, but only a minor part of the real difference appeared there. In part it became a Christological controversy — Zwingli counselled Luther, with his communio idiomatum, of Docetism; Luther charging Zwingli with a Nestorian aloiosis. In regard to the Eucharist itself, the whole matter hinged on the thought that Christ himself said ‘This is my body’ and ‘This is my body,’ still stand firm. Zwingli it was expressly denied: (1) that the body were, if not corporeally eaten does or can confirm faith; (2) that the body of Christ corporeally or naturally eaten can or does forgive sin; (3) that the body of Christ is corporeally or naturally eaten can or does forgive sin; (4) that the body of Christ can be corporeally present in the elements, for He is seated at the right hand of God. By Luther it was asserted: (1) that in the One true Christ there is to be found the body, the heart, the soul, the blood of Christ; (2) that whoever accepts the miracle of the Incarnation has no ground for doubting the presence of Christ in and with the elements; (3) that Christ is not shut up in bread and wine; (4) that Christ himself taught; (5) that it is necessary for Christ’s body and blood to be in the Eucharist to assure the believer of the forgiveness of sins.

As the controversy grew more acute, the combatants became more isolated from each other, and as, all the time, the forces of reaction were gathering strength, Philip of Hesse resolved to bring the two sides together; and, after great difficulty, with the useful help of the usual middleman, Bucer of Strassburg, a conference was arranged for Marburg, and took place in the castle there in October 1529. After private conferences between Luther and Gecolampadius, and Zwingli and Melanchthon, came the public conference. Luther’s first action, as eye-witnesses on both sides assert, was to write with chalk upon the table ‘Hoc est corpus meum’ as a sign that he would not write a word. The arguments of the controversy were used over again, but with none of the old bitterness.

To Luther’s interpretation, Zwingli opposed John 6 as discrediting it, and the familiar ground of the sesio ad dexteram and the ‘ubiquity’ of the body, as possible. ‘If men cannot or do not wish to take these occasions did there seem likely to be an open quarrel. But no agreement as to the mode of presence was reached.

The Marburg conference, says Kolbe (PBR xii. 255), served more to the true understanding of the differences than to bridging them over. But it certainly was not fruitless. There was a mutual undertaking to cease from controversial writings. The two parties came to an understanding on every point save one — an agreement recorded in the fourteen Articles. In regard to the Eucharist, they came to see that one side had been misinterpreting the other — the Zwinglians in attributing to their opponents a Capernatic eating, and the Lutherans in regarding their opponents as holding to a mere memorial. After acknowledging in the Supper a spiritual enjoyment of the body and blood of Christ, the document concludes: ‘But, although we have not at this time come to an agreement as to whether the true body and blood of Christ are corporally in the bread and wine, and that we do not judge that Christian love towards the others, as far as the conscience of each will allow; and both parties ought diligently to beseech Almighty God to afford us the right understanding by His Holy Spirit.’

Within a few months of the Marburg Articles came the Augsburg Confession. Under what influence the tenth Article was drawn up is a matter of debate. The ‘under the form of wine and bread’ of the German version seems designed to conciliate the Roman Catholics, though it may be a mere protest against communion in one kind; and certainly the rest of the Article in German and the whole in Latin seems a drawing nearer to Zwingli: ‘De Cena Domini docent, quod corpus et sanguis Christi vere sano, et distributur venerabilibus in Cena Domini: et improbandum secum docentur’ (Schnell, Cracovia, New York, 1867, ill. 19). This Article, drawn up at the beginning of the altered edition of the Augsburg Confession, at the time no man questioned his right to do this, as he had drawn up the original. Now, in the Parris this article reads: ‘De Cena Domini docent, quod panem et vinum ex eis constituunt corpus et sanguis Christi, et distributur in Cena Domini: et improbandum secum docentur.’ The article is important historically. Under the influence of Calvin, as some maintain, or by reason of an independent approximation to Calvin’s teaching, Bucer and Melanchthon put forward this eleventh Article in the altered edition of the Augsburg Confession. At the time no man questioned his right to do this, as he had drawn up the original. Now, in the Parris this article reads: ‘De Cena Domini docent, quod panem et vinum ex eis constituunt corpus et sanguis Christi, et distributur in Cena Domini: et improbandum secum docentur.’
public controversy against it. In 1544, in his last Eucharistic writing before his death, he had rebuked the unscriptural innovations of a false character and reminded his readers that Christ’s body and blood have been given to us under the species of bread and wine in order that we might believe in his kingdom, to have our life changed, and to reign with him. These words of Calvin became a frequent theme in the discourse of the Reformed Church, and Loofs, using them, used them as the basis for his Discourse. Calvin’s answer to the question of the Supper is typically Reformed, and he maintains that the Supper is not a liturgical rite, but a sacrament. The Eucharist is not a meal, but a sacrifice, and the elements are not simply bread and wine, but the body and blood of Christ. Calvin wrote extensively on the subject of the Supper, and his ideas were widely influential in the Reformed Church.
which declares that by kneeling no adoration is intended to the actual corporeal and voluntary sacrifice, i.e., or any corporal (in 1552, "real and essential") presence of Christ's natural flesh and Blood, and Blood of our Saviour Christ are in Heaven, and not here; it being against the truth of Christ's natural body to be at one time both here and in Heaven. This rubric referred to as being offensive to Lutherans, and restored in the form quoted above was promulgated in 1586, by the Revision, as Drury (Elevation in the Eucharist, Cambridge, 1607, 181), "restored to our Church a complete representation of what our Lord and Saviour Jesus Christ did, as a sacrifice in the sight of God, He was betrayed." We "take the bread" and "take the cup" as a memorial of Christ, and would further believe that He said, we took the bread and bless the cup as He did, and we perform these significant actions openly in the sight of the people and thus "proclaim the Lord's death till He come."

As the result of the composite nature of the Prayer Book as a whole, the Church of England, and a Low Church or Evangelical party in the Church of England. The former came into prominence with the Oxford movement.

In Tract 90, Newman attempted to show that the Articles, though the product of an un-Catholic age, were "patient of a Catholic interpretation." By the aid of a return to medieval ritual, attempts have been made to get behind Article 31, "Of the one Oblation of Christ finished upon the Cross." The question of ritual reached its most acute point in the Union Act (1558-59) and the MacCormack case (1597-98). High Churchmen speak of the Eucharist as a Sacrifice. Ridley had spoken of the "unbroken" and "uninterrupted" representation of the激情 sacrifice (Works (Parker Society, Cambridge, 1841, p. 256). The theory advanced by Hooker, and outspokenly and unreservedly condemned by Brightman (The Eucharistic Sacrifice, 1896), that the Eucharist is a sacrifice because "our Lord's sacrifice continues for ever and has a perpetual sacrifice, that is, the earthly counterpart of the sacrificial oblation which is being carried on in the heavenly tabernacle," for which a great weight of authority has been claimed, has been shown by Mortimer (The Eucharistic Sacrifice, London, 1901, p. 379 ff.) to have been derived through Mead from Chancellor. The controversy concerning the Eucharistic Sacrifice and its ritual development.

The teaching of the majority of the Nonconformist Churches in England and their sister-Churches in the United States and the Colonies, despite the ultra-Zwinglian Declaration of the Congregational Union of England and Wales in 1833 (Schaff, Creede, iii. 731 ff.), that the Lord's Supper is "to be celebrated by Christian Churches as a token of faith in the Saviour, and of brotherly love," is Calvinistic; and in most of administration they belong to the "Reformed" type.

V. THE ROMAN CATHOLIC DOCTRINE.—The Roman Catholic Church rests entirely on the development described in the preceding article. The Council of Chalcedon first gave Constantinople an embodiment to the distinction between the Eucharist and the Mass; and, though the decrees gave more space to the "sanctissimum sacramentum Ecclesiaæ", in theory and practice the sacrificial aspect (the Mass) completely overshadows the sacramental character (the Eucharist). The Tridentine decrees were a blend of conflicting medieval theories, one party wishing to exalt the Sacrifice of the Mass, the other unwilling to obscure the Sacrifice on the Cross.

It is a real propitiatory sacrifice: "Sic quis dixerit, Missæ sacrificium . . . neque pro vivis et defunctis pro peccatis, poenis, satisfactionibus et aliis necessitatis offerdi debet: absit semper" (Sess. x, c. iii. The Mass, unless performed by the priest, is no sacrifice. And yet the priest, not the other. Christ offered Himself once on the Cross, and He offers Himself daily on the altar. For the Mass is a sacrifice, and it is a sacrifice."

But the Catholic Church teaches that the sacrifice of Christ is immutably efficacious, and the thought of repetition, though present in the pre-Reformation time, is a heretical teaching, by a repugnance (mo33, 53 ff.). Post-Tridentine teaching went far beyond mediæval limits (Schreiber, La Dogmatique, Paris, 1832, iii. 310 ff.). Aquinas had taught that the Sacrifice of Christ is immutably efficacious, and the thought of repetition, though present in the pre-Reformation time, is a heretical teaching, by a repugnance (mo33, 53 ff.). Post-Tridentine teaching went far beyond mediæval limits (Schreiber, La Dogmatique, Paris, 1832, iii. 310 ff.). Aquinas had taught that the Sacrifice of Christ is immutably efficacious, and the thought of repetition, though current in pre-Reformation time, is a heretical teaching, by a repugnance (mo33, 53 ff.). Post-Tridentine teaching went far beyond mediæval limits (Schreiber, La Dogmatique, Paris, 1832, iii. 310 ff.). Aquinas had taught that the Sacrifice of Christ is immutably efficacious, and the thought of repetition, though current in pre-Reformation time, is a heretical teaching, by a repugnance (mo33, 53 ff.). Post-Tridentine teaching went far beyond mediæval limits (Schreiber, La Dogmatique, Paris, 1832, iii. 310 ff.). Aquinas had taught that the Sacrifice of Christ is immutably efficacious, and the thought of repetition, though current in pre-Reformation time, is a heretical teaching, by a repugnance (mo33, 53 ff.).

EUCHITES (Eûxîres or Eôxîres, from εὐχή, prayer).—A sect whose leading tenet was that sin could be subdued and perfection attained by the practice of perpetual prayer. This sect, which was an outgrowth of Syrian monachism, they propagated their ideas from the second half of the 4th cent. till the 6th, and traces of their influence are to be found at a much later date. They were otherwise named, after those who at various times were their leaders, Lampetians, Adelphians, Eustathians, and Marcianians; or, from some of their most striking peculiarities, Messalians (their commonest designation [Aram, ܐܘܛܝܝܐ, from ܫܡܐ, to pray], as in Du 6°, Ezz 6°]). Choreutes (χορεύται, from their mystic dances), and Enthusiasts (ἐνθυσταῖς, from their claim to possession of the Holy Spirit). It is somewhat difficult to determine their true character and teaching, because no information that has reached us regarding them comes from their opponents, the heretical literature having almost completely perished. The chief writers who have their opinions and practices are Epiphanius (Hr. 80), Theodoret (Hr. iv. 17), Hr. iv. 11), and Timotheus Presb. (in J. B. Cotelerius, Ecc. Gr. Mon., Paris, 1777-86, iii. 406). Their primary statement, written in a "Scripture before the ascetics," is often referred to, and it furnished John of Damascus with the heads of the impious doctrine of the Messalians taken from their own book" (Cotelarius, l. 302).
It is impossible to say whether their practice grew out of their theory, or their theory was squared with their practice. They taught that every crime was punished by a demon who incites him to sin. For the expulsion of the evil spirit baptism is ineffectual (δο άγιον βάπτισμα ϒύδι συμβάλλα τό [Timoth. loc. cit. 2]). It only "serves" to the soul who is the root of the evil untouchable. The true remedy is intense prayer, unremitted till the departure of the evil spirit is sensibly perceived. Sometimes the Holy Spirit is seen to enter in the appearance of an intense light or smoke, and to pass out of the mouth in the form of a saw with her litter (Augustine, Hist. 57). Then ensues the happy time when "the soul is as sensible of union with its heavenly bridalchamber as an earthly bride in the embraces of her husband" (Timoth. 4). The Enchite henceforth regards himself as a partaker of the Divine nature. Frequently he ends in a pantheistic self-deification (Neander, ii. 349). If an angel, a patriarch, a prophet, a royal or an apostle be named to him, he will reply in each case, "That am I myself" (Epiphanius, loc. cit.). As spiritual men, the Enchites alleged that they had visions such as were granted only to religious people. They danced in order to trample on the demons which appeared to them. They had also prophetic gifts, they knew the state of departed souls, and they had power to read the hearts of men. They regarded all the Church's ordinary means of grace, e.g. the Eucharist, as well as the discipline of the monastery, with indifference. Professing to give themselves entirely to prayer, they did no work, but lived as mendicants. Bands of Enchites of both sexes roamed about, as persons who had renounced the world and all its possessions. In summer they slept promiscuously in the streets of towns. They were suspected of believing that they could indulge in unbridled licentiousness without falling from their perfection. That may have been a calumny, but undoubtedly a nemesis often overtook the presumptuous self-confidence which ignores the radical weakness of human nature.

Edessa was one of the first centres of the Enchite heresy. Flavian, bishop of Antioch (c. 390), sent a body of monks thither to summon the false teachers before him. As he knew that they would, according to their custom, deny their doctrines and charge their accusers with slandering them, he resorted to a stratagem. Affecting to side with the accusers, he induced Adelphius, the aged leader, Adelphius, to disclose all the secrets of the order, and then rounded upon him with the stern words of Daniel, 'O thou that art waxen old in wickedness, now are thy sins come home to thee' (Susanna 2). Adelphius and his comrades were beaten, excommunicated, and condemned to exile, without the option of recanting. They went to Pamphylia, where they were again condemned in a Synod held at Side, and presided over by Amphilochius of Iconium. Proceedings were also taken against the sect in Armenia, and they gave trouble in Constantinople. Theodosius legislated against them (vi. Cod. 187), and Valerian and Amphilochius of Side had the book Accinctus condemned at the Council of Ephesus (431). Lampetus, the first of the sect to obtain the dignity of the priesthood, was summoned before his bishop, Alypius of Cesarea (Cappadocia), on a double charge of undue familiarity with women and of deriding the medical services of the Church as a mere bondage. He was found guilty, condemned, and degraded. He wrote a book called the 'Testament,' which is lost, but a fragment of Severus the Monophysite's answer to it is preserved (J. C. Wolf, Analecta Graecae, Hamburg, 1728-24, ii. 182). The Enchite leader in the 6th cent. was Marcellian, whom one of the Popes pronounced orthodox. Little more is heard of the sect till it reappeared in Armenia at the end of the 12th century. The Bogomils (g.v.) had their origin in Bulgaria, and were without doubt the connecting link between the so-called philosophical sects of the East and those of the West (EB 1 iv. 119). They were also known as the 'Paulicians' (from Paul of Samosata), whose doctrines survive in the great Russian sects. See, further, art. PAULICIANS.

JAMES STRAHAN.

EUDAMONISM.—Eudaimonism may be defined as the theory that the ethical end, the ultimate object to be achieved by action and conduct, the standard and the criteria of human well-being, is Welfare (eudaimonia). Welfare is not to be regarded as identical with happiness, although the latter term has been widely and even generally employed as its synonym. While 'welfare' (Wohlfahrt) more truly represents a happiness, of course, be so defined and understood by a moral philosopher as to become the technical equivalent of 'welfare' (Aristotle's eudaimonia); but this involves an unnatural divorce from the meaning which it bears in ordinary speech and literature, where 'happiness' undoubtedly connotes pleasure as an essential and predominant, if not as its sole, constituent, and signifies, in fact, 'a life full of pleasures, well selected and arranged' (Mezes, Ethics, London, 1901, p. 397). Now, although welfare may be held to consist of pleasure, that theory (Hedonism) imports so great a difference that, 'in whatever of its several forms it be maintained, it stands apart and calls for separate treatment (see art. Epicureans, Hedonism, Utilitarianism).

Eudaimonism finds its typical exponent in Aristotle, whose famous definition of welfare (eudaimonia), or man's ultimate good (ρο άνθρωπων άγαθον)—activity, or exercise of the powers, of soul according to virtue or goodness, and that the best and most fully developed—that has the high merit of elasticity, leaving room alike for individuality and for discovery in the conception both of psychical activity and of moral excellence. Only it is clear that well-being is founded and rooted in well-doing.

In modern philosophy Eudaimonism proper, as distinct from Hedonistic Utilitarianism, has few representatives. Perhaps Cumberland, who makes 'furtherance of the common welfare' the ethical end, and, after him, Huxley and Butler, have the best claim to be so regarded; and, in our own day, Paulsen, with whom 'acts are called good, when they tend to preserve and promote welfare; bad, when they tend to disturb and destroy it' (System of Ethics, Eng. tr., London, 1899, p. 222), welfare 'consisting in the perfect exercise of all human psychical powers' (ib. 224).

It is of the essence of Eudaimonism that it is teleological: it looks forward and makes for an end, and that end is not precisely, or mainly, 'rightness,' which implies a pre-existing rule or lawgiver. Herein it is contrasted from all that class of ethical theory which is retrospective and introspective, bidding us look back to a law once delivered, or inward to a perpetual and infallible monitor dictating duty with its consequences. Unlike every such 'intuitional' theory of morals, Eudaimonism does take account of con-

1 De Legibus Natura, London, 1672, ch. 72.
sequences, not only of those immediate consequences which even for the intuitionist commonly form part of the act intended to be done, but (which is the crucial matter) of manifold consequences that lie, foreshow, or pictured, in the far or middle distance.

Of Eudoxianism, which is likewise teleological, we may fairly say, with Wundt (Ethical Systems, Eng. tr., London, 1897, p. 187), that practically it 'coincides with Eudemonism,' though with the form of a restriction that the duty of moral self-development, as a means, however, not barely to self-perfection, but thereby to the welfare of our fellow-men. This identification will bring the school of Leibnitz into the ranks of the eudaemonists. At the same time it marks the difference between ancient (or Aristotelian) and modern Eudemonism. The former was primarily individualistic, notwithstanding that for Aristotle membership of a State is indispensable to human welfare. The latter is profoundly altruistic and universal. Now, individual perfection, excepting for Plato, is not manifestly the same as individual welfare, whereas universal perfection may reasonably be identified with universal welfare—the welfare of all human or, as some authorities would have it, of all sentient beings.

See, further, Ethics, and the Literature there cited.

EUDOXIANISM.—Eudoxianism denotes the opinions, especially on the Arian controversy, held by Eudoxius, who was born about A.D. 305, and became successively Bishop of Gerasanca in Comagene, of Antioch (A.D. 358), and of Constantinople (A.D. 369-370). The materials available for ascertaining his views are very scanty, consisting chiefly of his 'Confession,' a fragment of a work on the 'Incarnation,' which has been preserved in a collection made by the presbyter Anastasius. Inferences as to his opinions have also been drawn from his conduct at certain crises, and from one or two sayings he is reported to have uttered. One of these is a scurrilous sentence from a sermon delivered by the Bishop of Antioch and referred to at the Council of Sardica (Hil. Lit. Hist. of Dogma, iv. 1898. 75 ff., 147); F. Loofs, art. 'Eudoxius,' in DBE ii. (1898) 557; W. Harnack, art. 'Eudoxius,' in DICC ii. 1899. 355.

EUGENICS.—See Marriage, Sociology.

EUHEMERISM.—The term 'Euherism' is often applied in a general though quite unwarranted sense to the rationalistic interpretation and disintegration of Greek mythology. As a matter of fact, the romantic tale compiled by Euhemerus of Messene marks but a single phase of religious-historical thought in the 3rd cent. B.C. and the period following, and it is only the influence exercised by this work on the Romans, and, through them, upon modern rationalism, that has given the term a significance by no means commensurate with the actual achievement of the man from whom the movement derives its usual name. For, when all is said, the teaching of Euhemerus has but little claim to be called original. Prior to his time reflection on religious things had undergone a fairly long process of development. The roots of Greek rationalism lie far in the past. The Greek historian Hecatoec had already dealt with ancient legends on rationalizing principles, and his example was followed by Herodotus and Herodorus, while the Cynics Antisthenes and Diogenes had sought to re-interpret the myths in a sense peculiar to themselves.

Strictly systematic reflection on religious things had undergone a fairly long process of development. The roots of Greek rationalism lie far in the past. The Greek historian Hecatoec had already dealt with ancient legends on rationalizing principles, and his example was followed by Herodotus and Herodorus, while the Cynics Antisthenes and Diogenes had sought to re-interpret the myths in a sense peculiar to themselves.

Some knowledge of the work of Hecatoec seems to be presupposed in the Περὶ Αὐθεντικῆς of Euhemerus. In this book—written perhaps c. 280 B.C.—which purports to be the narrative of a journey, and is composed in the spirit of the numerous political Utopias of the 4th cent. B.C., Euhemerus gives a description of certain happy islands which he pretends to have discovered on a voyage from the Red Sea to the Indian Ocean. This romance of travel, the surviving portions of which are found in Diodorus (v. 41—46, vi. 1), as also in the fragments of Ennius preserved by Lactantius (Dito. Nat. xi. 1.
Varro perhaps being the intermediary—professes, in particular, to give a sketch of the fabled island of Panchaia, which is here depicted, however, not in Homer's wonder-land, but in a relatively sober and persuasive manner—artifice by which Euhemerus hoped to facilitate his readers' acceptance of his theology, for this was in reality his great undertaking. As a rule he proceeds to tell us that he had discovered on the island a temple of Zeus, and therein a pillar of gold on which Zeus had inscribed in sacred script his own deeds and those of Uranos and Kronos. Then, all that had ranked as divinity was brought down to the human level, precisely as in the work of Heracleus, whose views seemed in this way to gain some sort of documentary corroboration. In particular, Zeus himself was now no more than a ruler who had given a powerful impetus to civilization, who had completed the dissemination of his cult by erecting the sanctuary in Panchaia, and who ultimately died as a true king.

This narrative, of which we have given only the most essential particulars, was generally repudiated and pronounced a fabrication by the more earnest minds among the Greeks (cf. Callimachus, Hygm. i. 1. 86; Ptolemy, Ptolemaic History, xi. 13. 1; Polybius); Plutarch, De Is. et Osir. 23); but, as was noted above, it had a great influence upon the Romans, amongst whom it became naturalized in the later rendering of Ennius. It thereby became known to the Roman Christian writers (Minuc. Fel., Oct. 21; Lactantius, loc. cit.), who were as ignorant of Euhemerus in the original as of the Gr. apologists (Theophilus, ad Autolycum, iii. 7, furnishes no evidence on the point), and it was through their influence that Euhemerus and his work became immortal, and his theology passed into a proverb.

It is, accordingly, all the more necessary to insist upon the fact that in Euhemerus we have but a single—though, it may be, the most notable and competent—representative of the spirit of the age. Just as—unless all the evidence is fallacious—he had a forerunner in Heracleus, so he was followed by others who shared his views. Thus, while we cannot fix precisely the date of Leon of Pela, who fabricated a letter purporting to have been written by Alexander to Olympeion, the latter is often quoted by the apologists, and setting forth ideas akin to those of Heracleus—he unquestionably belongs to this period, and must be regarded as an exponent of Euhemerism (Eusebius, Geschicht der griech. Epochen, Leipzig, 1897, p. 223). Then, in the 2nd cent. n.c., Dionysios Skythobrachion, who is referred to by Diodorus (iii. 56; 57: 2: 60: 3 and 5; 70: 3, 7; 87: 11: 5; 72: 1: 4; 73: 1: 5, 5), followed on the lines of Euhemerus and his predecessor, maintaining that the gods were ancient kings who—as was specially exemplified in the case of Dionysus—had been promoted to divine honours for their services to civilization. Finally, at the end of the 1st cent. A.D., Herennius Philo of Byblus, in his Sanchuniathon, applied the same process of transmutation to the Phoenician deities (Enseh. Phys. Evang. i. 6, p. 20 ff.). The work of Palaios scholarchos (ed. J. de Vogli, Mythologi greeci, iii. 2, Leipzig, 1902) cannot now be regarded as directly relevant to the point before us. (Cf. with reference to the views developed in the foregoing, F. E. Wissowa, Die homer. Kultur, Berlin, 1896, p. 102 ff.; Jacoby, in Pauly-Wissowa, vi. 952; Wendland, Die hellenist.-röm. Kultur, Tübingen, 1912, p. 116 ff.)

Apart from a number of works in a dual character, generally rejected by Greek writers of the more earnest type, and especially, of course, by such as had engaged in research. It is, neverthe-
food for man, and, on the other, the gloomy depth of Hades. We find, accordingly, that in the Peloponnesian well-disposed deities of the earth were worshipped as Eumenides (Pausan. ii. 11. 4; cf. viii. 34. 1 ff.), and Preller-Robert, Griech. Mythol. (1864, i. 567). There they are also designated Πνεύματα or 'Αδόνιες, and in Athens, on the Areopagus and at the Demos Colonus, the Hesiod (Paus. i. 28. 6), while this name, as also the title οὐρανίας was likewise applied in a descriptive sense to Demeter and Kore (cf. Preller-Robert, i. 747). Such deities, in virtue of their chthonic character, were represented in the cultus as bearing not only flowers and fruits, but also the figure of the snake, which is found among many peoples as the symbolic animal of the dark and gloomy underworld. For in the earth underneath lie the souls of the dead, the haggard spirits whom those who still live on the earth must charm and propitiate; while, under a different name, these earth-deities are the avengers of murder, especially the murder of a blood-relation. It is true that even here the data remain somewhat obscure, for it seems as if the οὐρανίας was in general the angry soul of the murdered person himself rather than a deity who avenges the crime wreaked upon that soul. To all appearance Hesiod (Theog. 217; cf. Esch. frg. 928, 1. 47) identifies in the Erinyes the deities with the Κόραι, who must also be regarded as souls. And, since it is thus impossible, as has just been indicated, to attain to absolute certainty at this point, we must be content to verify some of the more outstanding features of the myth in its primitive form.

Now, it is so far an advantage to have ascertained that the avenging deities who punish the crime of matricide are here identical with the beneficent spirits of the underworld. The cause of a murdered man was in general taken up by his family group; but, when one individual in such a group killed another, the deed was accounted more atrocious than an ordinary homicide; and, as in this case the avenger could not fittingly be supplied by the family itself, the task of executing justice on behalf of the wailing soul of the slain was undertaken by the deities of the sombre depths. Thus the death-blow which Meleager had dealt the brother of his mother is, at her request, avenged upon him by the ἀρμοστὴς Ἐρήνης (II. ix. 571); and we are told in his xii. 280 that Clytemnestra, who was not directly guilty of her mother’s death, yet for him Εἰκιστὸς left pains behind, "all that the Erinyes (‘Avengers’ [Butcher and Lang]) of a mother bring to pass (Σῶσθν τε προτέρως Ἐρήνης ἐστιν, οὐς οὐδὲν):" Here, however, we can already trace the genesis of the finer and more spiritual idea that the Erinyes are the curse, or curses (ἀπολ.), of one who has suffered any kind of injury at the hands of a relative. Thus Telemaques is apprised of his mother’s curses (Od. ii. 135; cf. II. xxi. 412), while in Hesiod (Theog. 472), Rhea desires that Kronos shall propitiate the ἀρμοστής, i.e. in this case—the curses of his father; and, similarly, in Hygin. (Fab. 171) Heracles present themselves to Athene as the Ἁπατή (cf. Soph. Eidol. Col. 1375, 1391; Blass, Einleitung zu d. Eumeniden des Aischylos, Berlin, 1907, p. 21). In this way the Erinyes are lengthened to be protectresses of the constitutional family law in general; when a household was bereft of parents, their place was taken by the eldest brother, whose prerogative was now maintained by the Erinyes (II. xv. 294). Finally, when the hero is away from home, there comes the case of the much lamented Achilles (xix. 418), they seem to assume the function, if we may so express it, of maintaining the normal order of Nature. As they are thus the handmaidens of justice upon earth, they are also the guardians of oaths and the avengers of perjury (xix. 259; Hesiod, Op. 803 f.), and, accordingly, in the court of the Areopagus at Athens the judicial oath was taken in the name of the Τιμαίος (Dinarchus, i. 47). On all these details, see Rohde, Psyche, 1898, i. 134 ff.

The Erinyes thus came to be connected with all the power of artistic expression of which Hellenism was capable. The ἀρμοστής travels amid a dark cloud, is 'one that walks in darkness' (περίποτα, see above); the sound of the Erinyes, the ἐρυθρίας, and the ἐρυθρείς, are also figured as hunchresses; nothing escapes their eye; and, like a pack of savage hounds, they pursue the criminal—whose trail of blood they have speedily discovered—till they finally bring him to the ground. Hence Ἑρυθρείς, too, refers to them as the 'mother’s hounds' (Choepha. 924; cf. Eum. 131 f., 146 f).

It was, in fact, Greek poetry, and, above all, Greek tragedy, that gave these creations of popular belief their final form. We cannot fix precisely the period in which the repulsive stories of unnatural crime—paricide, matricide, and incest—first took their rise, and to which, therefore, the legends of Oedipus, Aeneas, and the Atrides are to be assigned. But in any case the Erinyes filled a great role in this particular phase of Greek mythology. This has already been shown in the case of Oedipus. The Erinyes, the Eumenides, the Erinyes of the house of Atreus, while, as regards the myth of the Atrides, we read in Stesichorus, who is our chief authority here, and is of importance also for the development of tragedy, that Orestes, who had killed his mother Clytemnestra, was pursued by the Erinyes, and received from Apollo a bow as a means of defence (frag. 40). The latter detail is one of great interest, as it indicates the early recognition of the symbolic character of the bow light and those of the under world which forms so significant a factor in the Eumenides of Aeschylus. For there the Erinyes are the primeval goddesses whose sole function it is to avenge the violation of kinship; the murder of a husband, which Apollo sets forth before the Erinyes in all its atrocity, is of no concern to them (Eum. 212). In Apollo and Athene, as a matter of fact, the Erinyes are confronted with a new ethical point of view—with the Delphic law of expiation—as also with the claim of the Athenian State to deal in its own right with such deeds as the crime of Orestes. And it is by no means certain that they are reconciled by Athene, and then, as beneficent spirits, pass into the under world beneath the Areopagus. The Erinyes have become the Eumenides. Thus did Aeschylus contrive to introduce ethical harmony into the primitive saga, which, as we saw above, recognized a dual aspect in the earth-deities. Another perpetrator of the crime of matricide was Aeneas, who was likewise pursued by the Erinyes, but was at length released from the consequences of his impiety (cf. Eurip. in Nauck, Fragm. trag., Leipzig, 1886, p. 379; Bethe, Thetis. Heldesm. Leipzig, 1893, i. 138 f.).

We have already noted the fact that the chthonic character of the Erinyes is symbolized by the snake, and on an Argive votive relief (Roscher, i. 1330) each of the three Eumenides carries a serpent in her hand. And, in like manner, the Terpsichore sometimes exhibits corresponding figures (Roscher, i. 1334). They are also provided with wings (cf. Eurip. Iph. Taur. 298), for which we have a further indication of their function as the swift pursuers of their prey. In their hands they hold scythes, and also torches (cf. the vase of Canossa, in Roscher, ii. 126) with which they torment the guilty in the under world.
EUNOMIANISM—The doctrine of Arias

The argument for the second premise, viz., that 'the Ungenerate' is God's name, the only definite proof he seems to offer is the somewhat curious one that long before the creation of man God had the naming of things, seeing that in the earliest of the sacred records, before the creation of man, the naming of fruit and seed is mentioned; and, if of things, how much more would He have the naming of Himself? Once he can establish ungeneracy as the Divine essence above, and he will have nothing to do by a constant misapplication of that which constitutes the Person or hypostasis of the Father to the whole essence [ōn] of Deity, the heavenly origin of the name follows as a matter of course in accordance with his theory of the sacredness of names.

But Eunomius' most elaborate proof, that 'Unenerate is God's name,' is a negative and indirect one. He attacks the mental history which Jesus and Gregory of Nyssa give of the term. He denies that it is due to a human conception, and boldly asserts instead that it is due to a perception as instinctive, spontaneous, and direct as any perception of the senses; the Deity presents it to the mind, and the mind at once grasped it. He pours contempt not only on the orthodox party for treating this and all other private names of the Deity as only privately invented, as a mere perception of the mind, but also upon the faculty of conception itself. It would be dangerous, he considers, to trust the naming of the Deity to a common operation of the mind. The faculty of conception may, and does, take upon itself; it can create monstrousities. Besides, if the names of the Father are conceptions, so also are the names of the Son, e.g. the Door, the Shepherd, the Axe, the 

It was this word 'ungenerate,' so familiar to Greek philosophy, so consecrated in its application to the First Person of the Trinity, that was seized upon to destroy the consubstantiality of Nicea. He saw in it the expression of a positive idea which enabled the mind to comprehend the Deity, and at which the same time, by virtue of the logical position between ungenerate and gener-}

_The Ungenerate_ as the name of God._—Eunomius asserts 'God is ungenerate, absolutely and independently of Himself, and as such shows at once what He is going to make of this by adding of the term 'ungenerate' itself: This name is His glory. It is grafted in our minds from above.' He then constructs the following syllogism: 'To term expressive merely of the absence of a quality can be God's name: the Ungenerate is God's name: therefore it does not express a privation.' But how does he prove his second premise, viz., that 'the Ungenerate' is God's name? The only definite proof he seems to offer is the somewhat curious one that long before the creation of man God had the naming of things, seeing that in the earliest of the sacred records, before the creation of man, the naming of fruit and seed is mentioned; and, if of things, how much more would He have the naming of Himself? Once he can establish ungeneracy as the Divine essence above, and he will have nothing to do by a constant misapplication of that which constitutes the Person or hypostasis of the Father to the whole essence [ōn] of Deity, the heavenly origin of the name follows as a matter of course in accordance with his theory of the sacredness of names.

But Eunomius' most elaborate proof, that 'Unenerate is God's name,' is a negative and indirect one. He attacks the mental history which Jesus and Gregory of Nyssa give of the term. He denies that it is due to a human conception, and boldly asserts instead that it is due to a perception as instinctive, spontaneous, and direct as any perception of the senses; the Deity presents it to the mind, and the mind at once grasped it. He pours contempt not only on the orthodox party for treating this and all other private names of the Deity as only privately invented, as a mere perception of the mind, but also upon the faculty of conception itself. It would be dangerous, he considers, to trust the naming of the Deity to a common operation of the mind. The faculty of conception may, and does, take upon itself; it can create monstrousities. Besides, if the names of the Father are conceptions, so also are the names of the Son, e.g. the Door, the Shepherd, the Axe, the

There is nothing to show that the name was used by the Church writers, whether before the 3rd cent. (which Bishop Bull has doubted) or after it (as has been conclusively shown by Lightfoot, Ignatius, vol. ii. p. 900).

Thus 'ungenerate' (υανερα) could be applied to the Son, but not to the Father. Ungenerate remains, then, as alone capable of representing the word which was put in the forefront of the Eunomian heresy, and from which all its conclusions flowed.

As a second argument also by the orthodox, Eunomius' use of it was all the more convincing and plausible.

In the English Term, the word 'ungenerate' there may be a little doubt. Though Gregory of Nyssa, in the opening of the letter, and after con-
This last statement must mean that the Third Person is inferior to the First, as having a cause at all; and to the Second, as proceeding only from the Second and not from the First. In this Eunomism marks his teaching throughout. He goes on:

There must, of course, be included in this account the energies which follow upon Beings of this class. These energies, as it is called, each Being is absolutely single, and is in fact and thought one, and its energies are bounded by its works and its powers; and the name is merely a summation of the name. Of course, the energies which follow these Beings are relatively greater and less, some being of a higher, some of a lower order; in a word, their difference amounts to that existing between their works.

We see that Eunomius holds this (and equally so in all that follows) has translated the terms of Scripture straight into those of Aristotle, and changed the ethical-physical of Christianity into the purely physical. Spirit throughout becomes Being (ēsia), a word which, saying that Eunomius still regards the substance as living, is best translated as above, 'Being'. Nothing else was to be expected after he had so effectually banished the spiritual and moral from his Unergreate that it becomes as physical as the 'Nameless First Manifestation'.

The contents of the above formula amount to nothing more or less than Gnosticism. In fact, the earlier and this, the later Arianism and Gnosticism are, the doctrine of emanations upon Christian theology. For, while Arianism held the Logos to be the highest Being after the Godhead, it regarded this Logos as only the mediator between God and man; just as, before the rise of Arianism, it had been the peculiar aim of Gnosticism to bridge over the gulf between Creator and created by means of intermediate beings (the emanations). It is also more evident the emanationism which Eunomius, like his master before him, adopted that system of Greek philosophy (the Aristotelian) which had always been the natural ally of Gnosticism. Aristotle is strong in divisions and differences, weak in 'identifications'; he had marked, with a clearness never attained before, the various stages upwards in the physical world; and this is just what Gnosticism, in its wish to exhibit all things according to their various distances from the ungenerate, required, and accordingly made use of. Gregory had reason when he spoke of the followers of Eunomius as 'these Gnostics'.

It is true that Eunomius uses also orthodox terms in dealing with the Trinity. We encounter such in the following creed of his, but the last words preclude any orthodox meaning:

We believe in the Son of God, the Only-begotten God, the first-born of all creation, very Son, not ungenerate, verily begotten before the worlds, named Son not without being begotten before He existed, coming into being before creation, not uncreate (quoted by Gregory of Nyssa, c. Eunom. i. 7).

The gulf had been dug when once ungenerateinity had been proclaimed to be the substance of the Father; and nothing more could pass it. Even the Godhead of the Son seems destroyed, notwithstanding the above articles from Eunomius' creed, in which the Son is presented as the Divine Wisdom, as the Word, as the Logos; but in this case the name is merely an identification, and above, 'First Cause,' 'longing,' 'First Cause,' 'uplifted.' This direct intuition on our part of the Unergnearate manifested a curious inconsistency in Eunomius' own system. We have to suppose that the creatures whom the Word, the Son, by Eunomius' own showing, created, unrelated as they are with the Unergnearate (since He has not made them), nevertheless conceive of and are, beyond their own Creator, all Being who cannot be anything to them: 2. Eunomius' treatment of the doctrine of the Trinity—It remains to consider the use, in detail, which Eunomius made of this primal dichotomy of 'Unergnearate' and 'Generate' as applied to the whole doctrine of the Trinity. His résumé of his re-arrangement of this, as quoted by Gregory, is in his Defence of my Defence, begins as follows:

There is the Supreme and Absolute Being; and another Being, existing by reason of the First, but after It, though before all things a third Being, and being with either of these, but inferior to the One as to cause, to the Other as to the energy which produced It.
he says, of no mean, just like that of 'rational' and 'irrational.' He contemplates, as existing in the 'generate' with reference to the 'un- generated', the same difference between 'rational' and 'irrational.' As the special attributes of the rational and irrational are essentially incompatible, so the nature of the generate is opposed to that of the ungenerate. He says, as far as the irrational has been created in subjection to the rational, so the generate is, by a necessity of its being, in a state of subjection to the ungenerate.

As to the mode and manner of the generation of the Son, Eunomius says the Father begat Him at that time which He chose, and quotes Philo: 'God, before all other things that are generated, had begotten over His own power.' This power was under dominion, and was restrained as to its activity, while the due time of the generation of Christ was still about to come, and to set this power in its natural work. With the cause of delay was, and what it was that intervened, Eunomius does not specify. Not time, not space, he says. 'Let there be no questioning among sensible men on this point, why He did not do so before. For the ungenerate and generate God (if he really could still give to Christ the name God), Eunomius shatters, as with a resistless wedge, the article of regeneration of the ungenerated Light Light, which compares the consubstantiality of Father and Son with the oneness of flame lit from flame. 'As great as is the difference between generate and ungenerate, so great is the divergence between Light and Light.' This is a striking instance how the avoidance of the Scripture terms 'Father' and 'Son,' implying real oneness of nature, made it possible to say almost anything in this controversy. He goes on:

'We know the true Light; we know Him who created the Light after the heavens and the earth: we have heard the Life and the Truth Himself, even Christ, saying to His disciples: 'Ye are the light of the world'; we have learned from the blessed Paul, when he gives the title of "Light unapproachable" to the God over all, and by the addition defines and teaches us the transcendent superiority of His Light; and now that we have learned that there is so great a difference between one Light and the other, we shall not patiently endure so much as the mere mention of the notion that the idea of light in either case is one and the same.

With Eunomius, that is to say, the 'true' is one thing, the 'unapproachable' another. The Incarnation was a still further divergence of the Light of the Son.

'This Light carried into effect the plan of mercy, while the other remaind inoperative with respect to that gracious action.' It was even a further degradation:

'If he (i.e. Basil) can show that the God over all, who is the Light unapproachable, was Incarnate,—or could be Incarnate,—then let him say that the Light is equal to the Light.'

As to the Incarnation itself, the true empyrean (aerous), which according to Scripture is involved in the abstract "in Eunomius' land; and if the Son is created and man is created, He was 'emptied' (Eunomius clings to this phrase) to become Himself, and changed His place, not from the transcendent to the lowly, but from similar (save with regard to the accidental difference of 'bodied' and 'unembodied') to similar both in kind and dignity. The difference between the uncreated and the created no longer constitutes the difference between the two natures in Christ; that difference is marked by dominion and slavery, for 'all things serve God,' while the 'whole creation' is by the former having disappeared, or rather having never existed between the Son and the world! He came to save, it could no longer be shown that the Master was mingled with the Servant, but only that a servant came to be amongst servants. In fact, in

Eunomius' scheme, the Incarnation was a fall rather than a condescension.

'The Ungenerated Light is unapproachable, and has not the power of speaking or expounding affections; but such a condition is germane to the generate.'

The 'coming in the flesh' was quite akin, with Eunomius, to the declension of a transmigrating soul into a lower body, and the transformation of persons, such as Pythagoras had taught. Eunomius represents the generate as intermediate between heaven and earth, the Divine and the human, so as not to preserve the living God, who has an essence mixed and compounded of contrary, which at once stretched out to partake of the good, and at the same time melted away into a condition subject to affections or emotions. So man need feel no gratitude to the Only-begotten God for what He suffers, since it was by the spontaneous action of His nature that He slipped down to the experience of such affections.

His essence, befurred with frail consubstantiality and affinity of nature and moved as men are, was thereby naturally dragged down; and such a transmigration or change does not demand human gratitude! Nothing could show more clearly than this parody the subtle trick of the Christian sect that is so wide the gulf is, and always must be, between Christianity and Eunomianism or any modern revival of it. It was in the very cradle of this last that the Christian 'theologian' per excellence had proclaimed, as the axiom of the new religion, that 'God is Love.'

We do not find the same fullness of statement by Eunomius as to the Spirit as we find in his treatment of the Son. This is little to be wondered at. The doctrine of the Spirit had not yet come to the front in controversy; with the exception of the heresy of Macedonius, who was forming his sect at the very time when Eunomius was teaching, no heresy was connected directly with this, and no Council dealt with it. That was reserved for the next century. The final clauses of the Nicene Creed, which affirm distinctly, amongst other truths, the Deity and personality of the Third Person, were, if we are to accept the entire silence of the leading historians as evidence, not added at the Council of Constantinople: they were entirely ignored even at the Council of Ephesians. The New appreciation of the Homounhousion of the Holy Spirit was little permeated as yet by the Christian consciousness of the unity of God. Still the faith in the Holy Spirit was in the Creed. The expansion of the Nicene Creed is found in a work written by Epiphanius seven years before the Council of Constantinople (A.D. 381), and it is probable that the old Creed of Jerusalem contained such clauses, and that Cyril produced them before the Council of Constantinople. But the times were not ripe for this controversy. Still, his system obliged Eunomius to say something about the Spirit; he had to draw his conclusions; and what he says savours of the purely Greek heresies of the next century: "After him (i.e. the Son), we believe on the Comforter, the Spirit of truth," says Eunomius. The omission of 'Holy' is to be noticed; doubtless it is because, being aware of the Scripture expressions, 'God is Spirit' (Jn 4th RVm), 'the Lord our God is Holy' (Lv 19), he may prepare the way, by the omission of one at least of these glorious titles, for the still further subjection of the Spirit. So he continues: 'Once for all made subject,' but does not specify what this subjection is. 'Who came into being by the only God through the Only-begotten.' The term 'the only God' prepares for what is coming, and shows what value to attach to the whole. The Father employs the Son as an instrument for the production of the Spirit. 'Neither on the same level with the Father,
nor conumerated with the Father; nor on an equality with the Son, for the Son is Only-begotten, having no brother begotten with Him. This is, of course, consistent with Eunomius' previous interpretation of the Scripture words πωτορότοκος τῷ κτιστῷ as actually meaning 'first-born amongst many brethren,' i.e. the whole creation, including not only the Spirit, but Humanity. Not yet ranked with any other, for he has gone above all the creatures that came into being by the instrumentality of the Son, in mode of being, and nature, and glory, and knowledge, as the first and noblest work of the Only-begotten, the greatest and most glorious.' Eunomius concedes much to the glory of the Spirit, but he is pledged by his emanationism to His subjectivity. We must discount the value of what follows. Eunomius does not read any text in Scripture about the Spirit in the light of other texts.

"He, too, being one, and first and alone and surpassing all the creations of the Son in essence and dignity of nature, accomplishing every operation and all teaching according to the good pleasure of the Son, this god by this, and deriving truth from Him, and declaring to those who are instructed, and guiding into truth." Again: "accomplishing every operation and all teaching of the saints," "conspiring with the Father, useful for the understanding and contemplation of things apposite to the knowledge of God, strengthening us in godliness, lightening souls with the light of knowledge," "emboldening the faint-hearted," "acting as a guide to the infirm," "approaching the mystic 'distributing every gift,'" "vanishing deaths," "healing the sick," "comforting the afflicted," "overcoming the distresses of mankind." Orthodoxy could not have a word to say against all this, for it is true scripturally, only Scripture attributes all these very operations to the Father and to the Son as well, or implies that they must be ascribed to both. But Eunomius, while bestowing his own doctrine upon Scripture, perforce ignored this. His principle once laid down at the first, that the energies and works are consaceous with the Beings which they follow, and are accordingly superior or inferior as the Beings are, prevents any of these operations of the Holy Spirit from being purely Divine in His eyes. The fatal separation and subordination of the Beings lead to a still more fatal separation and subordination of the works. As redemption itself by the incarnation, being the Son's work and not the Father's, was rather a symptom of weakness in Him than an evidence of the power of Divine mercy, so the work of the Holy Spirit, being not the Son's nor the Father's, is no more to Eunomius than what might be attributed to some human teacher, e.g., to be sent, to receive, to announce, to suggest the truth, to have God Himself whispering in the heart of man.

To this emanationism ingrained in his system we must, of course, attribute the curious insistence of Eunomius on the Father being the principal of the Son alone: the 'energy' of the Son produced the Spirit as the 'energy' of the Father produced the Son. Was it only reverence for the words in Jn 15, or was it also the spectacle of Eunomius and many of his co-emanationists, that restrained every Greek Council and every ancient Greek Father from mentioning the Son in conjunction with the Procession of the Holy Spirit? Already Gregory of Nazianzus speaks for them all: 'Standing on our definitions, we introduce the Ungenerate, the Generated, and that which proceeds from the Father (Orat de Filio, ii.).'

As to Baptism, the views of Eunomius can be simply put. He held only by a way of evading it in the following words (as quoted by Gregory of Nyssa, c. Eunom. xi. 5): 'But we affirm that the mystery of godliness does not consist in venerable names, nor in the distinctive character of customs and sacramental tokens, but in exactness of doctrine.' He goes on to say that baptism is not into the Father, the Son, and the Holy Spirit, but 'into an artificer and creator'-apparently excluding the Third Person altogether. Accuracy of doctrine and clearness of statement were to the Eunomians of vital salvation, but not so the claims of the Sacrament of Baptism must disappear altogether with the Divinity of the Spirit, as the claims of the other Sacrament disappear with the Divinity of Christ. Neither could place us, in this system, in communion with this ungenerate God, either in heart and spirit, as the Church could affirm with her living faith in a consubstantial Trinity, or in mind, which was all that the Eunomians would have valued. But for this communion of mind their teacher had provided a better way of his own.

If Eunomius has a title to originality, it must rest on the base he made of this term 'ungenerate,' and it is this peculiar use of it that makes his heresy strange and startling. For 'ungenerate' and 'generate' had been the very terms which the defenders of the Homoeousian had borrowed from the philosophers to set up a believing world that intimacy between the Father and the Son the mention of which was ever on the Saviour's lips, according to the Gospel records. They had compounded the very thing which was the mystery of the new religion. 'Generate,' which had previously connoted nothing but the opposite of 'ungenerate,' had now been brought into closest correlation and union with the Ungenerate; and expressed that which could not otherwise be expressed, in the current philosophical language. But Eunomius employs the terms in order to destroy that very thing which faith had adopted them to teach—the Oneness of the Only-begotten with the God who begat but who is Himself unbegotten. He found these terms within the Church, doing duty, as it were, to make clear that oneness; he employed them, by bringing them back to their former use, to destroy it? Then this dichotomy of his had to be met, e.g. by Gregory of Nyssa, with the counter dichotomy of 'created' and 'uncreated,' which, unlike the other, was founded on an essential difference, and left that which was within the inviolable circle of the Godhead free for ever from any more dichotomies, whatever other assaults might at any time be made upon it.

'Uncreate, intelligible nature is far removed from such distinctions' (i.e. as those of Eunomius, says Gregory (c. Eunom. i. 22). 'It does not possess the good by acquisition, or participate of the goodness of some good, judged above. It is... It is simple, uniform, in composite... But it has distinction within itself in keeping with the manner of its own, but not conceived of with regard to quantity, as Eunomius supposes.'

This was the impregnable position that Arianism also had taken up. To admit that the Son is less than the Father, and the Spirit less than the Son, is to admit, as we have seen, the law of emanation, that is, the gradual and successive degradation of God's substance. By this path Oriental heretics, as well as the Neo-Pagans, had been led to a sort of pantheistic polytheism. Arianism, indeed, tried to resist this tendency, but so far only as to bring back Divinity to the Son. But the Supreme Being of Arians speaks for the Divinity of the Son, who was with Arians as much a created intermediate between God and man as one of the Eons. Eunomius treated the Holy Spirit as his master had treated the Son; complete and decisive method, since his new weapon of ungeneracy created an actual unlikeness between the Persons. Arianism, whether earlier or the later, tended alike to Judaism, and, by making creatures admissible, to Greek polytheism. There was only one way of cutting short the phantasmas of Divinity emanations, without having recourse to the contra-
dietary hypothesis of Arian; and that was to reject altogether the law of emanations as hitherto accepted. Far from admitting that the Supreme Being is always weakening and degrading Himself in the course of emanations from Himself, Athanasius lays down the principle that He produces within Himself nothing but what is perfect, and just, and Divine; all that is not perfect is a work, but only a work, of the Divine will, which draws it out of nothing (i.e. creates it), and not out of the Divine substance.

With regard to the diffusion of Eunomianism, Sozomen says (H. S. 2, 10):

"The heresy of Eunomius was spread from Cilicia and the mountains of Taurus as far as the Hellespont and Constantiople. In a. d. 360 at Byzantium, near Constantinople, 'multitudes resorted to him; some also gathered from different quarters, a few with the design of testing his principles, and others merely from the desire of listening to his discourses. His reputation reached the ears of the emperor, who would gladly have held a conference with him. But the Emperor Flavius Constantius studiously prevented an interview from taking place between them; for she was the most faithful guard of the Nicene doctor." (O. H. G. v. 3, 5).

At the convention, however, of all the sects, at Theodosius' palace in A. D. 382, Eunomius was present (Sozomen, H. S. v. 10). His 'Eθενος η ψωτερας (to which he added learned notes) was laid before Theodosius in A. D. 383. In his answer, Eunomius says "The Empress Anna, Second Book, Gregory of Nyssa finds that Eunomius has still a flock, with whom the former thus expostulated: 'With what eyes will you now gaze? I speak to you, O Book of enduring souls!' This could not have been written earlier than A. D. 384. It was stated at the beginning of this article that he had been a martyr to his cause, and so he was destined still to be. But it was not till 391 that the Emperor condemned him to banishment to Mesia. The barbarians, however, drove him from them; and he was brought to Cesarea, much to the annoyance of the Christians there, who presented the residence amongst them of the enemy of their lost Basil. He died at his birth-place, Dacoara in Cappadocia; and his tomb was visited by all."

EUNOMUS.—The operations of castrating males and of spaying females were probably practised on animals earlier than on human beings; and castration has always been far more commonly performed on males than on females. Castration of horses was known in Vedice India, as is shown by the frequent occurrence of the proper name Vadhryadus ('He who has castrated horses'), and the repeated mention of the ox beside the bull (e.g. Rājveda, v. xxxii. 7, x. cii. 12; cf. further, Zimmer, Altd. Leben, Berlin, 1879, pp. 231, 226). Hомерic Greece was plainly acquainted with the operation of castration (Homer, Iliad, i. 171), and their custom of gelding horses is recorded for the Sceytians and Sarmatians by Strabo (p. 312).

1. Methods and purpose of castration.—The most primitive method of castration of children castrated has been by cutting the testicles, mentioned in Atharvedas, vi. cxxxvii. 2, and implied in a long series of words meaning 'castrated' and connected with base denoting 'crush' and the like.

2. Physical and mental effects of castration.—If castration is performed at an early age, certain准备工作 take place in the body. Certain precautionary measures are employed in the Oriental market. After puberty the operation becomes much more grave. In the case of boys, castration prevents the development of the secondary sex-characteristics—the growth of the beard.

Here belong Lat. capo, 'capon' (Gr. καπόν, 'strike'); Old Ir. mol, 'wether' (Old Church Slav. molot, 'hammer'); Swab. gudan, 'gelding' (Old High German, 'shatter'); Lat. trudo, 'thrust'; Gr. θεθοπη, θεθο, 'emunh' (θεθον, 'emunh'), 'crush'; Swab. etc., Gr. etc., etc., 'crush', 'shatter'; O. H. G. borg, 'castrated boar'; Old Church Slav. бура, 'wether' (L. Жеизо, 'strike'). It is also evident, from Atharvedas, vi. cxxxvii. 2, 4-9, that, besides crushing or splitting the testicles with stones, or with a peg, the penis might also be split.

Besides crushing, cutting was also employed, as shown by such words as Gr. τουλα, 'emunh' (τουλα, 'cut'); Lat. castrum, 'castrate' (Skr. क्रृत्य, 'cut'); Old Ir. mol, 'wether' (Old Church Slav. molot, 'hammer'); Skr. ниршина, 'castrated' (Skr. asti, 'edge,' 'knife'). The operation of dragging the testicles from the scrotum seems to be implied in Gr. σχιστος, 'emunh' ('σχίζω', 'slice'; cf. Skr. मुक्तिकर्ता, 'castrator' (lit. 'he who puts the testicles outside'), Atharveda, iii. i. 2), and, if O. H. G. urfèr, 'castrated,' Anglo-Saxon, æfetræm, 'castrate,' are connected with Gr. αφετρο, 'fire,' the application of hot iron to the testicles may likewise have been employed (on all these terms, see Schrader, Realelex, der indogerm. Altertumskunde, Strassburg, 1901, p. 919; Hirt, Indogermanen, do. 1903-07, pp. 291, 638).

A survey of the terms just given shows that castration of human beings was performed in Europe only where Oriental influences were present; and in this case linguistic evidence is not contradicted by any facts thus far known. The reasons for the castration of animals were doubtless the same in early times as they are to-day: greater docility (notably in horses and oxen) and increased savouriness of meat (as in esop's.)

Turning to the subject proper of the present art.—the castrated human male, or emunh—it may be noted that the terms for 'emunh' give, with perhaps a single exception, no clue as to the reason for the institution of castration. The sources of Skr. vaḍḍari and of Gr. ἀδημός, ἄραμ, τοῦκασ, and σχιστός have already been given. The best known term of all, ἀφετρό, is of uncertain significance.

The old etymology, found as early as the Etymologicon Magnum—αφετρό τοῦρκας ἰγνωκαὶ ἡμᾶς ἡμᾶς καὶ πατριάδος καὶ γεωργίας—and still advanced by Taylor (E. T., art. 'Emunh'), by which the word means 'bed-warder,' merits no consideration. Perhaps the best suggestion is that advanced by Jensen, Z. A. I. [1899] 35, who regards ἀφετρό as a loan from a Persian word, 'wether' comparing Heb. יָפָר, יָפָר, 'trained,' 'trained,' 'experienced' (cf. Syr. ṯφάλαγον, 'emunh' (lit. 'trustworthy,' 'trusted'), and see Lawy. Sem. Fragm., p. 29). The Hebrew term for 'emunh' is שור, which is probably to be regarded, with Jensen, Z. A. VII. [1892] 174, note 1, as borrowed from Assy. ἱσθαν, 'to stand,' who he who stood (Heb. יָפָר). This is what this would explain all the offices and duties performed by the ϊσσος in the OT (cf. Zimmern, ZDMG liii. [1899] 116, note 2).

EF is, therefore, correct in rendering 'ἵσσος' by 'officer' or 'chamberlain' in the majority of its occurrences, reserving 'emunh' for passages in which this is obviously the meaning (2 K. 20:1 29:25; 26:16, 18; some passages, as Jer 29:31, 34, are equally susceptible of either rendering; in any case it seems unnecessary to accept Cheyne's suggestion (EBI 1427) that two words originally distinct have been fused in שור. The precise nature of the operation performed on the ancient Sem. emunh is uncertain, but from the antithesis, in De 20:15, of פָּר יָפָר כָּרָם הַשָּׁבַע, it is evident that both crushing of the testicles and ablation of the penis must have been among the methods employed (cf. also the Vulg. rendering of the passage, 'emunh, istrii vel amputata testiculn et absidiso ventero').

2. Physical and mental effects of castration.—If castration is performed before an age of sexual maturity, certain precautions are taken, the operation is not, surgically speaking, a very serious one, although the mortality is enormous among the unfortunate boys of the native races in the ancient oriental market. After puberty the operation becomes much more grave. In the case of boys, castration prevents the development of the secondary sex-characteristics—the growth of the beard.
and of hair on the body, and the change of the larynx, the enunci voice thus approaching the female timbre. Males castrated in adult life naturally have the sex characteristics of other men. Data are lacking with regard to the castration of girls, though analogically there should be no public or auxiliary hair, and no characteristic development of the pelvis and area of the phallic region. The secondary sex characteristics remain - in a certain approximation to the male type, as in the case of the castrated rabbit, in growth of hair and increase of body. Castration of the male does not immediately result in loss of libido. On the contrary, the castrate can for some time - at least a year - have sexual intercourse and emit a quasi-semen (probably the secretion of the prostate gland). Accordingly, in the degenerate days of the Roman Empire, eunuchs were regularly made, soon after reaching puberty, for the unprinted gratification of the royal and imperial harems. In males it is also often done to relieve urinary weakness (retention of urine, etc.). Oophorectomy for ovarian disease of the female hastens the physical changes usually ascribed to amenorrhea, unless, as is often done, a small portion of ovarian tissue is left in situ, or is grafted upon the uterine body.

The operation of castration affects the body chemistry (metabolism) very strongly. The phosphates in the urine and the carbonic acid in the expired breath diminish, while the weight of the body increases. Many spayed women grow fat and dyspeptic. Congestion to the head and thorax and excessive perspiration appear and may continue for years. Melancholy is developed in a large percentage of cases, together with loss of memory, irritability, impairment of vision, nightmares, insomnia, and skin affections.

On mentality castration appears to produce no essential change. It is true that eunuchs are usually inclined to be malevolent and unscrupulous, that they are apt to be either extremely abused or inordinately haughty. Yet this is due not so much to the physical results of the operation as to the fact that by the hand of their fellow-men they have been put out of their path of national supremacy, and they feel a not unnatural resentment, accentuated by the aloofness usually felt by all who are marked off, by mental or physical peculiarity, from the ordinary mass of mankind. Now, perhaps, the unity of native ability and acquired malignancy has been more strikingly exemplified than in the case of Ághá Múhammad, who, castrated in early life by Adil Shah, was able to found the Zend dynasty and, as far as 1796, to found in blood the Qajar house (cf. Horn, GIPR ii. 594-596). But that cruelty is an accident, and that mental and spiritual powers are unabated, is attested by the famous instances of Origin and Alebdar (qq.v.).

Certain peoples are reported to have practised the excision of one testicle only, as is recorded of the Hottentots by Kolben (Beschreib. des Vorzüglicher der guten Hoffnung, Frankfurt, 1745, p. 147). Their motive was to prevent the birth of twins, an event of such ill omen to many peoples (see TWINS) and, according to Rolben, adapted characteristics sexual.

The general function of eunuchs was to serve as a superior sort of slave, particularly in view of their sterility - as guardians of the harem. It would appear that the castration of human beings was first suggested by analogy with that of animals (cf. Xenophon, Cyrop. vii. v. 60-65) - it was supposed to make a man more amorous and affectionate and so priving them of the distractions of family life, to render them more faithful to their masters. But, effective as this proves in the case of animals, it is far otherwise in the case of man; and the history of the eunuchs is full of the most terrible histories of cruelty and darkened by utter corruption.

Where castration started is an unsolved question, but the tradition recorded by Ambrosius Marcellinus (xiv. vi. 17), that it was instituted by the legendary Semiramis, would seem to point to the Mesopotamian region as its first home. Eunuchs were early known in Assyria, where they apparently acted as generals and governors (Jansen, op. cit., xiii. 468). In Ethiopia (Ar. 568) in India at an early date (Magaháhratá i. 36. cf. 46); they exercised an evil power at the courts of Gordianus III., Constantius, Honorius, and Arcadius (Gibbon, Decline and Fall, chs. vii., xix., xxii.), and they were introduced into China in the 5th cent. B.C. (cf. Stent, Chines. Eunuch, Leipzig, 1879).

4. The eunuch-priest.

None more important in the present connexion - and far more difficult - is the problem of the origin of the eunuch priest. The Ephesian Artemis was served not only by virgins, but by eunuchs, the name of the latter - Myr̄γa (lit. 'Beghna'), 'having salvation through the Deity' (Justi, ibram. Namensbuch, Marburg, 1895, p. 571) - betraying their Oriental origin (Strabo, p. 641); and the priests of Atargatis were also eunuchs (cf. Stent, ib.); and the name held to have been called Hecate probably an amalgamation of the great mother-goddess of Asia Minor - worshipped at Lagina (the modern Ileina, 2 hours north of Stratonicea, Caria), had among her servants eunuchs and hierophants (cf. Leibn. Miss. aegypt., p. 111). The name is a corruption from the Hellenic word, by virtue of which our word, 'roll,' is merely fantastic (cf. Group, i. 42, note 5).

It is in the cult of Cybele (q.v.) that the question of the origin of the eunuch priest must centre. That Attis (q.v.), her male partner, castrated him-
self was the subject of very divergent conjectures in ancient times (E.R.E. ii. 217; Gruppe, 1842). The castration of a god is familiar from the Gr. legends regarding Uranos and Kronos (Gruppe, 386, 1114, note 1); although they have not the same significance as the semi-castration of Attis. The foundation of the myth of the mutilation of Uranos and Kronos is, however, as a violent separation of the earth and sky, which some races, for example the Pazyrynskys, suppose to have originally clasped each other in a close embrace (Fraser, Attis, p. 94; J.G. Frazer, London, 1897, p. 28; Lamb. Custom and Myth, do. 1894, p. 45 ff.; Myth, Ritual, and Religion, do. 1905, p. 290 ff.; for a convenient summary of the Pazyrynsk legend, see E.R.E. iv. 176). Gruppe (1102) is inclined to explain the stories as borrowed from a Sem. source given by Philo Bouleus, as quoted by Roschius, Frapp. extra, 5. c. 12, but Gruppe's explanation, that the series—Tu'mesos (Aristoph.), Eli. Deipn., 5. 337—was used independently, seems less likely than the interpretation advanced by Lang and Frazer. But, if the myth of the castration of Uranos and Kronos is so originated, it seems equally evident that the origin of the legend of the self-castration of Attis was etiological, so that, as Frazer declares (p. 215), it was the self-castration of Attis that is nearly always the attempt to account for the self-mutilation of his priests, who regularly castrated themselves on entering the service of the goddess.

But why, granting Frazer's explanation of the myth of the castration of Attis, did the galli castrate themselves? First of all, the galli were priests of Cybele, a mother-goddess. The cult of this divinity, especially at Rome, is fairly well known (E.R.E. ii. 217 f.; and esp. Hepding, op. cit.). It is generally acknowledged that the original castration of the galli took place probably on 24th March—the third day of the annual festival in honour of the Great Mother—the dies aconiuinus, which is traditionally due to the death of Attis, and on which her devotees, headed by the archigallus, gashed their bodies with potsherds or slashed them with knives to bespatter the altar and the sacred tree with their blood (cf. Frazer, 222, with references, to which may be added the quotations from Ambrosiatus by Camm, RILLE viii. 1903) 322, note 1). We also learn much concerning the galli from the Latin accounts of their proceedings (e.g. Lucret. ii. 600 ff.; Ovid, Fasti, iv. 181 ff.).

Here one feature must be deemed peculiarly significant, even though little attention seems thus far to have been given by those who have studied the Attis-Cybele cycle—the galli wear female garb.

After his castration Attis wore female clothing (Lucian, de Dea Syr.). The Men, cxx. (ed. Buhl) describes the galli as partim venusta malicribi ornati stola; Arnoldus (Adv. Gentes, v. 17), as wearing "volucra medullum velamenta lanarum"; and the pseudo-Cyprian (ad Senatorum ex Christiana religione ad idolum servitutem conversam, 9), as clad "tuncia multibibios." Most important of all in this connexion is St. Augustine (de Civ. Dei, vii. 20), who expresses his scorn of the galli, who, in their processions, were to be seen "multidia capillii, facie dejecta, fungitibus membris, incestae feminae." Small wonder that satirists and Christian apologists even charged the galli with immorality (Narsar. Epigr., Aed. 3-5; Justin Martyr, Apol. i. 27)—a charge that was renewed by Rosenbaum (Gesch. der Insermuse des Allerheiligen, Halle, 1845, p. 129), though there seems to be no certain evidence for the accusation.

In like manner those castrists who castrated themselves in honour of the Syrian Astarte of Hierapolis also wore female dress. The mutilation upon themselves, they ran through the city, carrying in their hands the severed parts, which they cast into some house; and the inmates were to be dressed in female attire and female adornments, which were worn by the eunuchs for the remainder of their lives (Lucian, li). Among the Ba-sudari and Ba-bwende of the Congo many youths are castrated in order to more freely approach the phallic worship, which increasingly prevails as we advance from the north to the south. These eunuchs or in some way deformed are sometimes dedicated to a goddess named Agddepta. The practice might be mistaken for women. Also men who are, or believe themselves to be, impotent will vow to dress as women in the hope of recovering their original strength (Frazer, 331, 341). In Pegu, at a feast called the 'collock', some women were chosen who served the god of the Dance to the Gods of the Earth. Hermaphrodites, who are numerous in this Country, are generally chosen, if there are now present to make a Set for the Dance (Hamil. New Account of the East Indies, Edinburgh, 1727, ii. 671).

What, then, is the origin of the eunuch priest, dedicated to a goddess of fertility, and clothed in female garb? Leaving out of account the African negro, which is probably connected with religious sodomy—a custom also widely spread among the ancient Semites and the American aborigines—and likewise dismissing as fantastic the theory reported by Hippolytus (Refut. omnium harr. v. 17), on Naassennian authority, that by his castration Attis was raised to the celestial essence, where, they say, there is no male or female, but a new creation, a new man, who is androgynus, we may note the principal explanations that have been advanced.

The Notion of Astarte (1542-1546) supposes that the self-castration of the galli was to secure chastity (cf. Hepding, 162), in conformity with an ascetic desire to renounce the joys of the world, although the idea of the marriage of Cybele and Attis still existed in the practice of burying the severed parts in the earth or in subterranean chambers sacred to Cybele. Westermanck (MI ii. 414) suggests that the eunuchization may have been due to the custom of the chastity of his or her servants, his basis being a theory of Lactantius (Div. Instit. i. 17): 'Deum mater et amavit formosum adolescentem, et eundem cum pelle deprehensam eexectis virilius seminivum reddidit; et idee nunc sacra eis galla sacerdotibus celebrantur' (further references in Gruppe, 1842, note 3). To say, with Jeremias (in Churerque de la Saussaye, Lehrbuch der Religionsgesch., Tubingen, 1865, i. 361), that 'self-castration is the dedication to the goddess (Astarte). The castrates are dedicated to the divinity like the Vestals,' is an ambiguous platitud. Fraser (p. 223) conjectures that the self-wounding of the galli, like the castrating of the other devotees, was intended to strengthen the dead Attis for his resurrection.

Wrought up to the highest pitch of religious excitement, they [the galli] dashed the severed portions of themselves against the image of the cruel goddess. These broken instruments of fertility were afterwards reverently wrapped and buried in the earth or in subterranean chambers sacred to Cybele, where, like the offering of blood, they may have been deemed instrumental in recalling Attis to life and hastening the general resurrection of nature, which was then bursting into leaf and blossom in the vernal sunshine. Some confirmation of this conjecture is furnished by the savage story that the mother of Attis conceived by putting in her bosom a pomegranate sprout from the severed genitals of a man-monster named Aegeas, a sort of double of Attis. If there is any depth in this conjectural explanation of the custom, we can readily understand why other Astarte goddesses of fertility were served in like manner by eunuch priests. These feminine castrated order of more strictly for themselves ministers, who personated the divine lovers, the means of discharging their beneficent functions; they had themselves to be impregnated by the life-giving energy before they could transmit it to the world.

Hepding, who, like a number of other scholars, derives the self-mutilation of Attis from the Semites (pp. 128, 161 f., 178, 217), attributes it in part to the anæsthesia-producing frenzy of the general chariot races (pp. 129 f., 100 f.); but this is only a partial explanation, applicable, indeed, to the castrating with sherds and
knives, but hardly sufficient to account for the great act of self-castration. He is, however, probably correct in maintaining (p. 127 f.) that this description of the eunuch-priest as the "impotent," a name given to those who had undergone castration, is derived from the time of Herodotus, whose account of the Attic myth (iv. 76) contains no intimation of any orgiastic gallic rites.

Yet all the theories seem inadequate, especially as they do not account for the subsequent donning of female dress and for the general adoption of feminism. The only explanation which seems to fit (ib., p. 304 f.) is that, in the case of the eunuch-priest (v. 330 f.), the sexual ablation having been accompanied by a mutilation sometimes (in Egypt as well as in Babylonia) with the removal of the organs which rendered them not only incapable of sexual intercourse, but of reproduction, they removed the organs which had rendered them conversely not of her sex, and whose ablation made them approximately similar to her. Another common factor may perhaps have been that they were thus also assimilated to her virgin attendants of true female sex.

If the explanation here favoured is correct, there would be an interesting analogy in the present writer's suggestion regarding the origin of the Australian operation of arthila (E.R.E. ii. 608 f.). Moreover, just as in the case of female circumcision (ib. 609), there seems to have been a later, reverse tendency to make the female and male types of the devotees of the same deity, as is perhaps exemplified in the Athabasca, adae. Natwi, v. 137; cf. also Gruppe, 1546, note 5, whose explanation of the form seems scarcely tenable.

Even within the history of Christianity sporadic instances of self-mutilation have occurred. Of these the best known is that of Origen, who, after being the first to perform the operation for the sake of the virginity of the young girls, gave occasion to the Council of Nice to renew the ancient prohibition against such practices; so that, when the Arians afterward ordained him (E.R.E. ii. 26), Theodoret, ib. 247, tells us, the Catholics generally declared such a consecration as unconsecrated (Bingham, Antiquitates of the Chr. Church, ed. R. Blomfield, Jr., Oxford, 1836, ii. 471).

This form of mutilation is, as is well known, the characteristic which gives its name to the fanatical Russian sect of Skoptsy (or eunuchators)—the writer's rendering, 'circumcisers,' in E.R.E. iii. 667 (wrong), is, in fact, the only one which besides an eunuch to avoid suspicion in his converse with the virgin Eustolium: but he was deposed from the ecclesiastical office for the fact, and gave occasion to the Council of Nice to renew the ancient prohibition against such practices; so that, when the Arians afterward ordained him, the Catholics generally declared such a consecration as unconsecrated (Bingham, Antiquitates of the Chr. Church, ed. R. Blomfield, Jr., Oxford, 1836, ii. 471).

Church, ed. R. Blomfield, Jr., Oxford, 1836, ii. 471).

The Skoptzy have not been the only ones who have donned woman's dress. According to Athenaeus (xii. 11 [p. 484]), the Egyptian so-called "Adrammeletes" who had once inhabited women in Lydia, 'using them instead of male eunuchs'; but the most interesting instance is that declared to exist among some Central Australian tribes.

On the authority of Purcell (Verh. der Berliner Gesellschaft für Anthrop. und Urgesch., 1883, iv. 97, and Orzechowski, loc. cit. 120) this is said to be the operation of eunutha, or spaying, is performed on certain selected girls from 10 to 12 years of age, the requisite organ being covered with emu feathers with a loop of hair at the end. This is thrust into the vagina and left there for some days, after which the old men pull it out, thus tearing away part of the womb. To three days later a small stone knife is inserted, and the neck of the womb is cut off, before uterine and vaginal discharges of grese or eagle-hawks being then introduced, and lumps of fat being used as salls. When the wound is healed, the sacred and consecrated circumcision (described in E.R.E. ii. 667 f.) is performed. The alleged purposes of this female castration is to prevent the women from being encumbered by children when going through dry and barren country; but, in view of the Australians do not know that procreation is connected with the sexual act (E.R.E. ii. 660 f.), this explanation must be accepted with reserves. Mitch-How (E.R.E. iv. 304 f.) describes a girl who had undergone this operation as having only slightly developed hips, breasts, and mons Veneris, and with some hairs growing on her chin. The purpose is said to be the furtherance of prostitution. The same authority was told by E. P. Ramsay, curator of the Sydney museum, that the well-known explorer MacGillivray has seen at Cape York a woman oophorectomized so as to prevent the birth of dumb children, herself having been born dumb. Similarly, Roberts cited by Bichoff in Müller's Archiv für Ästhet., Physiol. und wissensch. Medizin, 1848, p. clix f.) records having seen female eunuchs in India, who, under the name of "heralds," were kept for this purpose; and the women, whose age was about 25, approximately in lack of petric development, etc., very closely to the male type.

5. Castration as a punishment. Attention has already been drawn in the art. CRIMES AND PUNISHMENTS (vol. iv. pp. 303 ff.; may also be seen in fr. 3304 f.; cf. also ETHICS AND MORALITY [Celtic], III. § 7), to castration as a punishment. Except in Frisian law, where this was inflicted on a rober of a temple, being preliminary to the penalty of death, emasculation was normally a punishment for rape and similar crimes; and occasionally, as in Welsh law, it was inflicted only when the crime did not pay the heavy fines required.

In Egypt, according to Plutarchus (De Castra, vii. 12), in their next incarnation by being born kites, (which may mean either 'eunuch, 'impotent,' or even 'hernephrodyte'). The laws of Alfred the Great (ii. 25) punished by emasculation a servant who raped a female servant (MT f. 231), and all male relatives of a Chinaman convicted for treason were doomed to death, excepting the young boys, who were castrated for service in the Imperial palace (ib. i. 45, with reference).
Already in the Roman Empire both Domitian and Nero had made castration (Sueton. Domit. vii.; Dio Cass. lxvii. 2, lxviii. 2), and this prohibition was repeated in the Digest (xlviii. 8. 4. 2—'nemo liberum servumque invitus simumentem castrate debet'). In the early Church, the only exception being the practice of castrating boys to preserve their voices, notably for the papal choir. The authorities cited by St. Alfonso Liguori (Tent. sacri vel. iv. iv. no. 374) make the custom dependent on the question whether the public welfare promoted by the sweet singing of the castrati was of sufficient magnitude to render licit a grave mutilation. St. Alfonso himself inclines to the negative, and the whole practice was indefinitely condemned by Benedict XIV. (de Syn. dioces. xi. vii. no. 4 f.). Since that time there have been no castrati in the service of the Church, although the usually indefatigable custom of having male sopranos on the Italian operatic stage lingered on until late in the 19th century. Marriage of a castrato was declared invalid by the Constitution Cum frequenter of Sixtus v. (28th June 1587).

Ethical problem of castration has recently come to the front in the question of the sterilization of certain classes of criminals and defectives. The operation, called vasectomy, consists in making an incision into the scrotum and severing the vas deferens, the womb being closed by the contraction of the cremaster muscle, and no further medical attention being required. (A similar surgical operation on the female is coohysterectomy by dividing the Fallopian tubes.) Result of vasectomy is sterility, although ibibo is not impaired, and the sexual act may be performed just as before the operation, except that there is no emission of semen. Besides preventing the procreation of offspring likely to inherit the defective or criminal traits of their parents, vasectomy is said to put an end to such vices as onanism, and it is declared to be absolutely without prejudice to the physical or mental health of the patient (cf. Joun. Amer. Med. Assoc., 4th Dec. 1909; Maryland Med. Journ., Sept. 1910; Med. Record, 11th Feb. 1911; Pearson’s Med. 1910; Nov. 1909). The operation is widely advocated in the United States, and laws providing for it have been adopted by many individual States. Of these an excellent type is one passed in New York in 1906, the law having been introduced to the date of writing (April 1912), no provision whatever having been made for its enforcement, 'to authorize and provide for the sterilization of feeble-minded (including idiots, imbeciles, and morons), epileptics, rapists, certain criminals, and other defectives.'

After stating that the Board of Examiners shall consist of a surgeon and neurologist, appointed by the Governor and with the advice of the Senate, and acting with the Commission of Charities and Corrections—the duties being to examine into the mental and physical condition of the feebleminded, epileptic, certain criminal and other defective inmates confined in the State institutions, or institutions operated by the State in the counties and State—the law proceeds as follows: 'The criminals who shall come within the operation of this law shall be those who have been convicted of rape, or of such succession of offences against the criminal law as in the opinion of the board of examiners to be sufficient evidence of confirmed criminal tendencies.'

Upon application of the superintendent or other adminis- trative officer of the institution in which an inmate may be confined, or upon his own motion, the said board of examiners may meet to take an examination into the mental and physical condition of such inmates confined as above; and if said board of examiners, in conjunction with the chief medical officer of the institution, should find that said inmate is not suffering from such procreation is inadvisable, and that there is no probability that the condition of such inmate so to such an extent as to render procreation by such inmate advisable, it shall be lawful to perform such operation for the
EUNUCH (Muslim).

In general every mutilation of men and beasts was forbidden by the Prophet (e.g. al-Bukhārī, al-Dhahabī shoal-qud, 25). Moreover, if we may trust Muslim tradition, Muhammad expressly enjoined his followers not to make themselves or others eunuchs. One day Uthmān ibn Māz'ān asked permission from the Prophet to castrate himself that he might not be tempted to commit fornication; he could, however, be again castrated if necessary.

EUNUCH (Muslim).—In general every mutilation of men and beasts was forbidden by the Prophet (e.g. al-Bukhārī, al-Dhahabī shoal-qud, 25). Moreover, if we may trust Muslim tradition, Muhammad expressly enjoined his followers not to make themselves or others eunuchs. One day Uthmān ibn Māz'ān asked permission from the Prophet to castrate himself that he might not be tempted to commit fornication; he could, however, be again castrated if necessary. This appreciation has caused the continuation of this evil in a great part of the Muslim world; for the slave-traders in the Sudan and elsewhere, who castrated your young slaves for exportation, could expect enormous profits in consequence of this cruel mutilation. During the stay of J. L. Burckhardt in Upper Egypt in the autumn of 1813, the eunuchs who were carried from the Sudan to Egypt had been castrated either in the desert or before they arrived at the site of the city of Cairo, near Siāt chiefly inhabited by Christians. The operators in this latter place were two Coptic monks, who received the victims (little boys between the age of seven and twelve years) in their house immediately after the arrival of the caravans. Their profession was held in contempt even by the vilenst Egyptians (J. L. Burckhardt, Travels in Nubia, London, 1822, pp. 294-296). In the Arabian Nights' Entertainments it is told that slaves were also, notwithstanding the legal prohibition, sometimes punished with castration by their Muslim owners (e.g. The Thousand and One Nights, trans. by W. H. Muir, London, 1882, p. 324; cf. Burckhardt's remark on the castration of captives by Ghālib, the Sharīf of Mecca [Travels in Nubia, p. 296].

Eunuchs were employed by the Muslims either as guardians of their harems or as attendants of princes and in the houses of men of high rank and great wealth, or as guardians in sanctuaries. For the latter purpose they were sent as presents, especially to the sultans of Egypt, at the time of the marriages of princesses. In Cairo a holy relic, the so-called shirt of Muham- med, was guarded by a eunuch, who was sent for that purpose from Constantinople (see A. von Kremer, Ägypten, ii. 88).

Burckhardt, Kugler, and other travellers in Muslim countries have observed that eunuchs, on account of the important and con-
Euphemism

The religious aspect of the word, 'euphemism' may be defined as the use of names or words of good omen, instead of those of evil omen (though in practice it also includes the use of enigmatic words), the object being to avoid the dangers which are inherent in the use of the latter. The being thus named is flattered andconciliated and does not do harm, or he does not know that he is being referred to. Euphemism is not merely a substitute for the names of evil demons; it is an attempt to avoid the deleterious tendencies towards evil or demoniac beings in act.

In primitive thought, and surviving into much higher culture, a name is regarded as part of the personality of the being—god, spirit, or man—who bears it; or it is even identical with its owner's soul. Hence, according to the magical view of the universe so commonly entertained, knowledge and use of a name are bound to effect the owner of that name. It may be used in his presence to procure him power, or force him to do the bidding of him who utters it. But, on the other hand, when carelessly uttered, it may bring its owner unpleasantly near, or draw his attention to, or bring him into contact with or possession of, the utterer. Obedience by a spirit or demon to the pronouncing of his name was only on compulsion; and he was always watchful for any opportunity of falling upon him who spoke his name. Thus there was danger for the latter in using carelessly the names of dangerous beings. It brought them near, and they had an objection to their names being mentioned. In the Near East, there are many restrictions. Any taloned spirit, person, animal, or thing is apt to receive a circumscription or euphemistic name. Great precautions are taken by savages against disclosing their personal or secret names; hence many of them are known by nicknames or circumlocutions, and nothing is more common at certain times than a change of name, which may be used as a form of deceiving or even of making a person sick.

In many languages the same word stands for 'name' and 'soul.'
place of the Divine name in expletives, excalinations, etc., in popular speech—Eng. 'off' (Cow's bones); Germ. potz or kot (Gott, goddess), qvain, phlegm, and the like.

2. Supernatural beings.—Much more common is the use of euphemisms for the names of spirits, demons, fairies, etc. Thus in India the spirits of young men dying without becoming fathers are called 'fathers', 'fathers'; in India, the isis; Sikes, the spirits of substitutes. The euphemistic name, to leave the 243 sleep [1899] to some one.' (Crooke, P.E.R.i. ii, 523.) The Arabs and Syrians address the jinn, who are in all respects like our fairies (see Fairies), as 'sukhbrakan,' as 'blessed,' or 'blessed ones' (Lane-Poole, Arabian Society in the Middle Ages, 1883, p. 37; Hanauer, Folk-Lore of the Holy Land, 1907, p. 292). In modern Greece the Nereids, who also correspond to our fairies, are called generally in a euphemistic manner αράκσια, a name also applied to Lamos and other supernatural powers. Other names, corresponding to 'the Eumenides' and similar conciliatory, are γραναβρ, 'the Ladys of the Dark'; γκαλαναβρ, 'the kind-hearted ones' (αράκσια μας, 'our maidens'); γκαλαναβρατι, 'our good Queens'; γκαλαναβρατι, 'our good Ladys'—a name corresponding to αλ αν rage, in a way, all these names are 'others.'

As the women, (see Fairies), or the female personal name is generally avoided, and replaced by euphemisms. Death, being personified, or regarded as the work of spirits or evil-disposed beings, would, if mentioned directly, be apt to draw dangerous attention to him with evil consequences. The idea of the dread contagion of death (which forced all who handled the dead to be under taboo for a time), working even through the name (name and thing taboo), belongs to the idea of a dead man's name that would bring his spirit near the living. Among the Ainu figurative words are used for death, e.g. 'sleeping,' 'resting,' 'leaving the world behind' (Batachelor, Ainu of Japan, 1896, p. 212). Both in Melanesia and in Polynesia there is an unwillingness to speak directly of death, and the usual word for death, mate, is used only of the death of an animal or as a term of abuse.

Brown (Melanesiana and Polynesian, 1910, p. 404) gives the following euphemism for death: us morti, 'he has gone'; us morti fono (of an old one), 'he has gone to the council'; us gazodo (of a chief), 'the titles have passed away,' or us tappogoapogo, 'the titles are scattered about.'

In S. Africa, to die is 'to go home,' or 'not to look on the sun again,' or 'not to look on the women,' or 'to return to one's fathers' (Macdonald, JAR xx. [1891] 121; Casalis, Les Bassontos, Paris, 1836, p. 258). Among the Baganda, when a twin dies (an unlucky event), it is said that the child has 'died,' or 'passed away,' or 'gone to gather flowers,' and the death of a king is described as 'the fire is extinguished' (Rossoc, The Baganda, 1911, pp. 103, 125). When a sheep dies, lost its spirit should cause a woman to fall ill, she simply says, 'I am unable to unite with such a sheep' (ib. p. 290; cf. the saying in the Hebrides when a cow dies, 'it is lost').

In Burma, to die is 'to return' (i.e. to a state of bliss [Forbes, British Burma, 1878, p. 71]). Among the Chinese, dying is expressed by such phrases as 'to enter the measure' (i.e. the coffin), 'to leave the body,' 'to pass away,' while the coffin is euphemistically called 'boards of old age' (Friend, 'The Chinese,' 1896, p. 200; ib.); 'sleep,' 'a euphemism for death (Heb. כָּל, LXX θάνατος, 'in sleep,' and is constantly used: 2 S 17:2, 1 K 2:1, 2 Es 7:3; 1 Ki, xi. 241; Soph. Electra, 590; cf. Herkenrath, Stud. zu d. grch. Grabschriften, Feldkirch, 1898). St. Paul speaks of τον θανατον καὶ τον ψυχήν & θανατόν & θάνατον (1 Th 4:14); and these phrases passed readily into Christian thought, so that

Chinke, Wottkeren, Wouters (Grimm, 603.) The γνῆσις fuitusa regarded as a spire is also called familiarly 'Will o' the wisp,' 'Jorden's light,' etc.

In most European languages the devil is commonly spoken of by a variety of euphemisms and softened titles, which have a tendency to degenerate into slang, but which show the fear of using such a name of devil. In Scotland 'the good or good man' (cf. 'the good man's craft'—the part of a farmland left unencultivated because dedicated to the devil) probably expresses the devils tendency of hell ('the good man's lament'). Other names are 'Clootie,' 'Auld Iornie,' 'Sandy,' or 'the devil.' In the Hebrides such names as 'the brindled one,' 'the black one,' 'the great fellow,' (the nameless), are found (FL x. [1899] 265). English names are Old Nick,' 'the Old Gentleman.' In Germany we find Meister Peter, Meister Siech-fich-fur, Deichel, Gott sei beiseit, etc.; in France, dision, in Italy, ceterato (cf. Grimm, 987, 1904, 106; Hornemann, Slavische und its Analogien, 1890 ff. s.w.).

3. Death and the dead.—For similar reasons such ill-named names as death, the region of the dead, and also the personal name are generally avoided, and replaced by euphemisms. Death, being personified, or regarded as the work of spirits or evil-disposed beings, would, if mentioned directly, be apt to draw dangerous attention to him with evil consequences. The idea of the dread contagion of death (which forced all who handled the dead to be under taboo for a time), working even through the name (name and thing taboo), belongs to the idea of a dead man's name that would bring his spirit near the living. Among the Ainu figurative words are used for death, e.g. 'sleeping,' 'resting,' 'leaving the world behind' (Batchelor, Ainu of Japan, 1896, p. 212). Both in Melanesia and in Polynesia there is an unwillingness to speak directly of death, and the usual word for death, mate, is used only of the death of an animal or as a term of abuse.

Brown (Melanesiana and Polynesian, 1910, p. 404) gives the following euphemism for death: us morti, 'he has gone'; us morti fono (of an old one), 'he has gone to the council'; us gazodo (of a chief), 'the titles have passed away,' or us tappogoapogo, 'the titles are scattered about.'
BEPHISMUTH 587

'sleep' became almost an equivalent for death rather than a euphemism. 'To sleep in peace,' to 'fall asleep in Jesus,' are common phrases in Christian epigraphy from early times, and recepta ad Deum, "of the dead," etc. 

In the everyday speech of ourselves 'to pass away,' 'he is gone,' and the like, are used for death (cf. 'to pass out' or 'over,' used by Spiritualists); and in the north-east of Scotland 'he was taken away' means 'he died.' In Germany, death is known as Freund Hein, and dying is expressed by a variety of euphemisms—departing in various forms; cf. Gr. ἀπεθανεν ἡ γοια, 'faring out,' etc. Our 'to join the majority' occurs in German, and is derived from the Gr. phrase ι τὸν λαὸν λέγεται (cf. the Heb. euphemisms, 'gathered to his fathers,' 'go to his fathers,' 'sleep with his fathers,' etc.).

The reluctance to mention the dead individually or collectively by name is universal among savages and survives in folk-custom (see DEATH AND DISPOSAL OF THE DEAD [Intro.], vol. iv. p. 441).

Among the aborigines of Victoria a dead man was 'the lost one,' 'the poor fellow that is no more' (Stranahan, TES i. [1861] 299); and among the Abipones he is 'the man who does not now exist' (Dohhrizoff, Abipones, 1822, ii. 273). S. African tribes say 'ye who are above' (Macdonald, JA1 xx. 121). The Roman De Mores, 'the good or kindly gods' (from onys, 'good'), applied to the gods of the world or the departed, is probably euphemistic; and perhaps the Gr. ἐν τῶν ἀκρωτηρίων, οἱ κράτες ἐν των ἀναγυμνοσ, 'those below,' or 'those who have gone below,' are of the same nature. cf. κληρον, Lat. majoris, Eng. 'the majority,' are all circumlocutions for the dead. In Scots folk-speech 'them that's awa' expresses a similar reluctance to refer directly to the dead as such. In Japan the old word mone applied to the dead means 'the beings,' and is euphemistic (see EEF iv. 611). Offended spirits in China are addressed by a euphemism, e.g. shing jin, 'sagely person.' Similarly the region of the dead or of the devil is subject of euphemistic expressions in stead of the word 'hell'—'the ill place,' 'the bad place,' or even, as in the Hebrides, 'the good place.'

Diseases. Among savages, diseases are frequently personified or controlled by spirits, and in either case they are sometimes referred to euphemistically, by way of avoiding such a direct reference as might cause them to afflict the speaker, and also in order to flatter them. In Fiji the word 'leprosy' must not be applied to any one in good society who is suffering from it; and many ingenious shifts are resorted to in order to express the meaning without using the word. (Thomson, The Fijians, 1908, p. 259). Among the Dayaks, smallpox is not referred to directly, but as 'jungle-leaves,' 'the chief,' 'fruit'; or they ask, 'Has he left you yet?' (St. John, Forests of the Far East, 1802, i. 62.)

In India the name of the smallpox-goddess, Sitala, is itself a euphemism, 'she that loves coolness'; but she is also called 'queen of the world,' 'the great mother,' etc. Similarly euphemisms are used for leprosy in the Oldβ Βα (Crooke, PI. i. 126; cf. EEF ii. 485).

In the Cyclades, plague is the pardoned disease, epilepsy is θηριστήριον or τό καλό, smallpox εἰθύμα; and in consequence euphemistic terms are introduced into their popular language. In the flux of the disease, a similar custom is observed while hunting, fishing, or pursuing certain occupations in particular places or at particular times. But here the custom is not confined to the hillmen but spreads to the whole island. (Bent, The Cyclades, 1883, p. 74; Crooke, i. 129.) Among the Slavs, the demon of fever is called 'aunt,' 'godmother,' by way of making her friendly. The Teutons call disease 'the good,' 'the blessed;' pestilence is 'gossip,' 'apoplexy,' the blessed, whilow the unnamed' (Grüm, 1154, 1157, 1650).

5. Animals. The same custom applies to using the names of animals whose ravages are feared, as well as to other more harmless animals—in the latter case perhaps a survival of some religious tabus in the cult of animals. In India, the tiger is spoken of as nagana, 'sir,' and would punish any one who did not so call him (Monteiro, Angola and the River Congo, 1875, ii. 116). In Algeria, the same animal is called Johanen-el-Johan (Certeux and Carmoy, L'Algérie trait., Paris and Algiers, 1884, p. 172); and the Bechuanas of S. Africa name it 'the boy with the beard' (Conder, JAI xvi. [1857] 54). Among various peoples of Malaysia, the tiger is called 'grandfather,' 'the wild animal,' 'lord,' or 'ancestor,' or, as in Sunda, 'the whiskered one,' 'the honourable one,' etc. In Sunda, the boar is 'the beautiful one.' The Malays also call the elephant 'grandfather,' and beg him not to destroy them, his grandchildren. When calling an alligator, they conodel with him and call him 'Raja,' 'Datu,' and 'grandfather'; and in Sarawak the Kenyahs call the crocodile 'the old grand- father' rather than 'grandfather.' In Japan, such cases calamity or illness would follow non-observance of these euphemisms (Marsden, Sumatra, 1811, p. 292; Monhot, Trav. in Indo-China, 1884, i. 283; Sckener, Malay Magic, 1900, p. 150, 152, 157; St. John, i. 19; Hose-Macdouall, JAI xxi. 186; Frazer, GIP i. 462). For similar reasons, and lost the dreaded animals should appear, snakes in India are called by various euphemisms—the cobra is 'the good snake' or 'good lord'; and 'worm,' 'insect,' 'rope,' 'creeping thing' are other reptile euphemisms. Similarly among the Cherokee, when a man is bitten by a snake, he is said to be 'scratched by a biter,' a respect for the animal should be hurt (Mooney, RBBEW [1900] pt. i. p. 295). Tigers are called 'the dog,' 'the beast,' 'the jackal,' etc., especially when they are being hunted. Other animals are also denoted euphemistically (Crooke, PI. i. 275, TC, 1896, i. 249; FL viii. 285; NIQ 1, 70, 104, v. 133). In Syria, the serpent is addressed as 'Thou blessed one' (Hanauer, 202). Similar respectful names are applied to the 'forest apple,' 'golden light foot,' 'old man,' etc., while the Lapps call it 'the old man with the fur coat' (see the Kalevala, passion: Tylor, Early Hist. of Mankind, 1865, p. 140). Similar forms are used by the Esthonians and Prussians for the bear; and by all these peoples and also generally in Germany the wolf, especially at certain seasons, is called 'grey-legs,' 'golden-tooth,' 'the vermin,' etc., while the fox is 'long-tail,' 'blue-foot,' etc., address the bear or (possibly water-monsters, 'water-person' or 'water person female' (II RBBEW, p. 439).

6. Euphemisms of occupation, etc. Some of the above examples have shown that animals while being hunted are spoken of euphemistically, the object being apparently to deceive them by a kind of make-believe, so as to render their capture easy, while at the same time it is sought to avoid falling one's fingers into their paws. In the flux of the disease, a similar custom is observed while hunting, fishing, or pursuing certain occupations in particular places or at particular times. But here the custom is not confined to the hillmen but spreads to the whole island. (Bent, The Cyclades, 1883, p. 74; Crooke, i. 129.)
or things which might be mentioned in conversation. They are either not spoken of for the time being, or they are referred to under some other name, circumlocution, or euphemism. By this class is usually meant the word using the thought to deceive the spirits or animals or any other being who might be listening, and who, recognizing them or their intentions, would attack them, or avoid and escape them. Thus, if, while hunting, men call their dog 'devil,' or they have slain, or their weapons, by other names, they reckon on deceiving the animal and so obtaining an easy prey. Or, again, if the animal is spoken of in a flattering euphemism, it may be so pleased that it will allow itself to be slain. In other cases, where names of objects or people, allowable at other times, are taboo at certain times or in certain places, there is obviously a fear of disturbing harmful agencies to which they might be obvious. Here, again, the words used are euphemisms of pretence. The beings and creatures swarming about men, whether spirits or animals, are credited with intelligence and understanding. Above all things, the English are at a certain point. They are weak enough to be open to flattering terms, or ignorant enough not to see through man's elaborate pretences.

Two examples may suffice. Martin (Dearer of the W. Islands, London, 1710) refers to the custom of the Lemains, when visiting the sacred Fijian Islands for towing, of avoiding certain words, in employing others in the same places—such, to call 'clearer,' 'shore,' 'crusty,' 'hard,' 'for,' 'rock,' 'pale,' 'sharp,' 'for,' 'soul,' etc., while the islands themselves must be spoken of only as 'the country.' Similarly, the camp-fathers of the Malay Peninsula, while engaged in the hunt or the chase, the true word 'kill' and the euphemistic language, because otherwise the spirit in the trees would not be propitious, and they would not find the object of their quest. Rice is called 'grass fruit,' gun is 'far-sounding,' etc. In Borneo, and for similar reasons, the same phenomenon is met with, and camp-fathers here speak of 'the thing that smelleth' (Great. St. 212 ff.); Furness, Folk-lore in Borneo, Wallingford, Penn., 1899, p. 41. The Yoruba, in Nigeria, do not express their own name while fishing, but as such, to hide his identity from the spirits (J.A. xxxiv. 1900, 459). For many other examples, see also Fraser, I. 451 ff. note A. 'Taboo on Common Words.'

7. Certain religious, customary, or unusual actions or things are also spoken of euphemistically, and for reasons similar to those already referred to. Thus, in Samoa, circumlocution of a peculiar kind had a recognized name, teuf, but in ordinary speech tafso was used as a euphemism (Brown, 382 f.). In Fiji, cannibalism, which had a religious aspect, was hedged about by many tabus and euphemistic names. The food, for example, was not called ko run, the house that persecutes; the feet, nduia runa, one-two; or such a desired portion of human flesh as the breast of a virgin was said more euphemistically as 'the body of my beautiful' (Brown, 104). Among the Yorubas, human sacrifice is euphemistically called 'basket-sacrifice,' because the victim is enclosed in a basket (Ellis, Yoruba-speaking Peoples, 1894, p. 105). In the Hebrides, the fire of a kiln is called angwall, not because, Leibauer, the latter is dangerous and 'ill will come if it is mentioned,' (F.L. x. 263) just as, in Scandinavia, fire was sometimes called heta, not ed or ell (Thorpe, ii. 647 f.). The twin's name was exceptionally used, born—an unusual but important event, because they were the gift of the god Minkas—the midwife, in announcing the birth to the father, did not use the name, 'twin,' but he gave the impression of using some such phrase (Roeser, Zykwarda, 1911, p. 63).

8. Euphemisms of etiquette. — Etiquette also demands that, in speaking to a superior, particular names or phrases should be used instead of those ordinarily applied. In Samoa, when a man wishes to take a place at an archery meeting and is unable to do so, he should decline on the ground of being ill, and say, 'I am suffering from carrying firearms,' which means himself, and it has been adopted from the manner in which a peasant would speak, as a term of mock humility. This is only one example out of many customary in China (SBE xxvii. [1885] 101). Similarly, in Samoa, words of an opposite meaning instead of those supposed to be objectionable were used in such cases (Brown, 380 f.). For the same reason ill-omened words are generally avoided in conversation; 'good omen words,' in the Cantonese phrase, being used, as many of the above examples have shown. Halleins says that the Athenians were careful not to use words of ill-omen; so they called the prison 'the chamber,' and the executioner 'the public man' (Phot. Bid., ed. Bekker, 1825, p. 535). The underlying idea is that by mentioning ill-omened words the action may be itself produced. Survivals of this—but now more than a shrinking from the use of words calling up disagreeable associations or unpleasant things—are common in civilized life among ourselves. But the old and primitive conception of the connexion between name and thing named, and of the power of the name to produce the effect or to cause the presence of spirit, animal, etc., when the name is spoken, is seen in certain proper verbs, the full meaning of which is not realized by those who use them: e.g. Talk of the devil and you will see his horns; 'Speak of the wolf and you will see his tail.'

9. Slang and euphemism.—Euphemistic language may become merely poetical, and, while it has a different origin from slang, it is also closely connected with it and easily degenerates into it both in English and in foreign languages. The euphemistic names of the devil have in many instances become merely slang expressions, though sometimes used by those who think them softer than such a 'wearing word' as 'devil'; or they have given rise to other slang names. 'The dicken's, 'the dence,' 'dence takes it,' 'the old boy,' etc., and some of the euphemisms already cited for 'devil,' are examples of such changes. Many people also use slang euphemisms for oaths—'dash,' 'blow,' 'confound,' etc.; while there are many slang expressions for death—'to kick the bucket,' 'to take an earth bath,' 'to go to Davy Jones' locker,' etc.—which in an earlier age would have been euphemisms pure and simple. See Farmer-Henley, Slang and Its Analogues, 8 vols., 1890 ff.; J. C. Hotten, Slang Dictionary, 1859; A. Barriere and C. G. Leland, Dict. of Slang, Jargon, and Cant, 5 vols., 1885.

J. A. MacCulloch.

EURIPIDES, the last of the great Greek tragedians, is a figure of high importance in the history of Western thought, as well as in that of literature. The present article will say nothing of his life (b. before 475, d. 406 B.C.), his artistic technique, or his influence on the stage (of which 18 genuine and one suspect are extant), except in so far as they directly illustrate his ethical and religious position.

The real strength of a dramatist, for instance, is shown far more by his choice of subjects, and the kind of character that he makes (to use the technical term) 'sympathetic' or 'unsympathetic,' than by the definite sentiments he puts in his characters. We shall therefore, notice that Euripides has whole plays upon such subjects as the immorality of the traditional gods (Ion, Auge, Melanippe, Danae, Alceste); the problem of the unjust government of the world (Iphigenia in Tauris, Troades); the wickedness or insanity of the 'sacred duty of revenge' (Electra, Orestes, Alcestes; cf. Medea,
Hecuba, etc.). He once treats the statesman sympathetically (Philoctetes); mostly he dwells on the crimes of statecraft (Iphigenia in Aulis, Hecuba, Troades, Phæo, etc.), which he associates with such the prophecies of the suppliants at an altar (Heraclides, Supplïc, Andromache), or, when backed by superstition, with human sacrifice (Heraclides, Hecuba, Iphigenia in Aulis, etc.). His virulence and his mordant sarcasm are brought to stand against this background of statecraft. He treats often of cruelty and injustice done to women, especially barbarian women (Medea, Hecuba, Andromache), and sometimes of the women's fanatic revenge (Medea, Hecuba; cf. Ion). He has plays on the wise woman (Melanippe), the strong and bold woman (Melanippe), the wise faithful to death (Protesilaus, Alcestis; cf. Supplïc); on the women in love, innocently (Andromeda, perhaps Iphigenia in Aulis), or with some guilt or trouble (Hippolytus, Phæo, Orestes; also Aulid and Medea, Andromache). He has a great play entirely on the evil of war (Troy); two on the beauty and the horror of ecstatic religion (Bacche, Orestes); one in which the hero is a slave, though he proves to be the savior of his birth; and one dealing largely with the contrast of practical and contemplative life (Antiope). This is clearly an unusual and characteristic list of subjects.

Euripides as an artist deserves a much fuller treatment than he can receive here. In general, his characteristic is the combination of a highly conventionalized style with an extraordinarily free and original intellect. His technique is as severe as his thought is unconventional. His adherence to the archaic traditional forms of the religious ritual from which drama probably arose—prologue, contest-scene, messenger, epiphany of god or hero—is as marked as that of Æschylus, and forms a strong contrast with the more 'natural' style of Sophocles. His extreme pursuit of σωφρευγία, 'clarity,' makes his speeches often too precise and self-conscious, his scenes too sharply separate and articulate, for modern taste. On the other hand, the persistent thoughtfulness and keenness of his criticism of life alienate those who like poetry to be conventionally poetical.

In his religious and philosophical ideas, though Euripides is not an adherent of any definite school, he can safely be called the poet of the Sophistic movement. A σωφρευγία is one who 'makes wise,' and in his Philosophy there is the strong effort towards knowledge and enlightenment which transformed the half-savage Greece of the 6th cent. B.c. into the Greece of Hippocrates, Thucydides, and Plato. Different sophists, of course, emphasized different sides of σωφρευγία; but in its negative aspect the movement was largely one and indivisible. In an age saturated with superstition the first condition of real enlightenment is a drastic rejection of spiritual and intellectual fetters. Criticism attacks first what is immoral or revolting in the accepted beliefs, next what is merely stupid or improbable.

Now, Greek religious belief was never, except in some special communities (Orphie, Pythagorean, etc.), organized into a definite orthodoxy. It rested on innumerable local rituals conforming to a few main types, and explained by traditional stories. Naturally, the minds of most of the sophists probably agreed with Hecateus that the traditions of the Greeks are many and absurd; there was no great body of positive doctrine which attempts to make the non-existent believable was being destroyed. The Sophistic movement was, on the whole, agnostic. It urged men to look for evidence, to use their understanding and their moral sense. But it must always be remembered that the rejection of traditional theology in Greece proceeded almost as much from the craving for a more satisfying faith as from purely critical or scientific motives. There is a strong supposition that of Orphism and the great growth of mystic religions in the Hellenistic 4th century. And Euripides, being by profession not a dogmatic philosopher, but a philologist, and a realist and student of character, sensitive to all the highest thought of his age, reflects its aspirations quite as much as its denials.

Attempts have been made to show a special connexion between Euripides and the doctrines of particular philosophers (Anaxagoras: the sun as a χαλκωμένη βίον [Phæaon], 771, 783; Or. 983); Protagoras: the άνθρωπος μέτρον [Alcias, 19, Phem. 499]; Diogenes of Apollonia: the worship of άθηνα [fr. 941, 877; Ar. Ran., 492], the soul as air [Hel. 1013 ff.; Tro. 884-86, γι' άληθείας από τον πρώτον]; Heracleitus, Hippocrates, Proclus, and, in his political theories, Antiphon; cf. Dünzl., Proleg. zu Platon's Staat, 1801, pp. 101, 201 ff.; the Sophists: fr. 912, 475, and 638, 583; but the affiliation of each doctrine is often doubtful, their use is almost always dramatic, and the doctrines of no one school can be said to be professed with any great degree of assent. In the existence of the gods, the moral government of the world, the survival of the soul after death, Euripides is full of questions and contradictions, but pronounces no personal judgment.

A question that vexed the age was whether the world is governed by Intelligence (ζέων), or, more crudely, whether the gods were φαντάσματα, i.e. were they like reasonable parents knowing what is in man's heart, or, as the traditions would have it, innumerable incalculable creatures ready to punish savagely all who broke their irrational tabus? The question between monotheism and polytheism gives as little trouble to Euripides as to most Greeks; he uses the singular and the plural indifferently: θεός, in any case, was one. Euripides at times (Hep. 1103) 'has in his secret hope the belief in some great Understanding' (ζέων τοῦ θεοῦ). He is represented as actually praying to ζέων in Ar. R. 492. But he sometimes finds the facts against him (Hep. 18, cf. Iph. in Aulis, 3944; Her. 655).

Hecuba's often quoted lines (Troy. 884 ff.),

βασιλεία τοῦ ἀνθρώπου ἡ ζέων ἡμῶν ἡμῶν, ἡμῶν ἡμῶν,

"I base of the world in the world on the world. Whose thou art, unknown and hard of sunrise, Cause-chain of things (ἀρχές φαντάσματα) or man's own reason, God, I give thee worship, who by noiseless paths Of justice lead the ignorance that is the movement is the only express a belief, frequently repeated and denied elsewhere, in the rule of the world by Justice, but in the play the belief is quickly falsified by the event. Cf. the Letterphon, where the righteous hero questions Zeus on this point, and for answer is blasted by a thunderbolt.

If one is to try to conjecture Euripides' own view, it would perhaps be that unknown forces and influences do exist, which shape or destroy man's life, and which may perhaps be conceived as in some sense personal (διάπεκτον θεόν, μέν τις ποιεῖ ἐν τοῖς [Or. 415]), but that morally they are less good than man, who at least pities and tries to understand. At times, indeed, he deliberately quotes 'marvel- able tales of the poets: 'if the gods do shame, they are no gods' (Bell. 292); 'God, if he be indeed God, hath need of mght' (Her. 1349). Yet, not only the myths mete out the punishment, but Heracles, Electra) represented as very poor characters, but even the gods of the Hippolytus and Iphoche, who clearly represent real forces, if not quite real persons, by human standards evil. In the magnificent closing scene of the Trojan War we can see Euripides' enactment of the worship of the dead who may
still love us, then beyond to that a great refusal of all false comfort, an acceptance of the darkness that is God and more than God.

About immortality, Euripides often brings in scorn, pride, and, as we have shown, correct the life to be verily death, and our death life to those that are gone?; cf. Phæniz, fr. 816, Hip. 191), and thoughts of an impersonal immortality (Helen, 487-490) (esp. 488). He avails, hath consciousness (φρονεῖν) immortal, and being plunged into the immortal ether; cf. the 'other shapes of life in Ion, 1068, Med. 1039).

Next to the supernatural, sexual morality is the great field for talus and unreasoning judgments. Euripides' treatment of all such questions is by modern standards high and austere, but shows both sophist and romantic bias. He treats with sympathy, though with condemnation, the love of married women for men not their husbands (Phaedra, Stenebra; cf. Med. 635 ff.), but shows no tenderness for men in the same situation. He treats of love within the forbidden degrees (Canace and their emotions, and turn quickly to of heaven-sent madness, of that between Pasiphae and the Bull-god. He often treats legends of the children born of a god and a mortal woman (Creusa, Med. 635, 801, 606, as a case of a woman sympathetic and the god hateful, or, at least, suspect and imperfectly justified. Unlike Sophocles and Æschylus, he appears to have no tolerance of pedestrians, which he attributes only to the bestial Cyclops and, as a primeval sin, to Laius. (Gany- medes is mentioned in lyrics.)

Two social institutions of the 5th cent. especially provoked the criticism of sophists—slavery, and the subjugation of women. Both had been made to the rapid expansion of city life and commerce. Slavery is never expressly condemned as 'contrary to nature' in our remains of Euripides, though he probably shared this view; but his interest in the question is shown by the innumerable references to it. The influence of slavery is very bad, and most slaves are cowardly and untrustworthy (El. 633; fr. 86, etc.). Yet 'many slaves are better men than their masters' (fr. 511). 'Many so-called free men are slaves at heart.' 'A man without fear cannot be a slave.' More important than these abstract statements, which are naturally put as a rule into the mouths of slaves, is the presentation of the empathic 'sympathetic' slaves (esp. Alexandros, see above). The blind devotion of a slave is shown in the Iph. Asul., and the Ion (cf. Helen, 720 ff.). The women of Euripides are famous; they are more prominent in his plays than the men, more closely studied, and treated with more sympathy. Yet, magnificent as his heroines are, they suggest strange conclusions about the real Athenian woman of the 5th century. They are apt to be loving, courageous, clever, and often intellectual; but very ignorant and untrained, dis- contented, and instinctively ready to unite against the man who injures one of them. They are the slaves of their husbands, and turn quickly to treachery and crime (Creusa, Phædra, Electra, as well as the barbarians Medea and Hecuba). Even Iphigenia (Taurica) and Alcestis have their weakness and weakness are the 'bond, Hecuba in the Troades is extraordinarily noble, and so are the various virgin-martyrs. It is one of Euripides' chief glories as a dramatist that he so cleverly indiges in an ideally 'sympathetic' stage character any interest more than in stage villains. His strong symp- pathy with women made him understand them too well to draw them in the conventional man-attract- ing poses. This enables Aristophanes to represent him as a master of the art of the sex, who has dis- covered its secrets and betrayed them to the world (Themosphoriazusæ).

Two other questions which vitally interested Euripides were: (1) Is virtue teachable or purely innate? and (2) Is the current conception of a happy life, with its insistence on the possession of fame and glory, correct? He speculates several times, on the whole laying much stress on 'noble birth' (εὐγενεία), if only it is of the true inward sort (fr. 32, 617; El. 551, etc.). He generally inclines to the idea that only a wise man, means wisdom or 'culture,' but covers such qualities as 'gentleness' or 'mercy' (El. 294; Or. 491, etc.; Alc., 606, etc.); while ἀμδεῖα denotes brutality and cruelly (passim; cf. the uses of ἀρκεῖον, συμμορία, etc.). Yet he believes greatly in the virtue of 'those in the mean,' especially the free peasants who keep no slaves (ἀναστυφωτος; cf. El., first half; Suppl. 244; Or. 929). At times (Bac. 363, 428 ff., 1065 ff. (?); Suppl. 218; Hec. 1192) his characters even denounce the inadequacy or falseness of conventional σοφία. About children, and the intense happiness and more intense sorrow which they are apt to bring, he writes with peculiar interest (Med. 1195 ff.; fr. 608), as a case of a child. All the world (fr. 394 ff.; Andr., first half; Med., passim, esp. 1270 ff.; above all, Tro. 700-900).

We must not forget that Euripides was in the first place a dramatist and poet, only in the second a philosopher. His habitual subject-matter was the heroic saga, which uses supernatural machinery as a matter of course; and, though he cannot keep his mind from criticism, both moral and intellectual, of this subject-matter, his main business was not criticism: it was the writing of tragedy. Further, we must not suppose that a 5th cent. Greek, who rejected superstition and tried to follow σοφία, already possessed at once a scientific view of the world. He was only one of the pioneers who eventually made such a view possible. Euripides' habits of often opening with a prologue spoken by a supernatural being, and closing with the appearance of some god or hero in the air, who founds the ritual on which the play is based and explains its αἴρεσις (or legendary origin), belong rather to his technique than to his religion. In the development of Greek stage-craft they have their natural place (see note in J. E. Harrison, Themis, 1915, pp. 341-362), and theories which explain them away should be rejected. There are real difficulties, and each case requires separate treatment, but in general we ought probably to realize (1) that an epiphany was an integral part of the old saccer ludus from which tragedy is derived, and was usual in Ἀθηναία (This can be proved from the fragments.) Euripides only stiffened the convention and introduced improved machinery. (2) The epiphany is often beautiful and effective even by our standards; in other cases we must try to imagine what the effect may have been when the mechanical device was new and impressive, and the figure in the Divine mask corresponded with the ordinary man's instinctive expectations, and was not in the least degree inherently ridiculous. The thought of Euripides is in many ways so extraordinarily advanced, not only for his own age but for any succeeding age, that it is of the greatest importance to the pedagogi (gr.) and the present day, that it requires an effort to realize that in other respects he was probably, to our ideas, quite primitive and simple-minded. He was mystic as well as rationalist; his work, and, while recognising the Olympian mythology and the pretensions of the Delphian priests, it is surprising how often he falls back on some approach to the more primitive strata of religious thought. Apart from this, as a poet, as a playwright, Euripides' distinction as a poet lies partly in a sincerity which often makes him
spoil the harmony of his work rather than be content with mere make-believe, and partly in a lyrical gift which can transmute into beauty his most grisly representations of human suffering; but most of all in his unequalled emotional power. It is doubted if any later dramatist has been born to dispute his right to the tremendous title awarded him by Aristotle, who calls him, in spite of various faults, 'clearly the most tragic of the poets' (Poet. 1455c, 30).

**GILBERT MURRAY.**

**EUROPE.—We have seen (artt. Africa, Asia, and Ethnology, §§ 8 and 10) that the Caucasian discrimination of culture and race evolved and probably is in North Africa, whence it ranged in remote times eastwards into Asia and northwards into Europe. The latter continent was first reached by now vanished land connexions, in company with the large Pliocene or early Pleistocene fauna whose remains—elephant, hyena, rhinoceros, hippopotamus, cave-bear, sabre-tooth lion or tiger—are found in association with those of early man in many parts of South and West Europe. We thus get a vast antiquity (estimated by some authorities at three or four hundred millennia) for the first arrivals, the men of the *Palaeolithique, or Old Stone*, Age, which nearly coincided with the Ice Age, that is, with pre-, inter-, and post-glacial times. All were apparently of somewhat uniform long-headed type, but showed steady progressive developments, both in physical and in mental respects, from the rude *Chellean and Mousterian* to the more advanced *Solatrium and Madelenien* epochs.

The Old Stone Age was followed without any clear intermission of certain men who marked breakings of the faunal record (now rejected by all leading paleontologists), by the *Neolithic, or New Stone*, Age, which had also a very long duration, estimated by Sir W. Turner for Scotland alone at perhaps a hundred million years. For a long time Neolithic man was also of the same long-headed type, which in the Cro-Magnon race of Dordogne reveals physical characters that may be called 'European' in the modern sense of the term. Moreover, Quatre-fages, who connects all the human remains, both of the Old and of the New Stone Age, with 'the white type,' identifies the Cro-Magnon with the tall, long-headed, fair-skinned, and blue-eyed Berbers (Himites) who still survive in various parts of Mauretania. These Neo-Lithic African peoples are also credited the megalithic monuments—dolmens, menhirs, cycloiths, triliths, barrows, galeries de passage—found in the Iberia, Gaul, Britain, Denmark, and Sweden, and which in North Africa range from the Atlantic seaboard to Tripolitana. It follows that the men of these regions long ago were related to the present inhabitants of South and West Europe, and that they are, for the most part, of North African origin.

But before the close of the New Stone Age the uniformity of the long-headed type was disturbed by the advent of numerous short-headed peoples, both in the North-west (Furuz, Belgium) and in the South (Lozère, Lower Rhone Valley). These everywhere intermingled with the earlier long-headed type, and later became continually more numerous, until, 'towards the close of the Neolithic Age in France, the round and medium types became eight or ten times more numerous than the long in certain parts' (*P. Salmon, Races humaines préhistoriques*, p. 39). In Britain the earlier long barsrows are occupied exclusively by long-heads, the later round barsrows chiefly by round-heads, whence Thurnam's dictum: 'Long barrow, long skull; round barrow, round skull.' In France Paul Raymond, who separates the northern short-heads from the southern long-heads by a diagonal drawn from Cohentin to the Maritime Alps, has recently discovered several short-heads commingled with long-heads in the sepulchral cave of Lirac (Départ. Gard), and infers that 'vers la fin de la période néolithique vivaient dans la sudest de la France des populations dolchoscopihes qui présentaient les caractères de la race des Baumans-Auréliens (Cro-Magnon type), avec les variations que leur avaient imprégnées le croisement de brachycephaliques immigrés' (*Revue préhistorique*, Jan. 1906, p. 56).

As these Southern short-heads appear to have penetrated inland by the Rhone Valley from the south coast, they too may have come from North Africa, where a very ancient short-headed type, representing the Libyans proper and ranging into the Canary Islands, still forms the substratum in Tunisia and Kabylia, and is declared by Collignon to be remarkably like the short-headed brown French type:

'Si Ton habitait ces hommes de vêtements européens, vous ne les distinguerez pas de payans ou de soldats français' (*L'Anthrop.*, 1907, p. 474). It is generally admitted that the more numerous Northern short-heads of Europe, coming by the Danube route, in the Bronze Age some four or five thousand years ago. These ranged over a vast area in East and Central Europe, and many passed westwards through Britain into Britain, where they had been preceded by the Afro-European of both Stone Ages. Other Asiaties of a long-headed type arrived, also in the Bronze Age, or perhaps even earlier, by a northern route, and occupied the Baltic lands and Scandinavia, where they are now represented by the North Germans and Norsemen, of tall stature, fair or florid complexion, and blue eyes—Linne's typical *Homo Europaeus*. Lastly, another race of Orientation, following a southern route through Asia Minor, made its way into the Balkan region, and thence into the peninsulas of Greece and Italy, where they had been preceded by the men of the Stone Ages from North Africa.

We thus see that Europe was first settled in the south and west by North African Hamites, who came later to be known as *Pelagians* in Greece, *Ligurians* in Italy, and *Iberians* in Spain; in the east and north by Asiaties, who may now be called *Eurasians*, since their original domain comprised the whole of the Stephn-lands between the Carpathians in Europe and the Pamirs in Central Asia (Schrader). They are also commonly called *Aryans*, because all the Eurasians spoke various diverging dialects of the long extinct *Aryan* stock language. But it is obvious that, strictly speaking, 'Aryan' can be only a linguistic and not an ethnical expression, since it was seen above that the Eurasians were not of one but of two distinct physical types—short-heads and long-heads. Hence, when we speak of the Aryans, we usually mean very mixed populations of a roughly uniform Caucasian type, and of uniform Aryan speech.

It is more important to note that these Eurasians, coming in the Bronze Age, and consequently more highly cultured and equipped with better weapons for warfare, everywhere conquered the ruder Afro-European Hamites, imposed their Aryan languages
On them, and in the process merged with them into various mixed ethnic groups, which differed from each other in accordance with their different constituent elements. Thus was brought about in remote pre-historic times the Aryanization of Europe. This was considerably assisted, excluding the much later intrusion of the Finno-Ugric languages, the only non-Aryan form of speech still surviving in Europe is Basque (q.v.), which is spoken by a scattered population of the Western Pyrenees region. Basque, which represents all that remains of the old Iberian language, and is distantly related to the Berber (Hamitic) still current nearly everywhere in North Africa (G. von der Gabelen, M. Géze, Morris Jones, and others). Other survivals may have been the Pictish of Britain, since Prof. J. Rhys thinks that 'Picts and Iberians belonged to one and the same family which I have ventured to call Ibero-Pictish' (Academy, 26th Sept. 1891); and the Pelasgians of Greece, whom W. Wachsmuth calls 'ante-Hellenic,' and of whom Herodotus writes that, according to some evidence, they were the Pelasgi or Pamphylios (Homo Magnus) (l. c. 57). For Homer these Pelasgians were Eeio (H. ii. 4. 429; Od. xii. 177); for Herodotus 'barbarians' (loc. cit.), and for Dionysius Hal. (18 f.) 'Greeks' (tqj wv Pelas- gow evpEivov). Such apparently contradictory descriptions only mean that during the course of ages, the pre-Aryan inhabitants of Europe were gradually absorbed and assimilated by the Asiatic intruders of Aryan speech.

This rapid outline explains and agrees with the three great ethnical divisions proposed by Ripley, Sergi, and other leading ethnologists for the historical European populations. These are (1) the tall, fair, long-headed northern type, for which de Lacoste has written 'Homo Alpinus,' and to which Ripley applies the term 'Teutonic,' because the whole combination of physical characteristics 'accords exactly with the descriptions handed down to us by the ancients.' Thus Tacitus: 'omnibus truces et caerulei oculi, rutilae coma, magna corpora, et tantum ad imputem valid'a (Germania, iv.).—(2) The central zone of medium-sized roundheads with light brown or chestnut hair, brownish skin, and grey or hazel eyes, the Celts or Celto-Slavs of Broca, the Ligurians or Arvernians of Beddeoe, and whom, for want of a better name, Ripley calls Homo Alpinus, though also comprising the Slavs of the eastern plains. These are the short-headed, dark-skinned people from Asia, which may be supposed to have joined hands in the central European uplands, where are met the most pronounced round skulls (hypertrochicephalie in Tirol and Switzerland).—(3) The southern zone of undersized, pale, black-eyed, and black-haired long-headers, who are the primitive Afro-European element in Greece, Italy, Sicily, Sardinia, Corsica, Iberia, West France, and Britain, and are now generally identified with the above-mentioned Pelasgians, Ligurians, and Iberians, who were afterwards modified by Aryan intermingleings, but are grouped together by Sergi, Keane, and Ripley as 'Mediterrenean.'

All the present Aryanized inhabitants of Europe, that is, the vast majority, may now be conveniently tabulated in accordance with these three anthropological divisions as follows:

2. Homo Alpinus (Celt-Slav): most French, Bretons, and Alsacians, South Germans, Swiss, Tiroles, Austrians, Russians, Lithuanians, Poles, Czechs (Bohemians), Croats, Servians, Danes, Montenegrins, some Albanians, Bulgarians, and Roumanians.
3. Homo Mediterraneus (Ibero-Liguro-Pelagian): most Iberians, Corsicans, Sardinians, Sicilians, Epiretos (South Albanians), and Greeks.

On the linguistic basis the groupings naturally vary with the different views taken by philologists regarding the order in which the various members of the Aryan family branched off from the extinct mother-tongue. On this point there is still little accord, although it is generally allowed that, of the six recognized branches, Hellenic, Slavic, and Litho-Lettic are more closely related to one another than they are to the Italic, Teutonic, and Conic branches. The Western Pyrenean—those living in the Netherlands and a western branch, which, with their numerous sub-groups, may here be tabulated:

**AYRAN LANGUAGES FAMILY: EUROPEAN SECTION.**

**Eastern Division**

**Slavic branch:** Old Slavic, Russian, Little Russian, Bulgarian, Slovenian, Servo-Croatian, Czech (Bohemian), Polish, Polishish, Lithuanian, Latvian.

**Lithuanian branch:** Lithuanian, Latvian, Prussian (Old Prussian).

**German branch:** Old German Group: Dutch, Old Norse, Icelandic, Danish, Swedish, High, Low, Platt-Dutch, Dutch, Anglo-Saxon, English.

**Danish branch:** Danish, High German Group: Low Saxon, Frisic, Platt-Deutsch, English.

**Western Division**

**Slavic branch:** Old Slavic, Russian, Little Russian, Bulgarian, Slovenian, Servo-Croatian, Czech (Bohemian), Polish, Polishish, Lithuanian, Latvian.

**Teutonic branch:** Low German Group: Gothic, Old Norse, Icelandic, Danish, Swedish, High, Low, Platt-Dutch, Dutch, Anglo-Saxon, English.

**Italian branch:** Italian, Latin, Ocean, Umbrian, Italian, French, Spanish, Portuguese, Romancsh, Walloon, Roumanian.

**Bulgarian branch:** Bulgarian, Serbo-Croatian, Hungarian, Thuringian, Swabian, Swiss, Tirolean, Austrian.

**Celtic branch:** Old Irish, Irish, Gaelic (Gael), Manx.

**Welsh branch:** Welsh, Cornish (extinct), Low Breton.

Besides the already mentioned Basques, the only non-Aryans now in Europe are the Baltic and other Finns the Lapps, Samoyed, and Magyars of Hungary, now assimilated to the normal European type but still speaking a Ugro-Finnic language, the Osmani Turks, also largely Europeanized but not Aryansized, and lastly a few Kirghiz (Turkish) and Kalmuk (Mongol) nomads in Astrakhan. All these arrived from Asia in relatively late historic times, and can in no sense be regarded as European aborigines. The distinction of the others there is no question—it is important to note that the views formerly held regarding a western extension of the Finnic race over the whole of Europe and the British Isles are now exploded.

1. Despite the fact that all the Finns are distinctly round-headed, they were identified first with the long-headed cave-dwellers, who retreated northwards, and latterly with the Ugros tribe of the north, for whose sake the Finnic tongue, which has nothing in common and half the myths, folklore, and legendary heroes of the western nations were traced to Finno-ugrian sources (Keane, Men Past and Present, p. 364).

2. In fact, recent research has shown that the advent of the Finns in Finland itself dates only from about the new era, and the men of the Bronze Age in this region were not Finns but Teutons (A. Hackmann, Die Bronzezeit Finnlands, 1897, passim). Tacitus (Germ. xvi.) does not know whether his Fenni (Ptolemies's Fvvo) were Germans or Sarmatians (Slavs); but the reference to the children's cradles suspended from the branches of trees shows that they were the Σπελαηφοροι of Procopius (de Bell. Goth. II. 15), and the Sciride-Finnns of King Alfred (Orosius, l. 12), that is, the Lapps, who are still always called Finns by the Norwegians.

During the slow process of fusion between the Afro-European indigenes and the European intruders, their religious faiths all became early intermingled, so that the pre-Christian forms of belief were all of a mixed character like those described in art. *Aborigines*. Even after the fusion, further intermingleings took place through
infiltrations from Egypt and Persia, and, more especially, from the Semitic world. Nor were these later influences confined to the contiguous Hellenic and Aryan lands, but were carried by the Phoenician seafarers westwards to Iberia and the British Isles, when they are reflected in the national legends and even in the very language of the Celtic-speaking natives of Ireland, e.g. Bal Dhia dhuil, ‘God Baal to you’; and there is a district in Ireland which is called Béal-ochtú, ‘Field of the worship of Baal.’ Elsewhere this Baal-cult was associated with phallic rites, as in Phoenicia.

To discriminate between all these heterogeneous elements is no longer possible, though it seems safe to say that the higher forms—the Olympian deities and personifications of the natural forces—came in with the more cultured Eurasians, and were by them superimposed on the rude animism and the chthonic gods of the Euro-Africans, while the mysteries and degrading rites of the Cabiri, of Dionysus, Astarte, and the worshippers of Mithra and Isis (these twice expelled from Rome), were introduced by Oriental origin. Thus the compound forms Δυσαζίας, Ζεῦ-ταρε, Δίς-πιτερ (Jupiter), show at once that Jove was already dominant before the Aryan dispersion, and subsequently assimilated by other Euro-Africans, by whom his supremacy was spread north, through Lithuania (Dacieza) to Scandinavia (Týr), Germany (Ziu), and west to Britain (A.S. Tuesedeg, Eng. Tuesday = ‘day of Týr’) and Ireland, where das retains all the associated meanings—sky, or ‘heaven’, ‘day’, and ‘god.’ On the other hand, Jove’s counterpart, the goddess Ertha (Herthas, Earth), was clearly an Aryan-European divinity, since she was worshipped by the whole Celtic-speaking region as human sacrifice in some customary wood, with the Veđic and other proto-Aryans, and has been identified with Rhea, Ops, Demeter, Cybele, and other distinctly chthonic divinities. But she was early added by the Eurasians to their pantheon, for Tacitus tells us (Germ. xl) that the Angli (Continental English) ‘Herthum (variant Erthum), id est, Terram matrem, colonum.’ He adds that the rites observed in her honour on an island in the ocean (Kiügen) concluded with the sacrifice of the attendant slaves, whom the lake in her hallowed grove (castum nemus) ‘swallowed up.’ With this should be compared the orgies practised by the Celts in honour of Cuile, daughter of Terra, or Terra herself, in Phrygia and Thrace, whose worship passed into Greece (Elesinian mysteries), and thence into Italy, where her shrine was annually cleansed by the waters of the river Almo, just as Ertha’s chariot and raiment were cleansed in the above-mentioned lake at the foot of a high cliff which to this day is called ‘Ertha’s rock.’ The Italic ‘Ertha’ was called Bona Dea, and her non-Aryan origin is admitted, as is also that of the Irish chthonic goddess Morrigan, the ‘Great Queen,’ who has been identified with Cybele.
